If our planned business activities in China fall within a restricted category under the China Catalog for Guidance for Foreign Investment, we will need to operate in China through a variable interest entity ("VIE") structure.

The China Catalog for Guidance for Foreign Investment sets forth the industries and sectors that the Chinese government encourages and restricts with respect to foreign investment and participation. The Catalog for Guidance for Foreign Investment is subject to revision from time to time by the China Ministry of Commerce. While we currently do not believe the development and marketing of roxadustat falls within a restricted category under the Catalog for Guidance for Foreign Investment, if roxadustat does fall under such a restricted category, we will need to operate in China through a VIE structure. A VIE structure involves a wholly foreign-owned enterprise that would control and receive the economic benefits of a domestic Chinese company through various contractual relationships. Such a structure would subject us to a number of risks that may have an adverse effect on our business, including that the Chinese government may determine that such contractual arrangements do not comply with applicable regulations, Chinese tax authorities may require us to pay additional taxes, shareholders of our VIEs may have potential conflicts of interest with us, and we may lose the ability to use and enjoy assets held by our VIEs that are important to the operations of our business if such entities go bankrupt or become subject to dissolution or liquidation proceedings. VIE structures in China have come under increasing scrutiny from accounting firms and the SEC staff. If we do attempt to use a VIE structure and are unsuccessful in structuring it so as to qualify as a VIE, we would not be able to consolidate the financial statements of the VIE with our financial statements, which could have a material adverse effect on our operating results and financial condition.

FibroGen Beijing would be subject to restrictions on paying dividends or making other payments to us, which may restrict our ability to satisfy our liquidity requirements.

We plan to conduct all of our business in China through FibroGen China Anemia Holdings, Ltd. and FibroGen Beijing. We may rely on dividends and royalties paid by FibroGen Beijing for a portion of our cash needs, including the funds necessary to service any debt we may incur and to pay our operating expenses. The payment of dividends by FibroGen Beijing is subject to limitations. Regulations in China currently permit payment of dividends only out of accumulated profits as determined in accordance with accounting standards and regulations in China. FibroGen Beijing is not permitted to distribute any profits until losses from prior fiscal years have been recouped and in any event must maintain certain minimum capital requirements. FibroGen Beijing is also required to set aside at least 10.0% of its after-tax profit based on Chinese accounting standards each year to its statutory reserve fund until the cumulative amount of such reserves reaches 50.0% of its registered capital. Statutory reserves are not distributable as cash dividends. In addition, if FibroGen Beijing incurs debt on its own behalf in the future, the agreements governing such debt may restrict its ability to pay dividends or make other distributions to us. As of March 31, 2019, approximately \$6.6 million of our cash and cash equivalents is held in China.

Any capital contributions from us to FibroGen Beijing must be approved by the Ministry of Commerce in China, and failure to obtain such approval may materially and adversely affect the liquidity position of FibroGen Beijing.

The Ministry of Commerce in China or its local counterpart must approve the amount and use of any capital contributions from us to FibroGen Beijing, and there can be no assurance that we will be able to complete the necessary government registrations and obtain the necessary government approvals on a timely basis, or at all. If we fail to do so, we may not be able to contribute additional capital to fund our Chinese operations, and the liquidity and financial position of FibroGen Beijing may be materially and adversely affected.

We may be subject to currency exchange rate fluctuations and currency exchange restrictions with respect to our operations in China, which could adversely affect our financial performance.

If roxadustat is approved for sale in China, most of our product sales will occur in local Chinese currency and our operating results will be subject to volatility from currency exchange rate fluctuations. To date, we have not hedged against the risks associated with fluctuations in exchange rates and, therefore, exchange rate fluctuations could have an adverse impact on our future operating results. Changes in value of the Renminbi against the U.S. dollar, Euro and other currencies is affected by, among other things, changes in China's political and economic conditions. Currently, the Renminbi is permitted to fluctuate within a narrow and managed band against a basket of certain foreign currencies. Any significant currency exchange rate fluctuations may have a material adverse effect on our business and financial condition.

11/4/21, 2:41 PM Case 3:21-cv-02623-EMC Document fell-1100 Fided 30/11/11/4/22 Page 2 of 1730

Table of Contents

In addition, the Chinese government imposes controls on the convertibility of the Renminbi into foreign currencies and the remittance of foreign currency out of China for certain transactions. Shortages in the availability of foreign currency may restrict the ability of FibroGen Beijing to remit sufficient foreign currency to pay dividends or other payments to us, or otherwise satisfy their foreign currency-denominated obligations. Under existing Chinese foreign exchange regulations, payments of current account items, including profit distributions, interest payments and balance of trade, can be made in foreign currencies without prior approval from the State Administration of Foreign Exchange ("SAFE") by complying with certain procedural requirements. However, approval from SAFE or its local branch is required where Renminbi is to be converted into foreign currency and remitted out of China to pay capital expenses such as the repayment of loans denominated in foreign currencies. The Chinese government may also at its discretion restrict access in the future to foreign currencies for current account transactions. If the foreign exchange control system prevents us from obtaining sufficient foreign currency to satisfy our operational requirements, our liquidity and financial position may be materially and adversely affected.

Because FibroGen Beijing's funds are held in banks that do not provide insurance, the failure of any bank in which FibroGen Beijing deposits its funds could adversely affect our business.

Banks and other financial institutions in China do not provide insurance for funds held on deposit. As a result, in the event of a bank failure, FibroGen Beijing may not have access to funds on deposit. Depending upon the amount of money FibroGen Beijing maintains in a bank that fails, its inability to have access to cash could materially impair its operations.

We may be subject to tax inefficiencies associated with our offshore corporate structure.

The tax regulations of the U.S. and other jurisdictions in which we operate are extremely complex and subject to change. New laws, new interpretations of existing laws, such as the Base Erosion Profit Shifting project initiated by the Organization for Economic Cooperation and Development, and any legislation proposed by the relevant taxing authorities, or limitations on our ability to structure our operations and intercompany transactions may lead to inefficient tax treatment of our revenue, profits, royalties, and distributions, if any are achieved.

In addition, we and our foreign subsidiaries have various intercompany transactions. We may not be able to obtain certain benefits under relevant tax treaties to avoid double taxation on certain transactions among our subsidiaries. If we are not able to avail ourselves to the tax treaties, we could be subject to additional taxes, which could adversely affect our financial condition and results of operations.

On December 22, 2017, the U.S. enacted the Tax Cuts and Jobs Act ("Tax Act") that instituted fundamental changes to the taxation of multinational corporations. The Tax Act includes changes to the taxation of foreign earnings by implementing a dividend exemption system, expansion of the current anti-deferral rules, a minimum tax on low-taxed foreign earnings and new measures to deter base erosion. The Tax Act also includes a permanent reduction in the corporate tax rate to 21%, repeal of the corporate alternative minimum tax, expensing of capital investment, and limitation of the deduction for interest expense. Furthermore, as part of the transition to the new tax system, a one-time transition tax is imposed on a U.S. shareholder's historical undistributed earnings of foreign affiliates. Although the Tax Act is generally effective January 1, 2018, GAAP requires recognition of the tax effects of new legislation during the reporting period that includes the enactment date, which was December 22, 2017.

As a result of the impacts of the Tax Act, the SEC provided guidance that allows us to record provisional amounts for those impacts, with the requirement that the accounting be completed in a period not to exceed one year from the date of enactment. As of December 31, 2018, we completed our analysis of the accounting for the tax effects of the Tax Act and no material adjustments were recognized as of December 31, 2018. The primary impact of the Tax Act relates to the re-measurement of deferred tax assets and liabilities resulting from the change in the corporate tax rate ("Corporate Tax Rate Change"), which was recorded as of December 2017. Developing interpretations of the provisions of the Tax Act, changes to U.S. Treasury regulations, administrative interpretations, or court decisions interpreting the Tax Act in the future periods may require further adjustments to our analysis.

Our foreign operations, particularly those in China, are subject to significant risks involving the protection of intellectual property.

We seek to protect the products and technology that we consider important to our business by pursuing patent applications in China and other countries, relying on trade secrets or pharmaceutical regulatory protection or employing a combination of these methods. We note that the filing of a patent application does not mean that we will be granted a patent, or that any patent eventually granted will be as broad as requested in the patent application or will be sufficient to protect our technology. There are a number of factors that could cause our patents, if granted, to become invalid or unenforceable or that could cause our patent applications not to be granted, including known or unknown prior art, deficiencies in the patent application, or lack of originality of the technology. Furthermore, the terms of our patents are limited. The patents we hold and the patents that may be granted from our currently pending patent applications have, absent any patent term adjustment or extension, a twenty-year protection period starting from the date of application.

Intellectual property rights and confidentiality protections in China may not be as effective as those in the U.S. or other countries for many reasons, including lack of procedural rules for discovery and evidence, low damage awards, and lack of judicial independence. Implementation and enforcement of China intellectual property laws have historically been deficient and ineffective and may be hampered by corruption and local protectionism. Policing unauthorized use of proprietary technology is difficult and expensive, and we may need to resort to litigation to enforce or defend patents issued to us or to determine the enforceability and validity of our proprietary rights or those of others. The experience and capabilities of China courts in handling intellectual property litigation varies and outcomes are unpredictable. An adverse determination in any such litigation could materially impair our intellectual property rights and may harm our business.

We are subject to laws and regulations governing corruption, which will require us to develop, maintain, and implement costly compliance programs.

We must comply with a wide range of laws and regulations to prevent corruption, bribery, and other unethical business practices, including the FCPA, anti-bribery and anti-corruption laws in other countries, particularly China. The creation and implementation of international business practices compliance programs is costly and such programs are difficult to enforce, particularly where reliance on third parties is required.

Anti-bribery laws prohibit us, our employees, and some of our agents or representatives from offering or providing any personal benefit to covered government officials to influence their performance of their duties or induce them to serve interests other than the missions of the public organizations in which they serve. Certain commercial bribery rules also prohibit offering or providing any personal benefit to employees and representatives of commercial companies to influence their performance of their duties or induce them to serve interests other than their employers. The FCPA also obligates companies whose securities are listed in the U.S. to comply with certain accounting provisions requiring us to maintain books and records that accurately and fairly reflect all transactions of the corporation, including international subsidiaries, and devise and maintain an adequate system of internal accounting controls for international operations. The anti-bribery provisions of the FCPA are enforced primarily by the Department of Justice. The SEC is involved with enforcement of the books and records provisions of the FCPA.

Compliance with these anti-bribery laws is expensive and difficult, particularly in countries in which corruption is a recognized problem. In addition, the anti-bribery laws present particular challenges in the pharmaceutical industry because in many countries including China, hospitals are state-owned or operated by the government, and doctors and other hospital employees are considered foreign government officials. Furthermore, in certain countries (China in particular), hospitals and clinics are permitted to sell pharmaceuticals to their patients and are primary or significant distributors of pharmaceuticals. Certain payments to hospitals in connection with clinical studies, procurement of pharmaceuticals and other work have been deemed to be improper payments to government officials that have led to vigorous anti-bribery law enforcement actions and heavy fines in multiple jurisdictions, particularly in the U.S. and China.

It is not always possible to identify and deter violations, and the precautions we take to detect and prevent this activity may not be effective in controlling unknown or unmanaged risks or losses or in protecting us from governmental investigations or other actions or lawsuits stemming from a failure to be in compliance with such laws or regulations.

In the pharmaceutical industry, corrupt practices include, among others, acceptance of kickbacks, bribes or other illegal gains or benefits by the hospitals and medical practitioners from pharmaceutical manufacturers, distributors or their third party agents in connection with the prescription of certain pharmaceuticals. If our employees, affiliates, distributors or third party marketing firms violate these laws or otherwise engage in illegal practices with respect to their sales or marketing of our products or other activities involving our products, we could be required to pay damages or heavy fines by multiple jurisdictions where we operate, which could materially and adversely affect our financial condition and results of operations. The Chinese government has also sponsored anti-corruption campaigns from time to time, which could have a chilling effect on any future marketing efforts by us to new hospital customers. There have been recent occurrences in which certain hospitals have denied access to sales representatives from pharmaceutical companies because the hospitals wanted to avoid the perception of corruption. If this attitude becomes widespread among our potential customers, our ability to promote our products to hospitals may be adversely affected.

As we expand our operations in China and other jurisdictions internationally, we will need to increase the scope of our compliance programs to address the risks relating to the potential for violations of the FCPA and other anti-bribery and anti-corruption laws. Our compliance programs will need to include policies addressing not only the FCPA, but also the provisions of a variety of anti-bribery and anti-corruption laws in multiple foreign jurisdictions, including China, provisions relating to books and records that apply to us as a public company, and include effective training for our personnel throughout our organization. The creation and implementation of anti-corruption compliance programs is costly and such programs are difficult to enforce, particularly where reliance on third parties is required. Violation of the FCPA and other anti-corruption laws can result in significant administrative and criminal penalties for us and our employees, including substantial fines, suspension or debarment from government contracting, prison sentences, or even the death penalty in extremely serious cases in certain countries. The SEC also may suspend or bar us from trading securities on U.S. exchanges for violation of the FCPA's accounting provisions. Even if we are not ultimately punished by government authorities, the costs of investigation and review, distraction of our personnel, legal defense costs, and harm to our reputation could be substantial and could limit our profitability or our ability to develop or commercialize our product candidates. In addition, if any of our competitors are not subject to the FCPA, they may engage in practices that will lead to their receipt of preferential treatment from foreign hospitals and enable them to secure business from foreign hospitals in ways that are unavailable to us.

Uncertainties with respect to the China legal system could have a material adverse effect on us.

The legal system of China is a civil law system primarily based on written statutes. Unlike in a common law system, prior court decisions may be cited for reference but are not binding. Because the China legal system continues to rapidly evolve, the interpretations of many laws, regulations and rules are not always uniform and enforcement of these laws, regulations and rules involve uncertainties, which may limit legal protections available to us. Moreover, decision makers in the China judicial system have significant discretion in interpreting and implementing statutory and contractual terms, which may render it difficult for FibroGen Beijing to enforce the contracts it has entered into with our business partners, customers and suppliers. Different government departments may have different interpretations of certain laws and regulations, and licenses and permits issued or granted by one government authority may be revoked by a higher government authority at a later time. Navigating the uncertainty and change in the China legal system will require the devotion of significant resources and time, and there can be no assurance that our contractual and other rights will ultimately be enforced.

Changes in China's economic, political or social conditions or government policies could have a material adverse effect on our business and operations.*

Chinese society and the Chinese economy continue to undergo significant change. Changes in the political structure, regulations, and economic policies of the Chinese government could have a material adverse effect on the overall economic growth of China, which could adversely affect our ability to conduct business in China. The Chinese government continues to adjust economic policies to promote economic growth. Some of these measures benefit the overall Chinese economy, but may also have a negative effect on us. For example, our financial condition and results of operations in China may be adversely affected by government control over capital investments or changes in tax regulations. As the Chinese pharmaceutical industry grows and evolves, the Chinese government may also implement measures to change the regulatory structure and structure of foreign investment in this industry. We are unable to predict the frequency and scope of such policy changes and structural changes, any of which could materially and adversely affect FibroGen Beijing's development and commercialization timelines, liquidity, access to capital, and its ability to conduct business in China. Any failure on our part to comply with changing government regulations and policies could result in the loss of our ability to develop and commercialize our product candidates in China. In addition, the changing government regulations and policies could result in delays and cost increases to our development, manufacturing, approval, and commercialization timelines in China.

Our operations in China subject us to various Chinese labor and social insurance laws, and our failure to comply with such laws may materially and adversely affect our business, financial condition and results of operations.

We are subject to China Labor Contract Law, which provides strong protections for employees and imposes many obligations on employers. The Labor Contract Law places certain restrictions on the circumstances under which employers may terminate labor contracts and require economic compensation to employees upon termination of employment, among other things. In addition, companies operating in China are generally required to contribute to labor union funds and the mandatory social insurance and housing funds. Any failure by us to comply with Chinese labor and social insurance laws may subject us to late fees, fines and penalties, or cause the suspension or termination of our ability to conduct business in China, any of which could have a material and adverse effect on business, results of operations and prospects.

Recent developments relating to the United Kingdom's referendum vote in favor of leaving the EU could adversely affect us.

The United Kingdom held a referendum on June 23, 2016 in which a majority voted for the United Kingdom's withdrawal from the EU, commonly referred to as "Brexit". As a result of this vote, negotiations are expected to commence to determine the terms of the United Kingdom's withdrawal from the EU as well as its relationship with the EU going forward, including the terms of trade between the United Kingdom and the EU. The effects of the United Kingdom's withdrawal from the EU, and the perceptions as to its impact, are expected to be far-reaching and may adversely affect business activity and economic conditions in Europe and globally and could continue to contribute to instability in global financial markets, including foreign exchange markets. The United Kingdom's withdrawal from the EU could also have the effect of disrupting the free movement of goods, services and people between the United Kingdom and the EU and could also lead to legal uncertainty and potentially divergent national laws and regulations as the United Kingdom determines which EU laws to replace or replicate, including laws that could impact our ability, or our collaborator's ability in the case of roxadustat, to obtain approval of our products or sell our products in the United Kingdom. However, the full effects of such withdrawal are uncertain and will depend on any agreements the United Kingdom may make to retain access to EU markets. Lastly, as a result of the United Kingdom's withdrawal from the EU, other European countries may seek to conduct referenda with respect to their continuing membership with the EU. Given these possibilities and others we may not anticipate, as well as the lack of comparable precedent, the full extent to which our business, results of operations and financial condition could be adversely affected by the United Kingdom's withdrawal from the EU is uncertain.

Risks Related to the Operation of Our Business

We may encounter difficulties in managing our growth and expanding our operations successfully.

As we seek to advance our product candidates through clinical trials and commercialization, we will need to expand our development, regulatory, manufacturing, commercialization and administration capabilities or contract with third parties to provide these capabilities for us. As our operations expand and we continue to undertake the efforts and expense to operate as a public reporting company, we expect that we will need to increase the responsibilities on members of management in order to manage any future growth effectively. Our failure to accomplish any of these steps could prevent us from successfully implementing our strategy and maintaining the confidence of investors in our company.

If we fail to attract and keep senior management and key personnel, in particular our chief executive officer, we may be unable to successfully develop our product candidates, conduct our clinical trials and commercialize our product candidates.

We are highly dependent on our chief executive officer, Thomas B. Neff, and other members of our senior management team. The loss of the services of Mr. Neff or any of these other individuals would be expected to significantly negatively impact the development and commercialization of our product candidates, our existing collaborative relationships and our ability to successfully implement our business strategy.

Recruiting and retaining qualified commercial, development, scientific, clinical, and manufacturing personnel are and will continue to be critical to our success, particularly as we expand our commercialization operations. Furthermore, replacing executive officers and key employees may be difficult and may take an extended period of time because of the limited number of individuals in our industry with the breadth of skills and experience required to successfully develop, gain regulatory approval of and commercialize product candidates. We may be unable to hire, train, retain or motivate these key personnel on acceptable terms given the intense competition among numerous biopharmaceutical companies for similar personnel.

There is also significant competition, in particular in the San Francisco Bay Area, for the hiring of experienced and qualified personnel, which increases the importance of retention of our existing personnel. If we are unable to continue to attract and retain personnel with

the quality and experience applicable to our product candidates, our ability to pursue our strategy will be limited and our business and operations would be adversely affected.

If product liability lawsuits are brought against us, we may incur substantial liabilities and may be required to limit commercialization of our product candidates.

We face an inherent risk of product liability as a result of the clinical testing, manufacturing and commercialization of our product candidates. Any such product liability claims may include allegations of defects in manufacturing, defects in design, a failure to warn of dangers inherent in a product, negligence, strict liability or breach of warranty. Claims could also be asserted under state consumer protection acts. If we are unable to obtain insurance coverage at levels that are appropriate to maintain our business and operations, or if we are unable to successfully defend ourselves against product liability claims, we may incur substantial liabilities or otherwise cease operations. Product liability claims may result in:

- termination of further development of unapproved product candidates or significantly reduced demand for any approved products;
- material costs and expenses to defend the related litigation;
- a diversion of time and resources across the entire organization, including our executive management;
- product recalls, withdrawals or labeling restrictions;
- termination of our collaboration relationships or disputes with our collaboration partners; and
- reputational damage negatively impacting our other product candidates in development.

If we fail to obtain and retain sufficient product liability insurance at an acceptable cost to protect against potential product liability claims, we may not be able to continue to develop our product candidates. We maintain product liability insurance in a customary amount for the stage of development of our product candidates. Although we believe that we have sufficient coverage based on the advice of our third party advisors, there can be no assurance that such levels will be sufficient for our needs. Moreover, our insurance policies have various exclusions, and we may be in a dispute with our carrier as to the extent and nature of our coverage, including whether we are covered under the applicable product liability policy. If we are not able to ensure coverage or are required to pay substantial amounts to settle or otherwise contest the claims for product liability, our business and operations would be negatively affected.

Our business and operations would suffer in the event of computer system failures.

Despite the implementation of security measures, our internal computer systems, and those of our CROs, collaboration partners, and other third parties on which we rely, are vulnerable to damage from computer viruses, unauthorized access, natural disasters, fire, terrorism, war and telecommunication and electrical failures. We upgraded our disaster and data recovery capabilities in June 2017, however, to the extent that any disruption or security breach, in particular with our partners' operations, results in a loss of, or damage to, our data or applications, or inappropriate disclosure of confidential or proprietary information, we could incur liability and it could result in a material disruption and delay of our drug development programs. For example, the loss of clinical trial data from completed, ongoing or planned clinical trials could result in delays in our regulatory approval efforts and significantly increase our costs to recover or reproduce the data.

We depend on sophisticated information technology systems to operate our business and a cyber-attack or other breach of these systems could have a material adverse effect on our business.

We rely on information technology systems to process, transmit and store electronic information in our day-to-day operations. The size and complexity of our information technology systems makes them vulnerable to a cyber-attack, malicious intrusion, breakdown, destruction, loss of data privacy or other significant disruption. While we have recently upgraded our disaster data recovery program, a successful attack could result in the theft or destruction of intellectual property, data, or other misappropriation of assets, or otherwise compromise our confidential or proprietary information and disrupt our operations. Cyber-attacks are becoming more sophisticated and frequent. We have invested in our systems and the protection and recoverability of our data to reduce the risk of an intrusion or interruption, and we monitor and test our systems on an ongoing basis for any current or potential threats. There can be no assurance that these measures and efforts will prevent future interruptions or breakdowns. If we fail to maintain or protect our information technology systems and data integrity effectively or fail to anticipate, plan for or manage significant disruptions to these systems, we could have difficulty preventing, detecting and controlling such cyber-attacks and any such attacks could result in losses described above as well as disputes with physicians, patients and our partners, regulatory sanctions or penalties, increases in operating expenses, expenses or lost revenues or other adverse consequences, any of which could have a material adverse effect on our business, results of operations, financial condition, prospects and cash flows.

Our headquarters and data storage facilities are located near known earthquake fault zones. The occurrence of an earthquake, fire or any other catastrophic event could disrupt our operations or the operations of third parties who provide vital support functions to us, which could have a material adverse effect on our business, results of operations and financial condition.

We and some of the third party service providers on which we depend for various support functions, such as data storage, are vulnerable to damage from catastrophic events, such as power loss, natural disasters, terrorism and similar unforeseen events beyond our control. Our corporate headquarters and other facilities are located in the San Francisco Bay Area, which in the past has experienced severe earthquakes and fires.

We do not carry earthquake insurance. Earthquakes or other natural disasters could severely disrupt our operations, and have a material adverse effect on our business, results of operations, financial condition and prospects.

If a natural disaster, power outage or other event occurred that prevented us from using all or a significant portion of our headquarters, damaged critical infrastructure, or otherwise disrupted operations, it may be difficult or, in certain cases, impossible for us to continue our business for a substantial period of time. The disaster recovery and business continuity plans we have in place are unlikely to provide adequate protection in the event of a serious disaster or similar event. We may incur substantial expenses as a result of the limited nature of our disaster recovery and business continuity plans, which, particularly when taken together with our lack of earthquake insurance, could have a material adverse effect on our business.

Furthermore, integral parties in our supply chain are operating from single sites, increasing their vulnerability to natural disasters or other sudden, unforeseen and severe adverse events. If such an event were to affect our supply chain, it could have a material adverse effect on our business.

Risks Related to Our Common Stock

The market price of our common stock may be highly volatile, and you may not be able to resell your shares at or above your purchase price.

In general, pharmaceutical, biotechnology and other life sciences company stocks have been highly volatile in the current market. The volatility of pharmaceutical, biotechnology and other life sciences company stocks is sometimes unrelated to the operating performance of particular companies and biotechnology and life science companies stocks often respond to trends and perceptions rather than financial performance. In particular, the market price of shares of our common stock could be subject to wide fluctuations in response to the following factors:

- results of clinical trials of our product candidates, including roxadustat and pamrevlumab;
- the timing of the release of results of and regulatory updates regarding our clinical trials;
- the level of expenses related to any of our product candidates or clinical development programs;
- results of clinical trials of our competitors' products;
- safety issues with respect to our product candidates or our competitors' products;
- regulatory actions with respect to our product candidates and any approved products or our competitors' products;
- fluctuations in our financial condition and operating results, which will be significantly affected by the manner in which we recognize revenue from the achievement of milestones under our collaboration agreements;
- adverse developments concerning our collaborations and our manufacturers;
- the termination of a collaboration or the inability to establish additional collaborations;
- the publication of research reports by securities analysts about us or our competitors or our industry or negative recommendations or withdrawal of research coverage by securities analysts;
- the inability to obtain adequate product supply for any approved drug product or inability to do so at acceptable prices;
- disputes or other developments relating to proprietary rights, including patents, litigation matters and our ability to obtain patent protection for our technologies;
- the ineffectiveness of our internal controls;
- our failure or the failure of our competitors to meet analysts' projections or guidance that we or our competitors may give to the market:

73

11/4/21, 2:41 PM Case 3:21-cv-02623-EMC Document **ball**10**-Eibe cb 3:1/hlr4/22** Page 11 of 1730 Table of Contents

- additions and departures of key personnel;
- announced strategic decisions by us or our competitors;
- changes in legislation or other regulatory developments affecting our product candidates or our industry;
- fluctuations in the valuation of the biotechnology industry and particular companies perceived by investors to be comparable to us;
- sales of our common stock by us, our insiders or our other stockholders;
- speculation in the press or investment community;
- announcement or expectation of additional financing efforts;
- announcements of investigations or regulatory scrutiny of our operations or lawsuits filed against us;
- changes in accounting principles;
- activities of the government of China, including those related to the pharmaceutical industry as well as industrial policy generally;
- performance of other U.S. publicly traded companies with significant operations in China;
- terrorist acts, acts of war or periods of widespread civil unrest;
- natural disasters such as earthquakes and other calamities;
- changes in market conditions for biopharmaceutical stocks;
- changes in general market and economic conditions; and
- the other factors described in this "Risk Factors" section.

As a result of fluctuations caused by these and other factors, comparisons of our operating results across different periods may not be accurate indicators of our future performance. Any fluctuations that we report in the future may differ from the expectations of market analysts and investors, which could cause the price of our common stock to fluctuate significantly. Moreover, securities class action litigation has often been initiated against companies following periods of volatility in their stock price. This type of litigation could result in substantial costs and divert our management's attention and resources, and could also require us to make substantial payments to satisfy judgments or to settle litigation.

We have broad discretion in the use of the net proceeds from our underwritten public offerings of common stock completed on April 11, 2017 (the "April 2017 Offering") and August 24, 2017 (the "August 2017 Offering") and may not use them effectively.

The net proceeds from the April 2017 Offering is intended to be used to fund the expansion of product development in China, including developing roxadustat in additional indications beyond CKD, manufacturing and commercialization activities, as well as for general corporate purposes. The net proceeds from the August 2017 Offering is intended to be used to fund the expansion of product development, including our development of pamrevlumab beyond current Phase 2 programs, manufacturing and commercialization activities, as well as for general corporate purposes. These general corporate purposes, may include, among other things, funding research and development, clinical trials, vendor payables, potential regulatory submissions, hiring additional personnel and capital expenditures. However, we have no current commitments or obligations to use the net proceeds in the manner described above. Our management has broad discretion in the application of the balance of the net proceeds from the April 2017 Offering and the August 2017 Offering, and could spend the proceeds in ways our stockholders may not agree with or that fails to improve our business or enhance the value of our common stock. The failure by our management to use these funds effectively could result in financial losses that could harm our business, cause the price of our common stock to decline and delay the development of our product candidates.

If securities or industry analysts do not continue to publish research or reports about our business, or if they change their recommendations regarding our stock adversely, our stock price and trading volume could decline.

The trading market for our common stock will be influenced by the research and reports that industry or securities analysts publish about us or our business. If one or more of the analysts who cover us downgrade our stock, our stock price would likely decline. If one or more of these analysts cease coverage of our company or fail to regularly publish reports on us, we could lose visibility in the financial markets, which in turn could cause our stock price or trading volume to decline.

Our principal stockholders and management own a significant percentage of our stock and will be able to exercise significant influence over matters subject to stockholder approval.*

As of April 30, 2019, our executive officers, directors and principal stockholders, together with their respective affiliates, owned approximately 39.40% of our common stock, including shares subject to outstanding options that are exercisable within 60 days after such date and shares issuable upon settlement of restricted stock units that will vest within 60 days after such date. This percentage is based upon information supplied by officers, directors and principal stockholders and Schedules 13D and 13G, if any, filed with the SEC, which information may not be accurate as of April 30, 2019. Accordingly, these stockholders will be able to exert a significant degree of influence over our management and affairs and over matters requiring stockholder approval, including the election of our board of directors and approval of significant corporate transactions. The interests of this group may differ from those of other stockholders and they may vote their shares in a way that is contrary to the way other stockholders vote their shares. This concentration of ownership could have the effect of entrenching our management and/or the board of directors, delaying or preventing a change in our control or otherwise discouraging a potential acquirer from attempting to obtain control of us, which in turn could have a material and adverse effect on the fair market value of our common stock.

Additional remedial measures that may be imposed in the proceedings instituted by the SEC against five China based accounting firms, including the Chinese affiliate of our independent registered public accounting firm, could result in our consolidated financial statements being determined to not be in compliance with the requirements of the Exchange Act.

In late 2012, the SEC commenced administrative proceedings under Rule 102(e) of its Rules of Practice and also under the Sarbanes-Oxley Act of 2002 against the Chinese affiliates of the "big four" accounting firms, including PricewaterhouseCoopers Zhong Tian CPAs Limited, the Chinese affiliate of our independent registered public accounting firm. The Rule 102(e) proceedings initiated by the SEC relate to these firms' failure to produce documents, including audit work papers, in response to the request of the SEC pursuant to Section 106 of the Sarbanes-Oxley Act of 2002, as the auditors located in China are not in a position lawfully to produce documents directly to the SEC because of restrictions under Chinese law and specific directives issued by the China Securities Regulatory Commission ("CSRC"). The issues raised by the proceedings are not specific to our auditors or to us.

In January 2014, an administrative law judge reached an initial decision that the Chinese affiliates of the "big four" accounting firms should be barred from practicing before the SEC for a period of six months. In February 2015, the Chinese affiliates of the "big four" accounting firms each agreed to a censure and to pay a fine to the SEC to settle the dispute and avoid suspension of their ability to practice before the SEC and audit U.S.-listed companies. The settlement required the firms to follow detailed procedures and to seek to provide the SEC with access to Chinese firms' audit documents via the CSRC. If future document productions fail to meet specified criteria, the SEC retains authority to impose a variety of additional remedial measures on the firms depending on the nature of the failure.

We cannot predict if the SEC will further review the four firms' compliance with specified criteria or if such further review would result in the SEC imposing additional penalties such as suspensions or commencing any further administrative proceedings. Although it does not play a substantial role (as defined under PCAOB standards) in the audit of our consolidated financial statements, if PricewaterhouseCoopers Zhong Tian CPAs Limited were denied, temporarily, the ability to practice before the SEC, our ability to produce audited consolidated financial statements for our company could be affected and we could be determined not to be in compliance with the requirements of the Exchange Act. Such a determination could ultimately lead to the delisting of our shares from the Nasdaq Global Select Market or deregistration from the SEC, or both, which would substantially reduce or effectively terminate the trading of our stock.

We may engage in future acquisitions that could disrupt our business, cause dilution to our stockholders and harm our business, results of operations, financial condition and cash flows and future prospects.

While we currently have no specific plans to acquire any other businesses, we may, in the future, make acquisitions of, or investments in, companies that we believe have products or capabilities that are a strategic or commercial fit with our present or future product candidates and business or otherwise offer opportunities for our company. In connection with these acquisitions or investments, we may:

- issue stock that would dilute our existing stockholders' percentage of ownership;
- incur debt and assume liabilities; and
- incur amortization expenses related to intangible assets or incur large and immediate write-offs.

11/4/21, 2:41 PM Case 3:21-cv-02623-EMC Document fall 100 File ob \$31/hlm4/22 Page 13 of 1730 Table of Contents

We may not be able to complete acquisitions on favorable terms, if at all. If we do complete an acquisition, we cannot assure you that it will ultimately strengthen our competitive position or that it will be viewed positively by customers, financial markets or investors. Furthermore, future acquisitions could pose numerous additional risks to our operations, including:

- problems integrating the purchased business, products or technologies, or employees or other assets of the acquisition target;
- · increases to our expenses;
- disclosed or undisclosed liabilities of the acquired asset or company;
- diversion of management's attention from their day-to-day responsibilities;
- reprioritization of our development programs and even cessation of development and commercialization of our current product candidates;
- harm to our operating results or financial condition;
- entrance into markets in which we have limited or no prior experience; and
- potential loss of key employees, particularly those of the acquired entity.

We may not be able to complete any acquisitions or effectively integrate the operations, products or personnel gained through any such acquisition.

Provisions in our charter documents and Delaware law may have anti-takeover effects that could discourage an acquisition of us by others, even if an acquisition would be beneficial to our stockholders, and may prevent attempts by our stockholders to replace or remove our current directors or management.

Provisions in our amended and restated certificate of incorporation and amended and restated bylaws contain provisions that may have the effect of discouraging, delaying or preventing a change in control of us or changes in our management. These provisions could also limit the price that investors might be willing to pay in the future for shares of our common stock, thereby depressing the market price of our common stock. In addition, because our board of directors is responsible for appointing the members of our management team, these provisions may frustrate or prevent any attempts by our stockholders to replace or remove our current management by making it more difficult for stockholders to replace members of our board of directors. Among other things, these provisions:

- authorize "blank check" preferred stock, which could be issued by our board of directors without stockholder approval and may contain voting, liquidation, dividend and other rights superior to our common stock;
- create a classified board of directors whose members serve staggered three-year terms;
- specify that special meetings of our stockholders can be called only by our board of directors pursuant to a resolution adopted by a majority of the total number of directors;
- prohibit stockholder action by written consent;
- establish an advance notice procedure for stockholder approvals to be brought before an annual meeting of our stockholders, including proposed nominations of persons for election to our board of directors;
- provide that our directors may be removed prior to the end of their term only for cause;
- provide that vacancies on our board of directors may be filled only by a majority of directors then in office, even though less than a quorum;
- require a supermajority vote of the holders of our common stock or the majority vote of our board of directors to amend our bylaws; and
- require a supermajority vote of the holders of our common stock to amend the classification of our board of directors into three classes and to amend certain other provisions of our certificate of incorporation.

These provisions, alone or together, could delay or prevent hostile takeovers and changes in control or changes in our management by making it more difficult for stockholders to replace members of our board of directors, which is responsible for appointing the members of our management.

Moreover, because we are incorporated in Delaware, we are governed by certain anti-takeover provisions under Delaware law which may discourage, delay or prevent someone from acquiring us or merging with us whether or not it is desired by or beneficial to our stockholders. We are subject to the provisions of Section 203 of the Delaware General Corporation Law, which prohibits a person who owns in excess of 15% of our outstanding voting stock from merging or combining with us for a period of three years after the date of the transaction in which the person acquired in excess of 15% of our outstanding voting stock, unless the merger or combination is approved in a prescribed manner.

Any provision of our amended and restated certificate of incorporation, our amended and restated bylaws or Delaware law that has the effect of delaying or deterring a change in control could limit the opportunity for our stockholders to receive a premium for their shares of our common stock, and could also affect the price that some investors are willing to pay for our common stock.

Changes in our tax provision or exposure to additional tax liabilities could adversely affect our earnings and financial condition.

As a multinational corporation, we are subject to income taxes in the U.S. and various foreign jurisdictions. Significant judgment is required in determining our global provision for income taxes and other tax liabilities. In the ordinary course of a global business, there are intercompany transactions and calculations where the ultimate tax determination is uncertain. Our income tax returns are subject to audits by tax authorities. Although we regularly assess the likelihood of adverse outcomes resulting from these examinations to determine our tax estimates, a final determination of tax audits or tax disputes could have an adverse effect on our results of operations and financial condition.

We are also subject to non-income taxes, such as payroll, sales, use, value-added, net worth, property, gross receipts, and goods and services taxes in the U.S., state and local, and various foreign jurisdictions. We are subject to audit and assessments by tax authorities with respect to these non-income taxes and may have exposure to additional non-income tax liabilities, which could have an adverse effect on our results of operations and financial condition.

On December 22, 2017, the U.S. enacted the Tax Act that instituted fundamental changes to the taxation of multinational corporations. The Tax Act includes changes to the taxation of foreign earnings by implementing a dividend exemption system, expansion of the current anti-deferral rules, a minimum tax on low-taxed foreign earnings and new measures to deter base erosion. The Tax Act also includes a permanent reduction in the corporate tax rate to 21%, repeal of the corporate alternative minimum tax, expensing of capital investment, and limitation of the deduction for interest expense. Furthermore, as part of the transition to the new tax system, a one-time transition tax is imposed on a U.S. shareholder's historical undistributed earnings of foreign affiliates. Although the Tax Act is generally effective January 1, 2018, GAAP requires recognition of the tax effects of new legislation during the reporting period that includes the enactment date, which was December 22, 2017.

As a result of the impact of the Tax Act, the SEC provided guidance that allows us to record provisional amounts for those affected items, with the requirement that the accounting be completed in a period not to exceed one year from the date of enactment. As of December 31, 2018, we completed our analysis of the accounting for the tax effects of the Tax Act and no material adjustments were recognized at year end. The primary impact of the Tax Act relates to the re-measurement of deferred tax assets and liabilities resulting from the Corporate Tax Rate Change, which was recorded as of December 31, 2017. Developing interpretations of the provisions of the Tax Act, changes to U.S. Treasury regulations, administrative interpretations or court decisions interpreting the Tax Act in the future periods may require further adjustments to our analysis.

Our amended and restated certificate of incorporation designates the state or federal courts located in the State of Delaware as the sole and exclusive forum for certain types of actions and proceedings that may be initiated by our stockholders, which could limit our stockholders' ability to obtain a favorable judicial forum for disputes with us or our directors, officers or employees.

Our amended and restated certificate of incorporation provides that, subject to limited exceptions, the state and federal courts located in the State of Delaware will be the sole and exclusive forum for (1) any derivative action or proceeding brought on our behalf, (2) any action asserting a claim of breach of a fiduciary duty owed by any of our directors, officers or other employees to us or our stockholders, (3) any action asserting a claim against us arising pursuant to any provision of the Delaware General Corporation Law, our amended and restated certificate of incorporation or our amended and restated by-laws, or (4) any other action asserting a claim against us that is governed by the internal affairs doctrine. Any person or entity purchasing or otherwise acquiring any interest in shares of our capital stock shall be deemed to have notice of and to have consented to the provisions of our amended and restated certificate of incorporation described above. This choice of forum provision may limit a stockholder's ability to bring a claim in a judicial forum that it finds favorable for disputes with us or our directors, officers or other employees, which may discourage such lawsuits against us and our directors, officers and employees. Alternatively, if a court were to find these provisions of our amended and restated certificate of incorporation inapplicable to, or unenforceable in respect of, one or more of the specified types of actions or proceedings, we may

incur additional costs associated with resolving such matters in other jurisdictions, which could adversely affect our business and financial condition.

Because we do not anticipate paying any cash dividends on our capital stock in the foreseeable future, capital appreciation, if any, will be your sole source of gain and you may never receive a return on your investment.

You should not rely on an investment in our common stock to provide dividend income. We do not anticipate that we will pay any cash dividends to holders of our common stock in the foreseeable future and investors seeking cash dividends should not purchase our common stock. We plan to retain any earnings to invest in our product candidates and maintain and expand our operations. Therefore, capital appreciation, or an increase in your stock price, which may never occur, may be the only way to realize any return on your investment.

ITEM 2. UNREGISTERED SALES OF EQUITY SECURITIES AND USE OF PROCEEDS.

Use of Proceeds from Initial Public Offering of Common Stock

On November 13, 2014, our Registration Statement on Form S-1, as amended (Reg. Nos. 333-199069 and 333-200189) was declared effective in connection with the initial public offering of our common stock. There has been no material change in the planned use of proceeds from our initial public offering as described in our final prospectus filed with the SEC pursuant to Rule 424(b) under the Securities Act on November 14, 2014.

ITEM 3. DEFAULTS UPON SENIOR SECURITIES.

Presentation

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Okay, we'll continue with the next session. Good morning, everyone. I'm Paul Choi, the U.S. mid-cap biotechnology analyst here at Goldman Sachs. And in the audience here, from the team, we have Corinne Jenkins. Our next session will be with FibroGen. And to my left, from the management team, we have Dr. Tom Neff, CEO, who will introduce the rest of the team here for you to the audience.

Thomas B. Neff

Founder, Chairman & CEO

Yes. Thank you, Paul. Dr. Peony Yu is on my immediate left, our Chief Medical Officer; and at the end, Dr. Elias Kouchakji, who is both Global Safety Head for the anemia program, roxadustat, and also the Head of Clinical Development for the pamrevlumab program. So that's the team for this morning.

Question and Answer

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Great. Thank you for that. So perhaps we'll kick off the Q&A and -- with perhaps an overview of the data and the top line results you and your collaborators recently presented. So either Tom or Peony to walk us -- perhaps can walk us through the data, understand what were the results in the respective populations and how to think perhaps, starting with that, just what were the results on top line and what we can expect in terms of a little more details as we proceed in the future.

Thomas B. Neff

Founder, Chairman & CEO

So Peony, please go ahead on this.

K. Peony Yu

Chief Medical Officer

Okay. Yes. So we've recently reported exciting positive full adjudicated cardiovascular safety results from the largest Phase III CKD anemia program. We believe we have compelling evidence confirming roxadustat's cardiovascular safety to support our regulatory filings. In Europe, the primary cardiovascular safety endpoint is MACE+, and in U.S., it is MACE. In dialysis, we compare roxa to EPO, and in nondialysis, the comparison is to placebo, which is the gold standard for safety comparison. We believe our MACE+ results have met the European criteria for cardiovascular safety in dialysis and in nondialysis. For U.S., we believe our MACE results in dialysis and in nondialysis also supports the conclusion of no increased cardiovascular safety risk.

To further frame the safety result, along with efficacy together, in dialysis, I also want to emphasize MACE + superiority in incident dialysis pool of over 1,500 patients. Lower MACE+ risk than EPO in incident dialysis may allow roxadustat to become first-line therapy for patients starting dialysis and continuing long-term anemia treatment. Superiority in transfusion avoiding EPO hyporesponsiveness are important benefits too in this population. For nondialysis, we believe safety noninferiority against placebo in MACE and MACE+ coupled with efficacy benefits like transfusion reduction, attenuation of renal progression, measuring eGFR change and improvement in quality of life when treating patients with roxa may give us the opportunity to improve and expand anemia care in the very large CKD nondialysis patient population.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Great. You've mentioned 2 different things with regard to the European side and the U.S. side. And maybe just starting with the European side, your -- it sounds like your level of comfort there and your partners is fairly high with respect to meeting the MACE criteria in both populations. And I just want to maybe clarify that with regard to the regulatory outlook in Europe. Is that what you and your collaborators are articulating with meeting the criteria in both populations?

K. Peony Yu

Chief Medical Officer

Yes. So we have -- this data has been shared with our partner Astellas, and jointly, we are very well prepared to submit MAA.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

And with respect to timing on the MAA, could you maybe just remind us or update us what you're thinking that you and your partners will have in terms of announcement with that timing, when we would potentially expect things like updates on the filings and so forth?

K. Peony Yu

Chief Medical Officer

Yes. So we are preparing common technical document that can be -- CDT, and that can be used for U.S. and Europe with slight modification. And so the target submission time line for MAA is around November just right after U.S. target time line, September-October time frame.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Okay. Great. And then on the U.S. side, you also talked about your level of comfort there. And understanding, would the timing there be similar with regard to filing out potential applications here in the U.S.? And how are you thinking about those mechanics?

K. Peony Yu

Chief Medical Officer

Okay. So for the U.S., so our team has been conducting data analysis and preparing the documents needed for NDA. We have a pre-NDA meeting with the FDA at the end of July to discuss the full content of the NDA as well as details of some of the analysis, especially in nondialysis. And so we -- so this is part of the overall time line for our targeted submissions in the September-October time frame.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Great. With respect to getting a little more details on the top line results, can you maybe help us understand what would perhaps be a appropriate medical conference or forum where you might present the full data? And you and your colleagues -- or collaborators, excuse me, have you reached an agreement on when you would present the data and what exactly you would present?

K. Peony Yu

Chief Medical Officer

Yes. Well, you know that our top priority are the NDA and MAA submission. And in terms of medical conferences, we are planning to present Phase III results, this is in collaboration with our partners, and do this in nephrology conference and the first one that comes to mind is the ASN in November of this year. We are also making preparations of a full data disclosure manuscript, a high priority amongst our joint team in the 3 companies.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Okay. So the American Society of Nephrology would potentially be the most logical forum for full details on -- would this be across all populations or just the...

Thomas B. Neff

Founder, Chairman & CEO

I think the manuscripts will be ultimately full details because there's just so much data to get to. These are huge studies. At ASN, we'll do our best to cover certain topics, but I think that we're expecting the manuscripts will be needed to get to everything.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Got you for that. Okay. You mentioned your timing expectations in terms of your pre-NDA would be roughly in the July time frame. Would you have, do you think, any subsequent discussions in the back half of this year prior to your NDA filing? And would that be something from a timing perspective that you would update investors on? Or how do you think about that, Tom?

Thomas B. Neff

Founder, Chairman & CEO

We're considering the possibility of that, yes. Depends on the timing. But if the timing goes according to plan, now we're looking at end of August time period to do something.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

And would that be with respect to both populations? Or would you -- do you think this would have to be bracketed out into 2 populations [indiscernible]?

Thomas B. Neff

Founder, Chairman & CEO

We'd like to be able to show a different angle of refraction on the data, so give a different cut of it, so investors can appreciate a little more some of the issues that they've been debating.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Great. Perhaps after you think about the submissions on the U.S. and European side, is there any thoughts on the potential for an adcom here? I guess that's a question that investors may have. And maybe how do you think about that possibility? What are your levels of preparation, I guess, in case that is an occurrence or an event that occurs, how do you think about that?

Thomas B. Neff

Founder, Chairman & CEO

Given the history in dialysis, some of the sorted history in dialysis, we expect there will be an adcom, and so we're planning accordingly. And we have very, very good data, so I think it would be really interesting to see how that goes.

K. Peony Yu

Chief Medical Officer

Plus, we have very strong support from KOLs in the nephrology field, and we have been working with these experts for a number of years. So we think that if adcom does come up, we will be well prepared. But at the same time, decision on adcom is based on FDA's decision after they review the complete NDA file.

Thomas B. Neff

Founder, Chairman & CEO

But it is the baseline planning assumption that there will be an adcom.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

The baseline case for you...

Thomas B. Neff

Founder, Chairman & CEO

That's right.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

And your collaborators will be for an adcom here?

Thomas B. Neff

Founder, Chairman & CEO

Yes.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Great. With that in mind, perhaps thinking about commercialization here and thinking about what the market development might look like, can you talk about your level of preparation and how you're thinking about commercialization? And maybe starting there and then we can dive into that a little deeper.

Thomas B. Neff

Founder, Chairman & CEO

Okay. So AstraZeneca is our collaborator in the U.S. and Astellas in Europe. These have been long-term relationships. I think that the recent datasets, in particular, after the adjudication on blind revealed opportunities, frankly, neither side, Europe or the U.S., was expecting. And so for instance, with Astellas in Europe, the idea that MACE+ would be superior in efficacy and safety to EPO is a big change in opportunity set from their perspective. And they are working hard to reprioritize and redefine investment, investments getting larger. I think without question, this program is very important to each of these companies in terms of their highest priority new programs. Each of them will name first 1 or 2 in their whole company and that continues. So I think that we see that aspect, if anything, expanding investment, heightening the energy level and so on.

With AstraZeneca in the U.S., which is a company that's the largest renal sales company now, they have a lot of capability. They are preparing appropriately. We help them with medical affairs as it relates to the large dialysis organizations. We also help them with commercial market preparation in other areas such as the CMS negotiations for new technology like this. So there's a lot of areas of contact and interaction between our company and AZ. But we are looking to them to provide the muscle on the ground, so to speak, in the U.S. So things are moving along and, I'd say, an appropriate level of excitement and response based on the data.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

As we think about the landscape with regard to reimbursement in the dialysis and nondialysis setting, there's obviously been some evolution over time with regard to the EPO. There was certainly more -- call it, a decade-plus ago, more flexibility with regard to pricing, but then the model evolved, as you know, to more a bundled arrangement. How do you think about the payers, both on the private and public side, thinking about bundling that exists currently in the market? And where do you see roxa perhaps fitting in here? And perhaps is there -- how does the model accommodate your product?

Thomas B. Neff

Founder, Chairman & CEO

Yes. So I think we disclosed a few years ago that CMS had indicated that depending on the results, and I think the results are now in, that they were allowed to look at roxa as new technology and as such had the freedom of flexibility to strike a different arrangement with us if they so chose to do. What I can say now is that they have a project team that's been working on roxa for several years, and there's a point of interaction on several different issues. Been going on for a while. So we'll see what happens. But I think that it's a little bit hard to predict right now what it will turn out to be in the dialysis setting. I don't expect any strict bundle or any strict definition by just oral therapy. I think it's going to be something else. Outside of that, Part D medicines in pre-dialysis settings are pretty well understood. So I don't think that's going to be such a big issue.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Okay. Maybe on the market development side, with respect to the competitive landscape, there are various factors, such as biosimilars potentially launching in the U.S. on the EPO side at some point in the foreseeable future potentially. But in terms of other therapeutic modalities, are there anything -- is there

anything out there that keeps you awake at night in terms of a competitive perspective outside of the EPO or biosimilars that you see coming on here that are on your radar screen with respect to competitive pressures?

Thomas B. Neff

Founder, Chairman & CEO

Well, we're in a place now where we have safety data and efficacy data that's superior to EPO in a U.S. setting. So I think that situation and all the implications around it is being reevaluated a bit. I think we'll be watching with some interest whether any of the HIF companies can get enough momentum to sort of they'll -- fast follower-type companies. But as it relates to ESAs or PEG-ESAs, I'm not so sure we're thinking that's a major competitive risk at this point.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

So you think primarily of the HIF, whether it's 2 alphas or other things like that, being relatively early stage in terms of the competitive landscape and not differentiated...

Thomas B. Neff

Founder, Chairman & CEO

Well, speaking more broadly, in China, we -- for instance, we have a very large operation, and we don't see HIF competition in the next 3 to 5 years. In Japan, we do see competition because there are other companies lining up for launch, and that's probably a reflection of the different regulatory environments in each of those countries, what's possible. In the U.S., there are a couple of factors related to how we've differentiated ourself and I think in one respect doing the work to do placebo study in CKD and show that we are as safe as the placebo control arm is a very exciting place to be for purposes of trying to build a marketplace. That took a lot of effort over a long period of time. And I know that FDA has expressed in various ways that they're very pleased with the progress over the years and what's gone on.

And in the dialysis setting, we also set out a thesis, 2012, 2013, that an incident dialysis comparison would be favorable to the roxa technology over EPO. And so we've ended up creating a pool of almost 1,600 patients in a incident dialysis setting where from the time a patient might initiate dialysis any time in the next 4 months they randomize to either roxa or EPO, then we study them all the way through and we've had outstanding results in this area. We think it's the most fair comparison of EPO to roxa. We think it opens the door to roxa being recommended as a first medicine, both in the U.S. and in China. And so I think that we'll see how it develops. You can never be sure until you get there, but it looks very, very promising at this point.

And so I think when I look at the competitor HIF companies, they did not invest in these kinds of studies in -- on nondialysis, they're doing comparisons to ESA. That is really a market that has been deemphasized really at FDA's direction for a long period of time now.

And then in the dialysis setting, I think the largest incident population that we're aware of amongst the other companies doing HIF is about 350 patients, and that's not nearly big enough to deal with the powering of statistical results we're trying to get to. So we are very hopeful that we have a strong competitive position in the U.S., and we think probably in Europe, we're going to see very similar dynamics develop, although Europe is a much more complicated picture in terms of cross-licensing stuff than the U.S. So we'll just have to wait and see how it develops in Europe, I think.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Great. Maybe returning to the regulatory landscape for a moment. As investors do have access and awareness of what the product looks like in the China market currently, you have sort of a label that's a product approval that gives investors a way to assess what kind of claims and data and so forth are available overseas. But as you think about the U.S. side, if you were to think about what is perhaps a base case based on the data you've seen so far to think about your label, potential claims and what data

might be included, how would you perhaps frame a base case for us? And what would sort of be the most optimistic case in terms of what a U.S. FDA-approved label might look like, would you say?

Thomas B. Neff

Founder, Chairman & CEO

So Peony, I'm probably going to let you to try to answer this, but I'm going to start with one observation, and that is, in China, we've actually earned a label where the treatment range is 10.5 to 12 hemoglobin. And so in China, ESA is limited to 11. And so the regulators were very comfortable in giving that difference initially with roxa based on the data. We don't know if something like that is possible in the U.S., and we are not gunning for it as a primary goal. It's just -- it was inappropriate given the circumstances a few years ago to be thinking about it that way. But it is an issue that we're seeing develop in a favorable manner elsewhere. So with that, Peony, please go ahead on...

K. Peony Yu

Chief Medical Officer

Thank you, Tom. So Tom mentioned the target hemoglobin range in the China label. Another very important differentiation in the China label that sets roxa apart from ESA is the product warning precaution. And the EPO label in China has warning of death, MI, stroke and tumor. And those terms do not appear as warning on our roxa label in China. And that is because the Chinese regulators recognize roxadustat as a different class of drug from ESA and label according to what the data showed. Now we are -- we know that our FDA has a lot of excellent clinical scientists, and we are hopeful that given the data we generated and showing cardiovascular safety comparing to placebo and superiority in MACE+ against EPO, that our FDA will also label our drug according to what the data they would be reviewing.

Thomas B. Neff

Founder, Chairman & CEO

I think a key goal in the U.S. was -- with CKD population, a placebo study was to show noninferior to placebo, to show that there isn't any incremental risk of measure so that it opens the door to the logic it shouldn't have a black box for placebo. Therefore, roxa should not have black box and go from there in dealing with dialysis. And it's turned out as we hoped for. So I think this will be very interesting. Yes.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

With respect to the 2 different populations that will be reviewed, perhaps as you think about the market over time and thinking about what patient duration could look like as it evolves and you get more market information, can you maybe, first of all, remind us how long -- what is the longest or, on average, patients have been treated here across the various studies? And then how do you think about that perhaps evolving in a real-world setting as you commercialize in the U.S.?

K. Peony Yu

Chief Medical Officer

Yes. Paul, great question. Roxadustat exposed patient, the longest time is more than 6 years in our extension from our Phase II. And we have a small number of patients who just refused to get off this drug because they love it. And in our Phase III studies, we have substantial number of patients with over 2 years of exposure. And in fact, that's around the average amount of time on study. And what we have found is the drug is very durable. And what I mean by that is that the dose required to maintain that hemoglobin seems quite stable over time. And I think that one of the big reasons is that our drug mobilizes iron and is not affected by inflammation, which both of those are issues with EPO.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Great. In the time remaining, perhaps I want to switch a little bit -- switch gears here and maybe switch to the pamrevlumab program and think about that and maybe we can just start with regard to a quick

overview of the various development programs and where they are, maybe starting with that, to kick it off.

Thomas B. Neff

Founder, Chairman & CEO

Dr. Kouchakji is going to address these questions. Elias, please go ahead.

Elias Kouchakji

Senior Vice President of Clinical Development, Drug Safety & Pharmacovigilance

Thank you, Tom. Thank you, Paul. Recently, we are starting, as we said, 2 Phase III studies. The first one is IPF, idiopathic pulmonary fibrosis, and the second one is in pancreatic cancer, specifically locally advanced and resectable pancreatic cancer. These are 2 very important programs. I would like to emphasize that the FDA granted an orphan designation for all 3 indications, including the Duchenne muscular dystrophy, and we received Fast Track designation for pamrevlumab for IPF in locally advanced pancreatic cancer. But most importantly now is there is big interest in our study in Duchenne muscular dystrophy. Specifically, we are conducting in nonambulatory patients.

The data so far that we have announced that the 21 patients who are enrolled in this study, open label, completed 1 year of therapy in the mid of March. We started doing administrative analysis of this data. We are doing this analysis in multiple parameters: pulmonary functions; cardiac functions; muscle functions; and imaging, MRIs. And we have seen a positive results in all these parameters. And I think this is another unique aspect of this drug and for this development of pamrevlumab.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Great. Maybe starting with the IPF program, there are some approved therapies on the market, such as Esbriet from Roche, Intermune and so forth, that have been, I think, quite surprising in terms of the market and become, in many respects, the standard of care for a segment of the population, but there are also some trade-offs with regard to adverse events and so forth. So can you maybe frame for us what percentage of patients are appropriate for Esbriet? And is that a benchmark you think about from a competitive perspective? Or are there patient populations where you think a need is not being met currently by some of the approved therapies?

Elias Kouchakii

Senior Vice President of Clinical Development, Drug Safety & Pharmacovigilance

So there is very clear an unmet need for a patient population who are either being treated and did not respond or treated and could not tolerate. And additionally, there is a patient population who has declined totally the treatment due to the fact that they're concerned over the safety of these 2 molecules. As you know that for pirfenidone, the skin toxicity, that this can prevent a lot of people from performing their daily activities. And then liver toxicity could not be dismissed in nintedanib. This population, if it is left out, as there is nothing else they can get into and this population required it, and I think this is the population at this time we are addressing.

And we think pamrevlumab, if the Phase III study is successful, could be at the same time the first-line therapy for all patients before any other patients. So that's why we are emphasizing to enroll our patients, the patients who are currently not on treatment. This, at the same time, could be an ethical thing because just trying to re-treat the patient who is treated is not sufficient, as we are leaving a big section of the population that's never been addressed.

Kvuwon Choi

Goldman Sachs Group Inc., Research Division

Great. And maybe just in terms of the patient sizing. What percentage of the population do you think that would describe roughly, Elias?

Elias Kouchakii

Senior Vice President of Clinical Development, Drug Safety & Pharmacovigilance

I think at this time, our assessment, this population is between 40% to 50% of the population.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

In IPF?

Elias Kouchakji

Senior Vice President of Clinical Development, Drug Safety & Pharmacovigilance

In IPF. Yes. And I would just emphasize the IPF diagnosis is improving especially with the new diagnosis, that is, guidelines which were put in 2018 in ERS by Raghu and that is going to increase the number of subjects who is going to be diagnosed with IPF.

Thomas B. Neff

Founder, Chairman & CEO

One of our briefing partners for FDA, Dr. Luca Richeldi, went through all these populations, and FDA reviewers were really surprised how much the 2 approved therapies had fallen into disuse for various reasons. And that's a key aspect of why we're allowed to go ahead.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Maybe just to frame -- help investors understand and frame expectations, can you maybe just review for us what the prior clinical data has shown? And how do you think about that translating into your larger Phase III population?

Elias Kouchakji

Senior Vice President of Clinical Development, Drug Safety & Pharmacovigilance

I think it's very important to share that -- to remind everyone, first of all, from the FVC decline, we showed a much bigger -- a slower decline in FVC versus placebo compared to other 2 products. I'm not going to say instead we are a direct comparison, but at the same time, our study is against placebo and has reached a statistical significance in Phase II studies, which is not really required. And that one of the biggest aspect. There is another aspect as is we take a look at the patient who declined, and a patient decline is considered, you had a patient decline more than 10% in FVC percent predicted or died on the studies. If you take a look at that difference between these 2 study arms, there is proportionally 60% more decline in the placebo for this. And if you take a look at the other 2 products, they have not shown that big margin in differentiation in the severe decline.

The third part, which again is unique to pamrevlumab, is our QHR CT, the quantitative high-resolution CT scans measuring the fibrosis. And this we've shown time and time again, we did it in 049 study and similarly in 067 study that we've shown that the fibrosis in some patients, at least 1/3 of these patients have stabilization or decrease in the total volume of the fibrosis, that is, in either any of these 2 molecules have shown that they can capable to do.

Thomas B. Neff

Founder, Chairman & CEO

There are no other positive results with HR CT besides the ones that we have. Yes.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Maybe shifting gears, in the time left we have, to the pancreatic side. This historically, obviously, has been a very, very tough solid tumor to treat. And can you maybe -- what is the case for optimism here for making the investment? What have you seen so far that supports do you think proceeding here just given that the historical success rate obviously has been very, very low here in this area?

Elias Kouchakji

Senior Vice President of Clinical Development, Drug Safety & Pharmacovigilance

It's hard to say that, as I mentioned, that this is especially -- we are going after a special population, a subpopulation, which is very hard to treat. Usually, these patients have best outcome if they can be going to surgery. There is a limitation of involvement of the tumors around the vessels that's prevented them from being resectable. The uniqueness of our Phase II study is that we increase the resection in this population to 33%. But if we take a look into the resectability, that is another big assessment, that is, the patient can go to the surgeon and assess for the resection. So that has increased to 75%.

So we think we have a very unique proposition here that we can change the positioning of the tumors and make the tumors more selective for resection. And that is exciting at the same time due to the fact that FDA stated that if our Phase III study showed a resection rate favorable of pamrevlumab assays will be sufficient for it to be considered a surrogate endpoint for accelerated approval, this is exciting for someone like me who is a surgeon by training, which is a transplant surgeon. We do resect pancreatic cancer. And that is a very important part, that is, we are looking for something that can help us bring this patient assays. At the same time, went and said very clearly, patient resected, and resection has a link to increase of time of survival. That is very well documented, and that is what we are looking for.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Great. So I don't know how you keep track of all these programs, but you're also working on DMD as well. And I guess, my question here is that the landscape in DMD has been one of the biggest focal points in biotech for the past couple of years, and you are also seeing gene therapy approaches being developed. And so how do you think about, I guess, that perhaps potentially affecting the market opportunity in the nonambulatory population, if there is some sort of clinical success? Does that change your opportunity in terms of your addressable patient pool? And -- or do you think -- how do you think about that perhaps?

Thomas B. Neff

Founder, Chairman & CEO

So yes, all the things you said are true. We started way before the recent antisense-type genetic targeted molecules got approved and are being used. And the original observation was you're seeing microinfarcts in the heart with these patients. So it's really like the fibrosis furnace. And then we looked more broadly at dystrophin deletions, and there also were fibrosis furnaces. So we said this is a place where a broad spectrum antifibrotic antibody may have a big impact. We started in the preclinical in 2005. We got cleared by the U.S.-EU board that reviews these things in 2014 for immediate human studies, and we moved straight ahead. We think there will be impact in both nonambulatory and in ambulatory. The evidence shows cardiovascular, pulmonary as well as muscle strength in the studies we're doing now. That date is going to come up pretty soon. So we're very excited about where that's going at the present time.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Great. Thank you for that. Unfortunately, we have run out of time at the moment, but we can continue the questions offline here with the management team off the stage. Thank you.

Thomas B. Neff

Founder, Chairman & CEO

Thank you, Paul.

K. Peony Yu

Chief Medical Officer
Thank you very much, Paul.

Operator

Welcome to the FibroGen's Second Quarter 2019 Financial Results Conference Call. My name is Adrianne, and I'll be your operator for today's call. [Operator Instructions] Please note this conference is being recorded.

I'll now turn the call over to Karen Bergman. Karen Bergman, you may begin.

Karen L. Bergman

Vice President of Investor Relations & Corporate Communications

Thank you, Adrianne. Good afternoon, everyone. And thank you for joining our call. Today, we are reporting financial results and corporate update for the second quarter of 2019. Joining me today on the call are Mr. Tom Neff, Chairman and Chief Executive Officer; Dr. Peony Yu, Chief Medical Officer; Ms. Chris Chung, Senior Vice President of China Operations and Managing Director, FibroGen China; Dr. Elias Kouchakji, Senior Vice President, Clinical Development, Drug Safety and Pharmacovigilance; and Mr. Pat Cotroneo, Chief Financial Officer. Following our prepared remarks, Tom will discuss upcoming milestones and we will open the call to Q&A.

During this call, we may make forward-looking statements regarding our business, including our collaborations with AstraZeneca and Astellas; financial guidance; the initiation, enrollment, design, conduct and results of clinical trials; our regulatory strategies and potential regulatory results; our research and development activities; and certain other business matters.

For risks and uncertainties regarding our business and statements made on the call today as well as factors beyond our control that may cause differences between current expectations and actual results, we refer you to our Annual Report on Form 10-K for the fiscal year ended December 31, 2018, and to our quarterly report on Form 10-Q for the quarter ended June 30, 2019, filed with the Securities and Exchange Commission. Copies of these filings may be found in the Investors section of our website. We undertake no obligation to update any forward-looking statement whether as a result of our new information, future developments or otherwise.

The format for today's call includes remarks from FibroGen's management team, and then we'll open the lines to take your questions. The press release reporting our financial results and business update and a webcast of today's conference call can be found on the Investors section of FibroGen's website at www.fibrogen.com. The webcast will be available for 2 weeks from today's date.

And with that, I'd now like to turn the call over to our CEO, Tom Neff.

Thomas B. Neff

Founder, Chairman & CEO

Thank you, Karen. Welcome everyone, and thank you for joining us. Let's start with our anemia program. We are pleased to report that in our pre-NDA meeting with the FDA regarding roxadustat, we reached an agreement with the agency on the content of the NDA including the cardiovascular safety analysis. This is for both the dialysis and nondialysis dependent CKD populations. We previously announced that we expected the NDA submission in September or October time frame with the clarity arising from our meeting with FDA. We and our partner AstraZeneca have refined our timing to target an October submission, with the MAA for Europe to be submitted thereafter.

We recently announced the publication on July 24, 2 articles in The New England Journal of Medicine of the pivotal studies of roxadustat China Phase III program, 1 reporting the results from China Phase III dialysis or Study 806 and the other reporting the results from China Phase III nondialysis or Study 808. We view publication by the New England Journal of these 2 pivotal studies supporting regulatory approval for roxadustat in China's validation of the scientific and medical importance as well as the quality of clinical research for these studies.

Other updates in China, in December 2018, we announced the approval in China roxadustat for the treatment of CKD anemia and patients receiving dialysis representing the world's first approval for any HIF-PHI. We expect the nondialysis dependent or NDD portion of the CKD indication to be approved for roxadustat in the third quarter of 2019. In a few minutes Dr. Peony Yu will provide further details regarding roxadustat and Ms. Chris Chung will provide updates on China program.

Let's turn to pamrevlumab highlights for the quarter. Starting with Duchenne muscular dystrophy, we presented positive Phase II clinical findings from the first year of treatment in our ongoing study 079 at the Parent Project Muscular Dystrophy or PPMD 2019 Annual Conference in June. Our study suggests pamrevlumab has the potential treatment benefits on heart function, lung function and muscle function in DMD patients. We shall be seeking guidance from the FDA on the design of a Phase III program.

For the treatment of idiopathic pulmonary fibrosis or IPF, we initiated patient dosing in the ZEPHYRUS Phase III randomized, double-blind, placebo-controlled study of pamrevlumab with the primary endpoint of change of forced vital capacity or FVC over 52 weeks. We are enrolling more than 550 patients in this study and we expect to have more than 175 study sites globally.

Turning to pancreatic cancer. This disease is characterized by a high degree of growth of fibrosis characterized as desmoplasia, which is related to extensive CTGF expression. As an anti-CTGF agent, pamrevlumab has the potential to have a meaningful effect on pancreatic cancer. We are preparing to initiate patient dosing in the LAPIS study of Phase III randomized, double-blind, placebo-controlled study of pamrevlumab as a neoadjuvant therapy for patients with unresectable locally advanced pancreatic cancer or LAPC.

Later, on this call, Dr. Elias Kouchakji will discuss the DMD data presented at the PPMD conference and our IPF and pancreatic cancer Phase III trials in more detail. I have a few brief corporate and financial updates for the quarter. Our Chief Financial Officer, Pat Cotroneo, will provide further detail on finance later on the call. In the second quarter, we reported \$116 million in net income or \$1.34 per basic share or \$1.26 per diluted share in EPS. As of June 30, 2019, FibroGen had \$686.1 million in cash. We are privileged to welcome Ms. Suzanne Blaug as a member of FibroGen's Board of Directors. Suzanne is an experienced industry executive and advisor whose deep knowledge and critical commercial marketing and strategic planning experience will be invaluable as we advance our multiple late stage products.

I would now like to ask Dr. Peony Yu to provide updates on the anemia programs. Peony, please go ahead.

K. Peony Yu

Chief Medical Officer

Thank you, Tom. Roxadustat is the first HIF-PHI for treatment of CKD anemia. And it is the largest known CKD anemia program. More than 10,000 CKD patients from 50 countries participated in our global Phase III studies. Over 8,000 of these patients are included in the dialysis or nondialysis pool for MACE analysis for the US and MACE Plus analysis for Europe as primary cardiovascular safety endpoint.

As stated by our US partner AstraZeneca, our Phase III results confirmed the cardiovascular safety of roxadustat. Together with our partners, AstraZeneca and Astellas, we recently had a very good pre-NDA meeting with the FDA on roxadustat. We reached agreement with the FDA on our proposed pool MACE analysis in dialysis and in nondialysis. We are pleased with the agreement for nondialysis as it includes an approach to account for the differential dropout between roxadustat and placebo. With agreement on NDA content and format, we are moving as quickly as we can for a submission. We do have a large submission, at this time, we are targeting October of this year.

For Europe, we are working with Astellas, our EU partner, on MAA preparation based on the Phase III results in the roxadustat program. Astellas has recently updated MAA submission timeline from calendar year 2019 to their fiscal year 2019, which ends March 2020. We look forward to present Phase III study results in upcoming medical conferences such as ASN in November and in peer reviewed journals. In Japan, Astellas submitted NDA for roxadustat treatment of anemia in dialysis-dependent CKD patients in last September. The PMDA's regulatory decision on this NDA is expected this year.

We and our partners AstraZeneca and Astellas are working together on expanding anemia treatment beyond CKD. In MDS, we have 2 ongoing clinical studies, a Phase III US global study in transfusion-dependent MDS patients and a Phase II/III study in nontransfusion-dependent MDS patients in China. We are now starting a Phase II US study of roxadustat for treating chemotherapy-induced anemia on track for starting this quarter.

I now like to turn the call back over to Tom.

Thomas B. Neff

Founder, Chairman & CEO

Thank you, Peony. Next, I'd like to ask Chris Chung, who heads our China operations to offer some comments on roxadustat in China, our country of first approval. Chris, please go ahead.

Christine L. Chung

Senior Vice President of China Operations

Thanks, Tom. It's been a productive quarter on the China front. We have been projecting a Q3 commercialization date. Certification of our commercial API plant in Cangzhou, the gating factor, was achieved in May. I'm pleased to share the news with everyone that the first batches of commercial roxadustat capsules have been shipped. We all know that affordability for our patients is critical to widespread market adoption. Government reimbursement for roxadustat is something that we're actively pursuing, historically, as taken a number of years after NDA approval before a drug is reimbursed by the Chinese government.

We have made this as a base case assumption. Until we secure government reimbursement, the near-term market adoption rate will be slow. Nonetheless, we believe we have a strong case for roxadustat to be included for reimbursement sooner rather than later, given the scope of the unmet medical need, the novel treatment pathway, the strength of our clinical data and the fact that access to innovative medicines is a top national priority. It is still too early to tell if roxadustat will be included in the 2019 reimbursement cycle, but we should have more clarity by the end of this year.

If reimbursement is not obtained, we will have drug available for patients in the self-pay market, and our market development efforts with AstraZeneca will continue to advance. We remain highly optimistic about the market potential for roxadustat in China. We continue to build momentum [with our] investments in marketing, market access and medical affairs and the AstraZeneca field sales force is being scaled up to address the size of the market opportunity.

I look forward Tom to keeping everyone updated in the exciting months ahead. Now back to you, Tom.

Thomas B. Neff

Founder, Chairman & CEO

Thank you, Chris. Moving on to pamrevlumab, Dr. Elias Kouchakji will provide a few more details on the Phase II data update we recently presented at the PPMD Annual Conference in July, as well as the progress in our Phase III studies in IPF and LAPC. Elias, please go ahead.

Elias Kouchakji

Senior Vice President of Clinical Development, Drug Safety & Pharmacovigilance

Thank you, Tom. I would like to start with our work in Duchenne muscular dystrophy. As Tom mentioned, we presented positive Phase II primary clinical data of the first full year of treatment in all 21 nonambulatory Duchenne muscular dystrophy patients at the PPMD 2019 Annual Conference in June, notably, on cardiac function fibrosis and muscle function.

It is important to note the decline in cardiac function is the leading cause of mortality in nonambulatory Duchenne muscular dystrophy. In this study, we showed an increase in estimated mean change from baseline and left ventricular ejection fraction, also known as LVF, of positive 0.29% versus what is in expected decline in LVF. Additionally, a correlation between improvement in LVF and reduction in cardiac fibrosis was presented. Neither of these results has been previously reported in scientific literature.

Speaking of the [indiscernible] nonambulatory Duchenne muscular dystrophy patient, we know this will eventually lead to the further reduction of their quality of life. The results of upper arm muscle function and muscle fibrosis patch showed mean change in pull from baseline of a decline of 1.53, demonstrating a potential meaningful reduction in the rate of the decline in comparison to the published data. Additionally, the results of estimated mean change in the grip strength score were positive and showed a score increase in both dominant and in nondominant hands at 1 year of treatment with pamrevlumab. The grip strengthen in this population typically is expected to decline. In this study, pamrevlumab was well tolerated. We are particularly excited by this result in the nonambulatory population, which to-date has been the subject of extremely limited clinical trials. We shall be seeking guidance from the FDA on the design of our Phase III program.

Moving to our program in IPF. We have initiated dosing in ZEPHYRUS Phase III study in IPF, a randomized, double-blind placebo-controlled Phase III clinical trial with the primary endpoints of a change in forced vital capacity, FVC, from baseline in approximately 565 patients to confirm efficacy and safety results we have seen in our Phase II studies. ZEPHYRUS Phase III study is similar in design to our Phase II placebo-controlled study, PRAISE. The objective is to confirm the positive efficacy and safety results previously reported in PRAISE, in which pamrevlumab treatment attenuated the progression of IPF and was well tolerated.

Last but not least, I will be turning to the pancreatic cancer study. We are screening patient for LAPIS Phase III study in pancreatic cancer, a randomized, double-blind, placebo-controlled Phase III study evaluating pamrevlumab as a neoadjuvant therapy for unresectable locally advanced pancreatic cancer. This study will enroll approximately 260 patients on standard of care. A standard of care is defined as a treatment to gemcitabine and nab-paclitaxel, and will be randomized to either pamrevlumab or placebo. In this study, we will be evaluating the rate of resection and overall survival. We believe that pamrevlumab can provide a new therapy to patient with IPF, LAPC and Duchenne muscular dystrophy, each of which are serious and fatal disease.

Thank you for listening and now I'll turn the call back to Tom.

Thomas B. Neff

Founder, Chairman & CEO

Thank you, Elias. Our Chief Financial Officer, Pat Cotroneo, will now walk through the financial results for the second quarter of 2019 and our financial outlook through fiscal year 2019. Pat, please proceed.

Pat Cotroneo

Senior VP of Finance & CFO

Thank you, Tom. As announced today, total revenue for the quarter ended June 30, 2019, was \$191.6 million as compared to \$44 million for the second quarter of 2018. For the same period, operating expenses were \$78.7 million and net income was \$116 million or \$1.34 per basic share and a \$1.26 per diluted share as compared to operating expenses of \$67.2 million and the net loss of \$23.4 million or \$0.28 per basic and diluted share for the second quarter last year.

Included in operating expenses for the quarter ended June 30, 2019, was an aggregate noncash portion totaling \$21.9 million, of which \$17.6 million was a result of stock-based compensation expense, as compared to an aggregate noncash portion totaling \$15.2 million, of which \$13.2 million was a result of stock-based compensation expense for the same period in the prior year.

In accordance with US GAAP, in the second quarter, we are including in our revenue recognition methodology a total of \$180 million comprised of \$50 million for an anticipated milestone from AstraZeneca relating to the filing of the US NDA and the \$130 million in anticipated milestones from Astellas in connection with the EU MAA filings. Out of the \$180 million, \$171.1 million was recognized in the current quarter and the remaining balance will be recognized in future periods. Under the current US GAAP revenue recognition guidelines, we are required to include estimated consideration from milestones in the determination of revenue recognition in the period that milestone achievement becomes probable.

The timing of when the payments related to these not milestones will be remitted to FibroGen depends upon when the milestones are actually achieved.

As noted earlier on this call, timing for the NDA filing is targeted for October of this year, and we expect the Astellas MAA submission to occur in the second half of the Astellas 2019 fiscal year with MAA filing in early 2020. Previously, we had reported as any cash range of \$720 million to \$730 million. Adjusting for our latest forecast, we would increase our 2019 ending cash estimate to \$740 million to \$750 million. Given that the milestone payments could move into next year, I'd like to provide additional scenarios. Assuming that the EU MAA filing is done and completed in 2020 and the \$130 million and associated milestones are paid at that time, our current anticipated ending 2019 cash range will be approximately \$610 million to \$620 million. This ending cash range assumption also includes a \$50 million milestone from AstraZeneca for the filing of the US NDA, which should occur within 60 days after NDA submission. At June 30, 2019, FibroGen had \$686.1 million in cash, restricted time deposits, cash equivalents, investments and receivables.

Thank you, and I would now like to turn the call back over to Tom.

Thomas B. Neff

Founder, Chairman & CEO

Thank you, Pat. Let's wrap up by pointing out to some key events ahead. For roxadustat in the US, we anticipate submitting our NDA -- to the US FDA for the treatment of anemia associated with dialysis-dependent and nondialysis-dependent CKD in October 2019. We expect the EU MAA to be submitted by our partner Astellas thereafter. In China, we expect to add nondialysis-dependent CKD patients to the roxadustat label in Q3 2019. We also expect to initiate our Phase II study of roxadustat for the treatment of chemotherapy-induced anemia in this quarter.

For pamrevlumab, we are pushing forward with 3 indications in the mid- to late-stage development and we are looking forward to keeping you updated on those activities including an IPF progression of our ZEPHYRUS Phase III IPF study and locally advanced pancreatic cancer or LAPC initiation and progression of our LAPIS Phase III study.

In DMD, having reported on the first year of treatment and our ongoing Phase II DMD study and now advancing our patients through their second third and fourth years of treatment, we plan to seek guidance from the FDA on the design of a Phase III program.

With that, let me turn this back to Karen to begin the question-and-answer session. Karen, please go ahead.

Karen L. Bergman

Vice President of Investor Relations & Corporate Communications Thank you, Tom. Adrianne, please open up the line for questions.

Question and Answer

Operator

[Operator Instructions]

Karen L. Bergman

Vice President of Investor Relations & Corporate Communications

We are set for our first question; I think it's from Michael Yee.

Michael Jonathan Yee

Jefferies LLC, Research Division

Two questions. One is for Tom, what were the 2 or 3 most important things that you guys discussed with the FDA or topics or key issues regarding approvability in your meeting? And then, separately, regarding the statistical plan, there seems to be a concern about noninferiority on MACE, not MACE Plus, but MACE. Can you talk to your confidence around the statistics and whether that's an issue for the FDA?

Thomas B. Neff

Founder, Chairman & CEO

Peony, go ahead.

K. Peony Yu

Chief Medical Officer

Hi, Mike. This is Peony. In the FDA meeting, we have accomplished what we intended for the meeting. You asked about the important agreement or achievement. I will name that. We have gained FDA's agreement on our proposal for a single primary safety cardiovascular endpoint analysis for dialysis, as well as cardiovascular safety primary endpoint for nondialysis.

And in terms of the way that the time to MACE primary endpoint is being analyzed in nondialysis, this will account for differential drop out between our drug and placebo, whereas you know that because placebo doesn't work in treating anemia, placebo patients had a tendency to drop out earlier. And we have reached agreement on statistical method that accounts for that. You have asked about our confidence on noninferiority on MACE. At this time, with these understanding, level of confidence is very high and we do believe as AstraZeneca has stated that our Phase III results confirm cardiovascular safety of roxadustat in the CKD population in both dialysis and nondialysis.

Thomas B. Neff

Founder, Chairman & CEO

And Mike, I would add that what I saw was that we gained a lot of clarity across the board and both our team and AZ's team reflected a very high degree of confidence coming out of the meeting. So, there is detailed planning right now, how to get everything done in October early and so everybody is aggressively moving ahead.

Operator

And the next question comes from Geoff Porges from SVB Leerink.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

And I have to ask some follow-up questions. Could you confirm whether you have written minutes from the meeting with the agency? And then, Peony, you mentioned the exposure adjusted analysis of the time to first MACE event but could you -- we haven't seen that analysis. But, presumably you have run it already. Can you tell us either what the absolute rates when you adjust for exposure between the 2 groups and nondialysis group or at least what range, where they are in terms of relation to each other?

And then, could you explain the amendment in your Q that the European regulator is going to look at MACE as well as MACE Plus. Is that the result of a conversation or meeting and does that make you less confident or any change to your confidence about the European application?

Thomas B. Neff

Founder, Chairman & CEO

Geoff let me deal with the last issue first. There's no back story on the MACE, MACE Plus for Europe that we're aware of. So I think just take at face value. Peony, go ahead and address Geoff's other questions please.

K. Peony Yu

Chief Medical Officer

Geoff, we had our FDA meeting towards the end of July. So usually it will take a little bit longer before we received a meeting minutes. What I'm reporting to you is based on our exchange with the FDA and there was sufficient clarity for us to be sharing what we had just said. Okay?

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Great, thanks.

Operator

And our next question comes from Joel Beatty from Citi.

Joel Lawrence Beatty

Citigroup Inc, Research Division

Recently at the end of July there was a New England Journal of Medicine publication and Phase III results from China. There was also an editorial in there that generally seems favorable, talked about hyperkalemia and the studies with a little bit of reservation. Would you be able to address that, the potential to use roxadustat in patients with hyperkalemia? And then, also discuss from the US EU Phase III results if that was a finding that seemed to show up?

Thomas B. Neff

Founder, Chairman & CEO

So, Joel, as a starting point here, the editorial work and such with these 2 articles for New England Journal was quite aggressive, intensive and so on, for about a month. And the topic of safety discussion came up right at the end at their editorial board's suggestion. So it was a little surprising. I think Peony can explain how we see it. Go ahead Peony.

K. Peony Yu

Chief Medical Officer

Thanks, Tom. That was intensive. So I believe that we had previously discussed hyperkalemia in or around November after ASN last year. And coming back to New England Journal, yes, it was reported that there was an apparent imbalance of hyperkalemia reported as adverse events by investigators in the 2 China Phase III studies. Now, New England Journal supplement for these 2 manuscripts also showed that there is no imbalance in the hyperkalemia when we reported the analysis based on central lab data. Just as a background on CKD patients, elevation of blood potassium level is consistent and characteristic of CKD patient populations, because the diseased kidneys are not able to properly regulate potassium levels and acid base balance.

To address your questions on the larger Phase III program that has been reported and that indeed is another -- is a good way to further look into this question. So, from what we have seen the reported incidence rates of hyperkalemia adverse events were comparable between roxadustat and comparator arms in the dialysis and the nondialysis studies. Also, the analysis of potassium central lab values also

suggests, there is a hyperkalemia risk with the use of roxadustat. We look forward to presenting the results from these much larger and longer Phase III studies in upcoming medical conferences.

Operator

And our next question comes from Difei Yang from Mizuho.

Difei Yang

Mizuho Securities USA LLC, Research Division

On the roxadustat NDA filing, would you remind us who's primarily responsible to submit the NDA, is it AstraZeneca or is it FibroGen?

Thomas B. Neff

Founder, Chairman & CEO

I will have Peony address this, please.

K. Peony Yu

Chief Medical Officer

Yes, AstraZeneca is a very good partner in the US. In terms of roles and responsibility, FibroGen is the IND holder. And we are also the party responsible for the final, putting together the file and submitting to the FDA. In terms of ways of working together, we have a highly collaborative relationship with both of our partners. And we have frequent communication as well as generating the study results together.

Difei Yang

Mizuho Securities USA LLC, Research Division

Now changing subject to IPF, you have started recruiting for the Phase III, would you remind us when should we be expecting top-line results?

Thomas B. Neff

Founder, Chairman & CEO

Elias, please go ahead.

Elias Kouchakji

Senior Vice President of Clinical Development, Drug Safety & Pharmacovigilance

Difei, its Elias. We just started enrolling in this study. This study will have to enroll across a little bit over 550 patients. This is going to take a little time to enroll as we have seen in all IPF studies. When the last patient is enrolled and have a 1-year of treatment, this is what we consider the end of the study and at that time would be possibly can see this data between the late 2022 and early 2023.

Operator

And our next question comes from Adam Walsh from Stifel.

Xiaodong Zhang

Stifel, Nicolaus & Company, Incorporated, Research Division

This is Edwin on for Adam. Congrats again on the progress made in the last quarter. So I have a few questions, if I may. My first question is on incident dialysis. So what is your filing and commercial strategy over there? So based on the efficacy and safety data, do you expect this incident dialysis patient population will be defined and listed in the [indiscernible] label if approved. And similarly, can you also comment on the nondialysis setting? So what is your strategy and view there? And I have a follow up questions.

Thomas B. Neff

Founder, Chairman & CEO

Peony, you can address incident dialysis first.

K. Peony Yu

Chief Medical Officer

Okay. Thank you for the question, Adam.

Thomas B. Neff

Founder, Chairman & CEO

Not Adam. It's Edwin.

K. Peony Yu

Chief Medical Officer

Oh, Edwin. I'm sorry. So in terms of our submission, we are seeking approval for treating CKD anemia in our dialysis as the primary patient indicate -- as the primary indication and also nondialysis. Now for incident dialysis, we do believe that this is a very important subgroup in -- which is part of our dialysis. The reason that we say that and also have this discussion supported -- this discussion with our medical reviewer is that, oftentimes anemia therapy starts around the time of dialysis initiation and we continue to follow the patients during the course of treatment anemia drug as well as during the course of dialysis. And now given the importance of this information for prescribing physician, they do feel that information on the outcome of the incident dialysis patients are important to prescriber and we expect this to have positive impact on commercial potentials. Our FDA medical reviewer has suggested additional analysis and whether -- and as far as labeling that will be a review issue.

Thomas B. Neff

Founder, Chairman & CEO

The second question was about NDD, is that correct?

Xiaodong Zhang

Stifel, Nicolaus & Company, Incorporated, Research Division

Yes.

Thomas B. Neff

Founder, Chairman & CEO

Okay. So Peony, please address NDD. Can you restate your full question for NDD?

Xiaodong Zhang

Stifel, Nicolaus & Company, Incorporated, Research Division

Similar to the incident dialysis population, what is your filing and the commercial strategy? And also, maybe comment on the potential competition because you set a high bar in safety [indiscernible] to placebo.

Thomas B. Neff

Founder, Chairman & CEO

Peony, go ahead.

K. Peony Yu

Chief Medical Officer

Yes. So we are very pleased with the agreement on the primary safety analysis of our primary cardiovascular safety endpoint in NDD. We had -- because when we were considering the value of a drug whether from a medical point of view and commercial point of view is looking at benefit and risk. And we are very pleased with the positive efficacy results for anemia therapy not only just to keep hemoglobin level up, but also reduce blood transfusion risk as well as attenuation of renal progression that we have previously reported.

Now, on the safety side, the ability to demonstrate a drug is as safe as placebo, which is a very high bar because placebo is considered -- to give the drug an opportunity to show how safe it is based on its own merit. And the fact that our drug has a placebo comparator and also it is orally administered, which makes it accessible to patients, we believe that we will, or we will have an opportunity to address the unmet medical need and expand the market beyond what ESA is able to do as -- and we both we and our partner AstraZeneca believe that the nondialysis market is larger than that of the dialysis market.

Thomas B. Neff

Founder, Chairman & CEO

Potential market in nondialysis is larger than the current market in dialysis. I think we will probably decline to comment on the competitive aspects. Did you have any other questions?

Operator

He has left the queue.

Thomas B. Neff

Founder, Chairman & CEO

Thank you.

Operator

We do have a question from Danielle Brill from Piper Jaffray.

Nirav Y. Shelat

Piper Jaffray Companies, Research Division

This is Nirav on for Danielle. I just had 2, regarding a question that was asked earlier. I'm not sure if it was answered. Would you be able to tell us with the data that you currently have and this statistical analysis that you're doing with the absolute rates where, when you adjust for the drop outs?

Thomas B. Neff

Founder, Chairman & CEO

We won't be able to discuss that until later in the process.

Nirav Y. Shelat

Piper Jaffray Companies, Research Division

And the other question I had was regarding the IPF study. I was wondering with the enrollment currently ongoing, if you could give us some color on the geography of the sites? And how many sites are in the United States versus ex-US and if we should expect a significant amount of patients to come ex-US.

Thomas B. Neff

Founder, Chairman & CEO

These are targets now, we haven't accomplished this yet, so Elias, please go ahead and explain.

Elias Kouchakii

Senior Vice President of Clinical Development, Drug Safety & Pharmacovigilance

Sure. The target is -- the majority would be from the US and this is globally as is other similar product, which is running globally. We are going in the EU and all other regions, Southeast and the potential number of patients coming from the US versus ex-US. We still are targeting to have a very large number from the patients who come from US at the same time. We are seeing this as a very good number of sites that are rolling and eager to be part of our study.

Operator

And this concludes the question-answer-session. I'll now turn the call back over to Tom Neff for final remarks.

Thomas B. Neff

Founder, Chairman & CEO

Let me say it's incredibly gratifying to see the advancement of roxadustat and pamrevlumab programs, and the recognition of their potential by the medical community as seen by the recent publications of our various clinical results. This is a testament to years of hard work on the part of our dedicated employees. We cannot thank enough to the patients and to their families and to physicians and to investigators, who are participating in our studies. We all have the same goal of expanding therapeutic options for patients who need them.

Thank you also to our shareholders, who have followed our story and are seeing the advancement and development of ideas born in our research lab. I'd like to wish everyone a good afternoon and evening. Thank you for joining our call.

Operator

Thank you, ladies and gentlemen. This concludes today's conference call. Thank you for participating and you may now disconnect.

ITEM 2. MANAGEMENT'S DISCUSSION AND ANALYSIS OF FINANCIAL CONDITION AND RESULTS OF OPERATIONS.

You should read the following discussion and analysis of our financial condition and results of operations in conjunction with the condensed consolidated financial statements and the notes thereto included elsewhere in this Quarterly Report on Form 10-Q, and in our Securities and Exchange Commission ("SEC") filings, including our Annual Report on Form 10-K for the year ended December 31, 2018 filed with the SEC on February 27, 2019.

FORWARD-LOOKING STATEMENTS

The following discussion and information contained elsewhere in this Quarterly Report on Form 10-Q contain "forward-looking statements" within the meaning of Section 21E of the Securities Exchange Act of 1934, as amended ("Exchange Act"), Section 27A of the Securities Act of 1933, as amended ("Securities Act") and within the meaning of the Private Securities Litigation Reform Act of 1995. These statements are often identified by the use of words such as "may," "will," "expect," "believe," "anticipate," "intend," "could," "should," "estimate," or "continue," and similar expressions or variations. Such forward-looking statements are subject to risks, uncertainties and other factors that could cause actual results and the timing of certain events to differ materially from future results expressed or implied by such forward-looking statements. Factors that could cause or contribute to such differences include, but are not limited to, those discussed in the section titled "Risk Factors," set forth in Part II, Item 1A of this Quarterly Report on Form 10-Q. The forward-looking statements in this Quarterly Report on Form 10-Q represent our views as of the date of this Quarterly Report on Form 10-Q. We anticipate that subsequent events and developments will cause our views to change. New risks emerge from time to time, and it is not possible for our management to predict all risks, nor can we assess the impact of all factors on our business or the extent to which any factor, or combination of factors, may cause actual results to differ materially from those contained in any forward-looking statements we may make. In light of these risks, uncertainties, and assumptions, the forward-looking events and circumstances discussed in this Quarterly Report on Form 10-Q may not occur, and actual results could differ materially and adversely from those anticipated or implied in the forward-looking statements. While we may elect to update these forward-looking statements at some point in the future, we have no current intention of doing so except to the extent required by applicable law. You should, therefore, not rely on these forward-looking statements as representing our views as of any date subsequent to the date of this Quarterly Report on Form 10-Q and are cautioned not to place undue reliance on such forward-looking statements.

BUSINESS OVERVIEW

We were incorporated in 1993 in Delaware and are headquartered in San Francisco, California, with subsidiary offices in Beijing and Shanghai, People's Republic of China ("China"), is a leading biopharmaceutical company discovering and developing a pipeline of first-in-class therapeutics. We apply our pioneering expertise in hypoxia-inducible factor ("HIF"), connective tissue growth factor ("CTGF") biology, and clinical development to advance innovative medicines for the treatment of anemia, fibrotic disease, and cancer. Roxadustat, our most advanced product candidate, is an oral small molecule inhibitor of HIF prolyl hydroxylase ("HIF-PH") activity, completing Phase 3 clinical development worldwide for the treatment of anemia in chronic kidney disease ("CKD"), with a New Drug Application ("NDA") now approved by the National Medical Products Administration ("NMPA") in China. We and our collaboration partners AstraZeneca AB ("AstraZeneca") and Astellas Pharma Inc. ("Astellas") are in the process of preparing an NDA for submission to the United States ("U.S.") Food and Drug Administration ("FDA") and a Marketing Authorization Application ("MAA") for submission to the European Medicines Agency ("EMA") this year. Astellas submitted an NDA for the treatment of anemia in CKD patients on dialysis in Japan in September 2018, which is currently under review by the Pharmaceuticals and Medical Devices Agency ("PMDA"). Roxadustat is in Phase 3 clinical development in the U.S. and Europe and in Phase 2/3 development in China for anemia associated with myelodysplastic syndromes ("MDS"). Pamrevlumab, an anti-CTGF human monoclonal antibody, is in Phase 3 clinical development for the treatment of idiopathic pulmonary fibrosis ("IPF"), and advancing towards Phase 3 for the treatment of pancreatic cancer. Pamrevlumab is also currently in a Phase 2 trial for Duchenne muscular dystrophy ("DMD"). We are also developing a biosynthetic cornea in China.

						June 30, 2019	De	cember 31, 2018
						(in tho	usand	ls)
Balance Sheet								
Cash and cash equivalents					\$	74,587	\$	89,258
Short-term and long-term investments					\$	597,089	\$	587,964
Accounts receivable					\$	6,453	\$	63,684

Our revenue for the three and six months ended June 30, 2019 increased compared to the same periods a year ago. Our revenue for the current year periods primarily consisted of the recognition of \$129.5 million of two regulatory milestones totaling \$130.0 million that were included in the transaction price during the second quarter of 2019 when these milestones became probable of being achieved. These milestones are associated with the planned MAA submission to the EMA under the collaboration agreement with Astellas for roxadustat as a treatment for dialysis and non-dialysis CKD patients. In addition, the revenue recognized during the current year periods included the recognition of \$41.6 million of a \$50.0 million regulatory milestone that was included in the transaction price during the second quarter of 2019 when this milestone became probable of being achieved. This milestone is associated with the planned NDA submission to the FDA under the collaboration agreement with AstraZeneca for roxadustat as a treatment for dialysis and non-dialysis CKD patients. As comparison, our revenue for the prior year period included the recognition of \$14.9 million of a \$15.0 million regulatory milestone associated with NDA submission in Japan under the collaboration agreement with Astellas for roxadustat for the treatment of anemia in Japan that was included in the transaction price during the second quarter of 2018 when this milestone became probable of being achieved. The increases were partially offset by a decrease in co-development billings related to the development of roxadustat as a result of the substantial completion of Phase 3 trials for roxadustat.

Operating expenses for the three months ended June 30, 2019 increased compared to the same period a year ago primarily due to \$9.2 million higher outside service expenses related to co-promotional activities and scientific contract expenses, \$4.4 million higher stock-based compensation related to the cumulative impact of stock option grant activities, \$2.6 million amortization of finance lease right-of-use ("ROU") assets related to the adoption of lease accounting guidance under Accounting Standards Codification ("ASC") 842 - Leases ("ASC 842") and \$1.1 million higher depreciation expenses due to the change in estimated useful life for our leasehold improvements as a result of the adoption of ASC 842. The increases were partially offset by \$3.4 million lower clinical trial expenses related to lower activities for roxadustat offset by higher activities for pamrevlumab, and \$2.5 million lower drug development expenses associated with drug substance manufacturing activities related to pamrevlumab.

Operating expenses for the six months ended June 30, 2019 increased compared to the same period a year ago primarily due to \$11.4 million higher outside service expenses related to co-promotional activities and scientific contract expenses, \$10.0 million higher stock-based compensation related to the cumulative impact of stock option grant activities, \$5.2 million amortization of finance lease ROU assets related to the adoption of lease accounting guidance under ASC 842, \$2.3 million higher depreciation expenses due to the change in estimated useful life for our leasehold improvements as a result of the adoption of ASC 842 and \$1.8 million higher employee-related expenses resulting from higher average compensation level. The increases were partially offset by \$11.7 million lower clinical trial expenses related to lower activities for roxadustat offset by higher activities for pamrevlumab, \$6.2 million lower drug development expenses associated with drug substance manufacturing activities related to pamrevlumab.

Table of Contents

During the three months ended June 30, 2019, we had a net income of \$116.0 million, or net income per basic share of \$1.34, and net income per diluted share of \$1.26, as compared to a net loss of \$23.4 million for the same period a year ago, due to an increase in revenue partially offset by an increase in operating expenses. During the six months ended June 30, 2019, we had a net income of \$70.6 million, or net income per basic share of \$0.82, and net income per diluted share of \$0.77, as compared to a net loss of \$64.8 million for the same period a year ago, due to an increase in revenue partially offset by an increase in operating expenses.

Cash and cash equivalents, investments and accounts receivable totaled \$678.1 million at June 30, 2019, a decrease of \$62.8 million from December 31, 2018, primarily due to the cash used in operations, partially offset by the accounts receivable at December 31, 2018 collected during the year.

Programs

Roxadustat for the Treatment of Anemia in Chronic Kidney Disease

Roxadustat is our most advanced product candidate, an oral small molecule inhibitor of HIF-PH activity that acts by stimulating the body's natural pathway of erythropoiesis, or red blood cell production. We received our first NDA approval in China for roxadustat for the treatment of anemia caused by CKD in dialysis patients in December of 2018.

We have reported top line efficacy data from individual studies and safety data for the pooled non-dialysis population and the pooled dialysis population, as well as the incident dialysis subpopulation, from the roxadustat Phase 3 trials intended to support our NDA in the U.S. and MAA in the European Union ("EU") for the treatment of anemia in CKD.

In our pre-NDA meeting with the FDA, we reached agreement on the content to be included in our NDA submission package for roxadustat for treatment of anemia in CKD, including the cardiovascular safety analyses for both CKD-dialysis and CKD-non-dialysis. The agreement for non-dialysis is an approach to account for the differential dropout between roxadustat and placebo observed in our Phase 3 studies. We are confident we have sufficient data for FDA review of our NDA in both CKD dialysis and CKD non-dialysis and we are planning to submit the NDA in October of 2019. Our partner Astellas is planning for an MAA submission to the EMA during the second half of their fiscal year 2019, which ends on March 31, 2020.

In China, we have secured regulatory approval of our commercial active pharmaceutical ingredient ("API") plant in Cangzhou, Hebei. We have subsequently produced commercial batches of API and shipped commercial drug product. Roxadustat is currently approved for the treatment of anemia in CKD patients on dialysis. We expect non-dialysis CKD patients to be added to the roxadustat label in the third quarter of 2019.

In Japan, Astellas submitted an NDA for roxadustat for the treatment of anemia in CKD patients on dialysis in September 2018, which is currently under review by the PMDA. We expect an approval decision on the Japan dialysis NDA in the second half of 2019. Astellas has announced it expects the second non-dialysis study in Japan to be completed in 2019.

Roxadustat for the Treatment of Anemia in Myelodysplastic Syndromes

In addition to anemia in CKD, we are continuing to enroll the 156-patient double-blind, placebo-controlled portion of our global Phase 3 clinical study of roxadustat in transfusion-dependent, lower risk MDS patients. The primary endpoint is the proportion of patients who achieve transfusion independence.

In China, we continue to enroll the open-label portion of our Phase 2/3 clinical trial to evaluate the safety and efficacy of roxadustat in non-transfusion dependent, lower risk MDS patients with anemia. After the open-label portion we expect to begin the 135-patient double-blind, placebo-controlled Phase 3 portion of the study, in which subjects will be randomized 2:1 to receive roxadustat or placebo three-times weekly for 26 weeks. The primary endpoint for this study is percentage of patients achieving a hemoglobin response.

Roxadustat for the Treatment of Anemia in Chemotherapy Induced Anemia

We plan to initiate a Phase 2 clinical trial of roxadustat in the U.S. in chemotherapy induced anemia in the third quarter of 2019.

Pamrevlumab (FG-3019) - Monoclonal Antibody Against Connective Tissue Growth Factor (CTGF)

Pamrevlumab is our human monoclonal antibody that inhibits the activity of CTGF, a central mediator and critical common element in the progression of fibrotic and fibro-proliferative diseases. We initiated our Phase 3 clinical trial of pamrevlumab for the treatment of IPF and are screening patients in our Phase 3 clinical trial for locally advanced unresectable pancreatic cancer. We recently presented topline results from our 1-year data from our ongoing Phase 2 trial for DMD.

In the U.S., pamrevlumab has received orphan drug designation for DMD in addition to IPF and pancreatic cancer, and Fast Track designation for the treatment of both IPF patients and patients with locally advanced unresectable pancreatic cancer from the FDA.

Idiopathic Pulmonary Fibrosis

We recently began enrolling ZEPHYRUS, our double-blind, placebo-controlled Phase 3 trial of pamrevlumab in approximately 565 IPF patients. This study is powered to meet the FDA requirement of a highly statistically-significant result in the primary efficacy endpoint of change from baseline in forced vital capacity ("FVC").

Locally Advanced Unresectable Pancreatic Cancer

We are actively screening patients for LAPIS, our double-blind placebo controlled Phase 3 trial of pamrevlumab as a neoadjuvant therapy for locally advanced unresectable pancreatic cancer. We intend to enroll approximately 260 patients, randomized 1:1 to receive either pamrevlumab, in combination with gemcitabine and nab-paclitaxel, or placebo with gemcitabine and nab-paclitaxel.

Duchenne Muscular Dystrophy

In DMD, all 21 non-ambulatory patients from our fully enrolled Phase 2 open-label single-arm trial have completed over one year of treatment with pamrevlumab. While we cannot make direct comparisons between our trial and previously published data due to, among other things, differences in subject numbers, baseline characteristics, inclusion/exclusion criteria, treatment protocols, and analysis methods, we are encouraged by the data obtained so far. Pamrevlumab was well tolerated in this study.

In June 2019 at the Parent Project Muscular Dystrophy meeting, we reported topline results from our one-year administrative analysis comparing our Phase 2 data to recent published natural disease history studies of DMD patients.

In pulmonary function tests, the results from our study indicate a potential reduction in the 1-year decline in FVC percent predicted from baseline for our pamrevlumab-treated patients when compared to FVC data of DMD patients (whether such patients were taking steroids or not) published in 2019 by Ricotti. In the 2019 Ricotti study, the DMD patients were not taking any active drug (other than steroids). All of the patients in our Phase 2 pamrevlumab trial were taking steroids. In addition, pamrevlumab showed less decline in both percent predicted forced expiratory volume as compared to previously published study results of Meier in 2016, and in percent predicted peak expiratory flow rate, compared to what was observed in the study by Ricotti in 2019.

Our data showed an increase in cardiac function, measured by mean change of left ventricular ejection fraction ("LVEF"), of 0.29% from baseline for our pamrevlumab-treated patients. Whereas, data published in 2018 by McDonald of DMD patients only on steroids showed a mean LVEF decline of 0.82% from baseline in one year. In a sub-group analysis of pamrevlumab subjects with baseline LVEF greater than 50%, the mean change was an increase in LVEF of 1.79% from baseline.

In muscle function tests, the majority of the results of this Phase 2 study showed the mean change from baseline in our pamrevlumab-treated patients were more favorable than previously published data. Our results showed a positive increase in grip-strength score in both dominant and non-dominant hands at one year of treatment with pamrevlumab, while earlier results from a 2015 study by Seferian showed a decline at one year as expected. In the performance of the upper limb ("PUL") test specifically developed for DMD patients, our pamrevlumab-treated patients had a mean change from baseline of -1.53. In the 2019 study by Ricotti of DMD patients taking either nothing or only steroids, the annual mean change in the PUL test was -4.13. Furthermore, in our study a strong correlation between change in biceps brachii T2-mapping and change in PUL score was observed, demonstrating stabilization and even possible improvement in the muscle fibrosis burden.

Based on our administrative analysis and advice we received from expert advisors, we are planning to share these results with the FDA to discuss pivotal study design in our clinical development plan for DMD.

Collaboration Partnerships for Roxadustat

Our current and future research, development, manufacturing and commercialization efforts with respect to roxadustat and our other product candidates currently in development depend on funds from our collaboration agreements with Astellas and AstraZeneca as described below.

Astellas

In June 2005, we entered into a collaboration agreement with Astellas for the development and commercialization (but not manufacture) of roxadustat for the treatment of anemia in Japan ("Japan Agreement"). In April 2006, we entered into the Europe Agreement with Astellas for roxadustat for the treatment of anemia in Europe, the Commonwealth of Independent States, the Middle East, and South Africa. Under these agreements, we provide Astellas the right to develop and commercialize roxadustat for anemia indications in these territories.

We share responsibility with Astellas for clinical development activities required for the U.S. and the EU regulatory approval of roxadustat, and share equally those development costs under the agreed development plan for such activities. Astellas will be responsible for clinical development activities and all associated costs required for regulatory approval in all other countries in the Astellas territories. Astellas will own and have responsibility for regulatory filings in its territories. We are responsible, either directly or through our contract manufacturers, for the manufacture and supply of all quantities of roxadustat to be used in development and commercialization under the agreements.

The Astellas agreements will continue in effect until terminated. Either party may terminate the agreements for certain material breaches by the other party. In addition, Astellas will have the right to terminate the agreements for certain specified technical product failures, upon generic sales reaching a particular threshold, upon certain regulatory actions, or upon our entering into a settlement admitting the invalidity or unenforceability of our licensed patents. Astellas may also terminate the agreements for convenience upon advance written notice to us. In the event of any termination of the agreements, Astellas will transfer and assign to us the regulatory filings for roxadustat and will assign or license to us the relevant trademarks used with the products in the Astellas territories. Under certain terminations, Astellas is also obligated to pay us a termination fee.

Consideration under these agreements includes a total of \$360.1 million in upfront and non-contingent payments, and milestone payments totaling \$557.5 million, of which \$542.5 million are development and regulatory milestones and \$15.0 million are commercial-based milestones. Total consideration, excluding development cost reimbursement and product sales-related payments, could reach \$917.6 million. The aggregate amount of such consideration received through June 30, 2019 totals \$487.6 million. Additionally, under these agreements, Astellas pays 100% of the commercialization costs in its territories. Astellas will pay us a transfer price, based on net sales, in the low 20% range for our manufacture and delivery of roxadustat.

During the second quarter of 2019, we received positive topline results from analyses of pooled major adverse cardiac event ("MACE") and MACE+ data from its Phase 3 trials evaluating roxadustat as a treatment for dialysis and non-dialysis CKD patients, enabling Astellas to prepare for an MAA submission to the EMA during their fiscal year 2019, which ends on March 31, 2020, following our planned NDA submission to the FDA anticipated in October of 2019. We evaluated the two regulatory milestone payments associated with the planned MAA submission and concluded that these milestones became probable of being achieved in the second quarter of 2019. Accordingly, the total consideration of \$130.0 million associated with these milestones was included in the transaction price and allocated to performance obligations under the Europe Agreement in the second quarter of 2019.

In addition, as of June 30, 2019, Astellas had separate investments of \$80.5 million in the equity of FibroGen, Inc.

AstraZeneca

In July 2013, we entered into the U.S./RoW Agreement, a collaboration agreement with AstraZeneca for roxadustat for the treatment of anemia in the U.S. and all territories not previously licensed to Astellas, except China. In July 2013, through our China subsidiary and related affiliates, we entered into the China Agreement, a collaboration agreement with AstraZeneca for roxadustat for the treatment of anemia in China. Under these agreements we provide AstraZeneca the right to develop and commercialize roxadustat for anemia in these territories. We share responsibility with AstraZeneca for clinical development activities required for U.S. regulatory approval of roxadustat.

In 2015, we reached the \$116.5 million cap on our initial funding obligations (during which time we shared 50% of the joint initial development costs), therefore all development and commercialization costs for roxadustat for the treatment of anemia in CKD in the U.S., Europe, Japan and all other markets outside of China have been paid by Astellas and AstraZeneca since reaching the cap.

Table of Contents

In China, FibroGen (China) Medical Technology Development Co., Ltd. ("FibroGen Beijing") will conduct the development work for CKD anemia, will hold all of the regulatory licenses issued by China regulatory authorities, and will be primarily responsible for regulatory, clinical and manufacturing. China development costs are shared 50/50. AstraZeneca is also responsible for 100% of development expenses in all other licensed territories outside of China. Outside of China, we are responsible, through our contract manufacturers, for the manufacture and supply of all quantities of roxadustat to be used in development and commercialization under the AstraZeneca agreements.

Under the AstraZeneca agreements, we will receive upfront and subsequent non-contingent payments totaling \$402.2 million. Potential milestone payments under the agreements total \$1.2 billion, of which \$571.0 million are development and regulatory milestones and \$652.5 million are commercial-based milestones. Total consideration under the agreements, excluding development cost reimbursement, transfer price payments, royalties and profit share, could reach \$1.6 billion. The aggregate amount of such consideration received through June 30, 2019 totals \$444.2 million.

Under the U.S./RoW Agreement, AstraZeneca will pay for all commercialization costs in the U.S. and RoW and AstraZeneca will be responsible for the U.S. commercialization of roxadustat, with FibroGen undertaking specified promotional activities in the end-stage renal disease segment in the U.S. In addition, we will receive a transfer price for delivery of commercial product based on a percentage of net sales in the low- to mid-single digit range and AstraZeneca will pay us a tiered royalty on net sales of roxadustat in the low 20% range.

Under the China Agreement, which is conducted through FibroGen China Anemia Holdings, Ltd. ("FibroGen China"), the commercial collaboration is structured as a 50/50 profit share. AstraZeneca will conduct commercialization activities in China as well as serve as the master distributor for roxadustat and fund roxadustat launch costs in China until FibroGen Beijing has achieved profitability. At that time, AstraZeneca will recoup 50% of their historical launch costs out of initial roxadustat profits in China.

Payments under these agreements include over \$500.0 million in upfront, non-contingent and other payments received or expected to be received prior to the first U.S. approval, excluding development expense reimbursement.

AstraZeneca may terminate the U.S./RoW Agreement upon specified events, including our bankruptcy or insolvency, our uncured material breach, technical product failure, or upon 180 days prior written notice at will. If AstraZeneca terminates the U.S./RoW Agreement at will, in addition to any unpaid non-contingent payments, it will be responsible for paying for a substantial portion of the post-termination development costs under the agreed development plan until regulatory approval.

AstraZeneca may terminate the China Agreement upon specified events, including our bankruptcy or insolvency, our uncured material breach, technical product failure, or upon advance prior written notice at will. If AstraZeneca terminates our China Agreement at will, it will be responsible for paying for transition costs as well as make a specified payment to FibroGen China.

In the event of any termination of the agreements, but subject to modification upon termination for technical product failure, AstraZeneca will transfer and assign to us any regulatory filings and approvals for roxadustat in the affected territories that they may hold under our agreements, grant us licenses and conduct certain transition activities.

As mentioned above, during the second quarter of 2019, we received positive topline results from analyses of pooled MACE and MACE+ data from its Phase 3 trials for roxadustat, enabling our NDA submission to the FDA, which is anticipated in the third quarter of 2019. We evaluated the regulatory milestone payment associated with this planned NDA submission and concluded that this milestone became probable of being achieved in the second quarter of 2019. Accordingly, the consideration of \$50.0 million associated with this milestone was included in the transaction price and allocated to performance obligations under the U.S./ RoW Agreement in the second quarter of 2019.

Additional Information Related to Collaboration Agreements

Total cash consideration received through June 30, 2019 and potential cash consideration, other than development cost reimbursement, transfer price payments, royalties and profit share, pursuant to our existing collaboration agreements are as follows:

		Cash Received Through June 30,2019		Additional Potential Cash Payments (in thousands)	Total Potential Cash Payments		
Astellasrelated-party:							
Japan Agreement		77,593	\$	95,000	\$	172,593	
Europe Agreement		410,000		335,000		745,000	
Total Astellas		487,593		430,000		917,593	
AstraZeneca:							
U.S. / RoW Agreement		389,000		860,000		1,249,000	
China Agreement		55,200		321,500		376,700	
Total AstraZeneca		444,200		1,181,500		1,625,700	
Total revenue	\$ 9		\$	1,611,500	\$	2,543,293	

These collaboration agreements also provide for reimbursement of certain fully burdened research and development costs as well as direct out of pocket expenses.

RESULTS OF OPERATIONS

Revenue

	Three Mor	nths Ended	Six Months Ended								
	June	June 30,		nge	June	e 30,	Change				
	2019	2019 2018		%	2019	2018	\$	%			
	·			(dollars in thousands)							
Revenue:											
License revenue	\$ 150,581	\$ 14,323	\$ 136,258	951 %	\$ 150,581	\$ 14,323	\$ 136,258	951 %			
Development and other revenue	40,985	29,629	11,356	38 %	64,848	61,553	3,295	5 %			
Total revenue	\$ 191,566	\$ 43,952	\$ 147,614	336 %	\$ 215,429	\$ 75,876	\$ 139,553	184 %			

Our revenue to date has been generated substantially from our collaboration agreements with Astellas and AstraZeneca.

Under our revenue recognition policy, license revenue includes amounts from upfront, non-refundable license payments and amounts allocated pursuant to the standalone selling price method from other consideration received during the periods. This revenue is generally recognized as deliverables are met and services are performed.

Development revenue include co-development and other development related services. Co-development services are recognized as revenue in the period in which they are billed to our partners, excluding China. For China co-development services, revenue is deferred until the end of the development period once all performance obligations have been satisfied. Other development related services are recognized as revenue over the non-contingent development period, ranging from 36 to 89 months, based on a proportional performance method. Other revenues consist of sales of research and development material and have been included with Development and other revenue in the condensed consolidated statements of operations, as they have not been material for any of the periods presented.

PART II-OTHER INFORMATION

ITEM 1, LEGAL PROCEEDINGS

We are not currently a party to any material legal proceedings.

ITEM 1A. RISK FACTORS

Investing in our common stock involves a high degree of risk. You should carefully consider the risks described below in addition to the other information included or incorporated by reference in this Quarterly Report on Form 10-Q, including our condensed consolidated financial statements and the related notes and "Management's Discussion and Analysis of Financial Condition and Results of Operations," before deciding whether to invest in our common stock. The occurrence of any of the events or developments described below could harm our business, financial condition, results of operations and growth prospects. In such an event, the market price of our common stock could decline, and you may lose all or part of your investment. Although we have discussed all known material risks, the risks described below are not the only ones that we may face. Additional risks and uncertainties not presently known to us or that we currently deem immaterial may also impair our business operations.

We have marked with an asterisk (*) those risks described below that reflect substantive changes from the risks described under Part I, Item 1A "Risk Factors" included in our Annual Report on Form 10-K for the year ended December 31, 2018.

Risks Related to Our Financial Condition and History of Operating Losses

We have incurred significant losses since our inception and anticipate that we will continue to incur losses for the foreseeable future and may never achieve or sustain profitability. We may require additional financings in order to fund our operations.*

We are a clinical-stage biopharmaceutical company with two lead product candidates in clinical development, roxadustat in anemia in chronic kidney disease ("CKD") and myelodysplastic syndromes ("MDS"), and pamrevlumab (FG-3019) in idiopathic pulmonary fibrosis ("IPF"), pancreatic cancer and Duchenne muscular dystrophy ("DMD"). Pharmaceutical product development is a highly risky undertaking. To date, we have focused our efforts and most of our resources on hypoxia-inducible factor ("HIF") and fibrosis biology research, as well as developing our lead product candidates. We are not profitable and, other than in 2006 and 2007 due to income received from our Astellas Pharma Inc. ("Astellas") collaboration, have incurred annual losses each year since our inception. We have not generated any revenue based on commercial drug product sales to date. We continue to incur significant research and development and other expenses related to our ongoing operations. Our net loss for the year ended December 31, 2018 was approximately \$86.4 million, and our net loss for the years ended December 31, 2017, and 2016, recast from amounts previously reported due to the adoption of the new revenue standards, were approximately \$120.9 million and \$58.1 million, respectively. As of June 30, 2019, we had an accumulated deficit of \$637.2 million. As of June 30, 2019, we had capital resources consisting of cash, cash equivalents and short-term investments of \$660.8 million plus \$10.9 million of long-term investments classified as available for sale securities. Despite contractual development and cost coverage commitments from our collaboration partners, AstraZeneca AB ("AstraZeneca") and Astellas, and the potential to receive milestone and other payments from these partners, and despite our expectation to launch commercialization efforts in China for roxadustat for the treatment of anemia caused by CKD in dialysis patients, we anticipate we will continue to incur losses for the foreseeable future, and we anticipate these losses will increase as we continue our development of and seek regulatory approval for our product candidates and in our commercialization efforts. If we do not successfully develop and obtain regulatory approval for our existing or any future product candidates and effectively manufacture, market and sell any product candidates that are approved, we may never generate product sales, and even if we do generate product sales, we may never achieve or sustain profitability on a quarterly or annual basis. Our prior losses, combined with expected future losses, have had and will continue to have an adverse effect on our stockholders' equity and working capital. Our failure to become and remain profitable would depress the market price of our common stock and could impair our ability to raise capital, expand our business, diversify our product offerings or continue our operations.

We believe that we will continue to expend substantial resources for the foreseeable future as we continue late-stage clinical development of roxadustat, grow our operations in the People's Republic of China ("China"), expand our clinical development efforts on pamrevlumab, seek regulatory approval, prepare for the commercialization of our product candidates, and pursue additional indications. These expenditures will include costs associated with research and development, conducting preclinical trials and clinical trials, obtaining regulatory approvals in various jurisdictions, and manufacturing and supplying products and product candidates for ourselves and our partners. In particular, in our planned Phase 3 clinical trial program for roxadustat, which we believe will be the largest Phase 3 program ever conducted for an anemia product candidate, we are expecting to enroll more than 8,000 patients for our United States ("U.S.") and European programs alone. We are conducting this Phase 3 program in conjunction with Astellas and AstraZeneca, and we are substantially dependent on Astellas and AstraZeneca for the funding of this large program. The outcome of any clinical trial and/or regulatory approval process is highly uncertain and we are unable to fully estimate the actual costs necessary to successfully complete the development and regulatory approval process for our compounds in development and any future product candidates. We believe that the net proceeds from our 2017 public offerings, our existing cash and cash equivalents, short-term and longterm investments and accounts receivable, and expected third party collaboration revenues will allow us to fund our operating plans through at least the next 12 months. Our operating plans or third party collaborations may change as a result of many factors, which are discussed in more detail below, and other factors that may not currently be known to us, and we therefore may need to seek additional funds sooner than planned, through offerings of public or private securities, debt financings or other sources, such as royalty monetization or other structured financings. Such financings may result in dilution to stockholders, imposition of debt covenants and repayment obligations, or other restrictions that may adversely affect our business. We may also seek additional capital due to favorable market conditions or strategic considerations even if we currently believe that we have sufficient funds for our current or future operating plans.

Our future funding requirements will depend on many factors, including, but not limited to:

- the rate of progress in the development of our product candidates;
- the costs of development efforts for our product candidates, such as pamrevlumab, that are not subject to reimbursement from our collaboration partners;
- the costs necessary to obtain regulatory approvals, if any, for our product candidates in the U.S., China and other jurisdictions, and
 the costs of post-marketing studies that could be required by regulatory authorities in jurisdictions where approval is obtained;
- the continuation of our existing collaborations and entry into new collaborations;
- the time and unreimbursed costs necessary to commercialize products in territories in which our product candidates are approved for sale:
- the revenues from any future sales of our products as well as revenue earned from profit share, royalties and milestones;
- the level of reimbursement or third party payor pricing available to our products;
- the costs of establishing and maintaining manufacturing operations and obtaining third party commercial supplies of our products, if any, manufactured in accordance with regulatory requirements;
- · the costs we incur in maintaining domestic and foreign operations, including operations in China;
- regulatory compliance costs;
- · the costs of our commercialization efforts for roxadustat for the treatment of anemia caused by CKD in dialysis patients in China; and
- the costs we incur in the filing, prosecution, maintenance and defense of our extensive patent portfolio and other intellectual property rights.

Additional funds may not be available when we require them, or on terms that are acceptable to us. If adequate funds are not available to us on a timely basis, we may be required to delay, limit, reduce or terminate our research and development efforts or other operations or activities that may be necessary to commercialize our product candidates.

Table of Contents

All of our recent revenue has been earned from collaboration partners for our product candidates under development.

Substantially all of our revenues recognized in recent years have been from our collaboration partners.

We will require substantial additional capital to achieve our development and commercialization goals, which for our lead product candidate, roxadustat, is currently contemplated to be provided under our existing third party collaborations with Astellas and AstraZeneca.

If either or both of these collaborations were to be terminated, we could require significant additional capital in order to proceed with development and commercialization of our product candidates, including with respect to our expected commercialization for roxadustat for the treatment of anemia caused by CKD in dialysis patients in China, or we may require additional partnering in order to help fund such development and commercialization. If adequate funds or partners are not available to us on a timely basis or on favorable terms, we may be required to delay, limit, reduce or terminate our research and development efforts or other operations.

If we are unable to continue to progress our development efforts and achieve milestones under our collaboration agreements, our revenues may decrease and our activities may fail to lead to commercial products.

Substantially all of our revenues to date have been, and a significant portion of our future revenues are expected to be, derived from our existing collaboration agreements. Revenues from research and development collaborations depend upon continuation of the collaborations, reimbursement of development costs, the achievement of milestones and royalties and profits from our product sales, if any, derived from future products developed from our research. If we are unable to successfully advance the development of our product candidates or achieve milestones, revenues under our collaboration agreements will be substantially less than expected.

Risks Related to the Development and Commercialization of Our Product Candidates

We are substantially dependent on the success of our lead product candidate, roxadustat, and our second compound in development, pamreylumab.*

To date, we have invested a substantial portion of our efforts and financial resources in the research and development of roxadustat and pamrevlumab. While we have received approval of our New Drug Application ("NDA") for roxadustat in China for CKD anemia in dialysis patients, we will need to make substantial additional investments in both the development and commercialization of roxadustat worldwide and in various indications. Our near-term prospects, including maintaining our existing collaborations with Astellas and AstraZeneca, will depend heavily on successful development and commercialization of roxadustat, including obtaining regulatory approvals for the commercialization of roxadustat for anemia associated with CKD in the U.S., Europe, and Japan.

Our other lead product candidate, pamrevlumab, is currently in clinical development for IPF, pancreatic cancer and DMD. Pamrevlumab requires substantial further development and investment. We do not have a collaboration partner for support of this compound, and, while we have promising open-label safety data and potential signals of efficacy, we would need to complete larger and more extensive controlled clinical trials to validate the results to date in order to continue further development of this product candidate. In addition, although there are many potentially promising indications beyond IPF, pancreatic cancer and DMD, we are still exploring indications for which further development of, and investment for, pamrevlumab may be appropriate. Accordingly, the costs and time to complete development and related risks are currently unknown. Moreover, pamrevlumab is a monoclonal antibody, which may require experience and expertise that we may not currently possess as well as financial resources that are potentially greater than those required for our small molecule lead compound, roxadustat.

The clinical and commercial success of roxadustat and pamrevlumab will depend on a number of factors, many of which are beyond our control, and we may be unable to complete the development or commercialization of roxadustat or pamrevlumab.*

The clinical and commercial success of roxadustat and pamrevlumab will depend on a number of factors, including the following:

- the timely completion of data analyses from our Phase 3 clinical trials for roxadustat, which will depend substantially upon requirements for such trials imposed by the U.S. Food and Drug Administration ("FDA") and other regulatory agencies and bodies and the continued commitment and coordinated and timely performance by our third party collaboration partners, AstraZeneca and Astellas;
- the timely initiation and completion of our clinical trials for pamrevlumab, including in IPF, pancreatic cancer and DMD;
- our ability to demonstrate the safety and efficacy of our product candidates to the satisfaction of the relevant regulatory authorities;

- the ultimate approval criteria (which may include non-inferiority margins and statistical analyses methods), indications, patient populations, and ultimate benefit-risk analysis used by regulatory authorities in their approval processes;
- whether we are required by the FDA or other regulatory authorities to conduct additional clinical trials, and the scope and nature of such clinical trials, prior to approval to market our products;
- the timely receipt of necessary marketing approvals from the FDA and foreign regulatory authorities, including pricing and reimbursement determinations:
- the ability to successfully commercialize our product candidates, if approved, for marketing and sale by the FDA or foreign regulatory authorities, whether alone or in collaboration with others;
- our ability and the ability of our third party manufacturing partners to manufacture quantities of our product candidates at quality levels necessary to meet regulatory requirements and at a scale sufficient to meet anticipated demand at a cost that allows us to achieve profitability;
- our success in educating health care providers and patients about the benefits, risks, administration and use of our product candidates, if approved;
- acceptance of our product candidates, if approved, as safe and effective by patients and the healthcare community;
- the success of efforts to enter into relationships with large dialysis organizations involving the administration of roxadustat to dialysis patients;
- the achievement and maintenance of compliance with all regulatory requirements applicable to our product candidates;
- the maintenance of an acceptable safety profile of our products following any approval;
- the availability, perceived advantages, relative cost, relative safety, and relative efficacy of alternative and competitive treatments;
- our ability to obtain and sustain an adequate level of pricing or reimbursement for our products by third party payors;
- our ability to enforce successfully our intellectual property rights for our product candidates and against the products of potential competitors; and
- our ability to avoid or succeed in third party patent interference or patent infringement claims.

Many of these factors are beyond our control. Accordingly, we cannot assure you that we will ever be able to achieve profitability through the sale of, or royalties from, our product candidates. If we or our collaboration partners are not successful in obtaining approval for and commercializing our product candidates, or are delayed in completing those efforts, our business and operations would be adversely affected.

If our commercialization efforts for roxadustat in China are unsuccessful, our business, financial condition and results of operations will be materially harmed.

We have invested and continue to invest a significant portion of our efforts and financial resources in the development, approval and now commercialization of roxadustat for the treatment of anemia caused by CKD in dialysis patients in China, as well as in other indications and other geographic regions. With the marketing authorization received from the National Medical Products Administration ("NMPA") of roxadustat for the treatment of anemia caused by CKD in dialysis patients in China, we plan to launch commercialization efforts in China in the third quarter of 2019 with our commercialization partner AstraZeneca.

Our success of commercialization of roxadustat in China will depend on numerous factors in China, including:

- · our success in the marketing, sales, and distribution of the product along with our collaboration partner AstraZeneca;
- our success in negotiating a cost effective reimbursed price with the government in China;
- acceptance of roxadustat by state-owned and state-controlled hospitals, physicians, patients and the healthcare community;
- acceptance of pricing and placement of roxadustat on China's Medical Insurance Catalogs. Refer to "Business Government Regulation - Regulation in China";
- successfully establishing and maintaining commercial manufacturing with third parties;

Table of Contents

- successfully manufacturing our drug substances and drug products through our subsidiary FibroGen (China) Medical Technology Development Co., Ltd. ("FibroGen Beijing");
- receiving market authorization for roxadustat for anemia caused by CKD in non-dialysis patients;
- our success in arranging for and passing the inspection of our clinical sites by the NMPA;
- whether AstraZeneca is able to recruit and retain adequate numbers of effective sales and marketing personnel for the sale of roxadustat;
- whether we can compete successfully as a new entrant in the treatment of anemia caused by CKD in dialysis patients in China; and
- whether we will maintain sufficient funding to cover the costs and expenses associated with creating and sustaining a capable sales and marketing organization and related commercial infrastructure.

Successful commercialization of roxadustat will require significant resources and time, and there is a risk that we may not successfully commercialize roxadustat. If we do not achieve one or more of these factors in a timely manner or at all, we could experience significant delays or an inability to successfully commercialize roxadustat and generate revenues, which would deprive us from additional working capital and would materially harm our business. If we do not successfully commercialize roxadustat in China, our collaboration partners and third parties may also lose confidence in our ability to execute in commercialization efforts and become less likely to collaborate with us, and our business may be harmed.

As a Company, we have no commercialization experience, and the time and resources to develop such experience are significant. If we fail to achieve and sustain commercial success for roxadustat in China, either directly or with AstraZeneca, our business would be harmed.

Commercializing roxadustat in China with AstraZeneca will require us to establish commercialization systems, including but not limited to, medical affairs, sales, pharmacovigilance, supply-chain, and distribution capabilities to perform our portion of the collaborative efforts. These efforts will require resources and time. In particular, significant resources may be necessary to successfully market, sell and distribute roxadustat to patients with anemia caused by CKD in dialysis patients. If we, along with AstraZeneca, are not successful in setting our marketing, pricing and reimbursement strategy, facilitating adoption by hospitals in China, recruiting sales and marketing personnel or in building a sales and marketing infrastructure, we will have difficulty commercializing roxadustat, which would adversely affect our business and financial condition.

As we evolve from a company primarily involved in research and development to a company potentially involved in commercialization, we may encounter difficulties in managing our growth and expanding our operations successfully.

If we are successful in advancing roxadustat and our other product candidates through the development stage towards commercialization, we will need to expand our organization, including adding marketing and sales capabilities or continuing to contract with third parties to provide these capabilities for us. As our operations expand, we expect that we will also need to manage our existing and additional relationships with various collaborative partners, suppliers and other third parties. Future growth will impose significant added responsibilities on our organization, in particular on management. Our future financial performance and our ability to commercialize roxadustat and our other product candidates and to compete effectively will depend, in part, on our ability to manage any future growth effectively. To that end, we may not be able to manage our growth efforts effectively, and hire, train and integrate additional management, administrative and sales and marketing personnel, and our failure to accomplish any of these activities could prevent us from successfully growing our Company.

Although FibroGen Beijing obtained regulatory approval for roxadustat in China in December 2018, we may be unable to obtain regulatory approval for our product candidates in other countries, or such approval may be delayed or limited, due to a number of factors, many of which are beyond our control.

The clinical trials and the manufacturing of our product candidates are and will continue to be, and the marketing of our product candidates will be, subject to extensive and rigorous review and regulation by numerous government authorities in the U.S. and in other countries where we intend to develop and, if approved, market any product candidates. Before obtaining regulatory approval for the commercial sale of any product candidate, we must demonstrate through extensive preclinical trials and clinical trials that the product candidate is safe and effective for use in each indication for which approval is sought. The regulatory review and approval process is expensive and requires substantial resources and time, and in general very few product candidates that enter development receive regulatory approval. In addition, our collaboration partners for roxadustat have final control over development decisions in their respective territories and they may make decisions with respect to development or regulatory authorities that delay or limit the potential approval of roxadustat, or increase the cost of development or commercialization. Accordingly, we may be unable to successfully develop or commercialize roxadustat or pamerelumab or any of our other product candidates.

Even though FibroGen Beijing obtained regulatory approval for roxadustat in China, we have not obtained regulatory approval for any of our product candidates in other countries and it is possible that roxadustat and pamrevlumab will never receive regulatory approval in other countries. Other regulatory authorities may take actions or impose requirements that delay, limit or deny approval of roxadustat or pamrevlumab for many reasons, including, among others:

- our failure to adequately demonstrate to the satisfaction of regulatory authorities that roxadustat is safe and effective in treating anemia in CKD or that pamrevlumab is safe and effective in treating IPF, pancreatic cancer or DMD;
- our failure to demonstrate that a product candidate's clinical and other benefits outweigh its safety risks;
- the determination by regulatory authorities that additional clinical trials are necessary to demonstrate the safety and efficacy of roxadustat or pamrevlumab, or that ongoing clinical trials need to be modified in design, size, conduct or implementation;
- our product candidates may exhibit an unacceptable safety signal as they advance through clinical trials, in particular controlled Phase 3 trials;
- the clinical research organizations ("CROs") that conduct clinical trials on our behalf may take actions outside of our control that materially adversely impact our clinical trials;
- we or third party contractors manufacturing our product candidates may not maintain current good manufacturing practices ("cGMP"), successfully pass inspection or meet other applicable manufacturing regulatory requirements;
- regulatory authorities may not agree with our interpretation of the data from our preclinical trials and clinical trials;
- · collaboration partners may not perform or complete their clinical programs in a timely manner, or at all; or
- principal investigators may determine that one or more serious adverse events ("SAEs"), is related or possibly related to roxadustat, and any such determination may adversely affect our ability to obtain regulatory approval, whether or not the determination is correct.

Any of these factors, many of which are beyond our control, could jeopardize our or our collaboration partners' abilities to obtain regulatory approval for and successfully market roxadustat. Because our business and operations in the near-term are almost entirely dependent upon roxadustat, any significant delays or impediments to regulatory approval could have a material adverse effect on our business and prospects.

In China, the NMPA required that FibroGen Beijing conduct three clinical studies as a post-approval commitment: (i) a post-approval safety study in 2,000 patients; (ii) a drug-intensive monitoring study in 1,000 patients; and (iii) a dosing optimization study in approximately 300 patients on dialysis. Furthermore, in the U.S., we also expect to be required to perform additional clinical trials in order to obtain approval or as a condition to maintaining approval due to post-marketing requirements. If the FDA requires a risk evaluation and mitigation strategy ("REMS"), for any of our product candidates if approved, the substantial cost and expense of complying with a REMS or other post-marketing requirements may limit our ability to successfully commercialize our product candidates.

Table of Contents

Preclinical, Phase 1 and Phase 2 clinical trial results may not be indicative of the results that may be obtained in larger, controlled Phase 3 clinical trials required for approval.*

Clinical development is expensive and can take many years to complete, and its outcome is inherently uncertain. Failure can occur at any time during the clinical trial process. Success in preclinical and early clinical trials, which are often highly variable and use small sample sizes, may not be predictive of similar results in humans or in larger, controlled clinical trials, and successful results from early or small clinical trials may not be replicated or show as favorable an outcome, even if successful.

We have conducted a limited number of Phase 2 clinical trials with pamrevlumab. We have conducted a randomized placebo-controlled study in 103 IPF patients with sub-studies in an additional 57 IPF patients comparing pamrevlumab to one of two standards of care, an open-label Phase 2 dose escalation study of pamrevlumab for IPF in 89 patients and a randomized double-blind placebo controlled study for liver fibrosis in subjects with hepatitis B, we are currently conducting an open-label randomized, active-control, neoadjuvant Phase 2 trial in pancreatic cancer combining pamrevlumab with nab-paclitaxel plus gemcitabine in 37 patients, and we are currently in a Phase 2 open-label trial of pamrevlumab for DMD in 21 non-ambulatory patients. We cannot be sure that the results we have received to date from these trials will be substantiated in larger, well-controlled Phase 3 clinical trials, that larger trials will demonstrate the safety and efficacy of pamrevlumab for these or other indications, that further studies will provide benefits over existing approved products or that new safety issues will not be uncovered in further trials. In addition, while we believe that the limited animal and human studies conducted to date suggest that pamrevlumab has the potential to arrest or reverse fibrosis and reduce tumor mass in some patients or diseases, we cannot be sure that these results will be indicative of the effects of pamrevlumab in larger human trials. In addition, the IPF and pancreatic cancer patient populations are extremely ill and routinely experience SAEs, including death, which may be attributed to pamrevlumab in a manner that negatively impacts the safety profile of our product candidate. If the additional clinical trials that we are planning or are currently conducting for pamrevlumab do not show favorable efficacy results or result in safety concerns, or if we do not meet our clinical endpoints with statistical significance, or demonstrate an acceptable risk-benefit profile, we may be prevented from or delay

In the past we developed an earlier generation product candidate aimed at treating anemia in CKD that resulted in a clinical hold for a safety signal seen in that product in Phase 2 clinical trials. The clinical hold applied to that product candidate and roxadustat was lifted for both product candidates after submission of the requested information to the FDA. While we have not seen similar safety concerns involving roxadustat to date, some of the safety concerns associated with the treatment of patients with anemia in CKD using erythropoiesis stimulating agents ("ESAs") did not emerge for many years until placebo-controlled studies had been conducted in large numbers of patients. And while the data monitoring committee for our U.S. and Europe Phase 3 anemia trials has consistently determined that our trials should continue without modification to the protocol, safety issues may still be discovered upon review of unblinded major adverse cardiac event ("MACE") or other data. The biochemical pathways that we believe are affected by roxadustat are implicated in a variety of biological processes and disease conditions, and it is possible that the use of roxadustat to treat larger numbers of patients will demonstrate unanticipated adverse effects, including possible drug interactions, which may negatively impact the safety profile, use and market acceptance of roxadustat. We studied the potential interaction between roxadustat and three statins (atorvastatin, rosuvastatin and simvastatin), which are used to lower levels of lipids in the blood. An adverse effect associated with increased statin plasma concentration is myopathy, which typically presents in a form of myalgia. The studies indicated the potential for increased exposure to those statins when roxadustat is taken simultaneously with those statins and suggested the need for statin dose reductions for patients receiving higher statin doses. We performed additional clinical pharmacology studies to evaluate if the effect of any such interaction could be minimized or eliminated by a modification of the dosing schedule that would separate the administration of roxadustat and the statin by up to 10 hours, however, such studies showed no minimization of effect. It is possible that the potential for interaction between roxadustat and statins could lead to label provisions for statins or roxadustat relating, for example, to dose scheduling or recommended statin dose limitations. In CKD patients, statin therapy is often initiated earlier than treatment for anemia, and risks of myopathy have been shown to decrease with increased time on drug. While we believe the prior statin treatment history of such patients at established doses may reduce the risk of adverse effects from any interaction with roxadustat and facilitate any appropriate dose adjustments, we cannot be sure that this will be the case.

Our Phase 3 trials include a MACE safety endpoint, which is a composite endpoint designed to identify major safety concerns, in particular relating to cardiovascular events such as cardiovascular death, myocardial infarction and stroke. The European Medicines Agency ("EMA") is requiring MACE+ as a safety endpoint which, in addition to the MACE components, incorporates measurements of hospitalization rates due to heart failure or unstable angina. The EMA will also review MACE results. The FDA has also informed us that the MACE endpoint will need to be evaluated separately for our Phase 3 trials in non-dialysis-dependent ("NDD")-CKD patients and our Phase 3 trials in dialysis-dependent ("DD")-CKD patients. The MACE endpoint is being evaluated in pooled analysis across Phase 3 studies of similar study populations and requires demonstration of non-inferiority relative to comparator, which means that the MACE event rate in roxadustat-treated patients must have less than a specified probability of exceeding the rate in the comparator trial by a specified hazard ratio.

Table of Contents

The number of patients necessary in order to permit a statistical analysis with adequate ability to detect the relative risk of MACE or MACE+ events in different arms of the trial, referred to as statistical power, depends on a number of factors, including the rate at which MACE or MACE+ events occur per patient-year in the trial, treatment duration of the patients, the achieved hazard ratios, the rates of discontinuation, and the required statistical power and confidence intervals.

In addition, we cannot be sure that the potential advantages we believe roxadustat may have for treatment of patients with anemia in CKD, as compared to the use of ESAs, will be substantiated by our larger U.S. and European Phase 3 clinical trials, or that we will be able to include a discussion of such advantages in our labeling should we obtain approval. We believe that roxadustat may have certain benefits as compared to ESAs based on the data from our Phase 2 clinical trials and China Phase 3 trials conducted to date, including safety benefits, the absence of a hypertensive effect, the potential to lower cholesterol levels and the potential to correct anemia without the use of IV iron. However, our belief that roxadustat may offer those benefits is based on a limited amount of data from our clinical trials to date, and our understanding of the likely mechanisms of action for roxadustat. Some of these benefits, such as those associated with the apparent effects on blood pressure and cholesterol, are not fully understood and, even if roxadustat receives marketing approval in additional countries beyond China, we do not expect that it will be approved for the treatment of high blood pressure or high cholesterol based on the data from our Phase 3 trials, and we may not be able to refer to any such benefits in the labeling. While the data from our Phase 2 trials suggests roxadustat may reduce low-density lipoprotein ("LDL"), and reduce the ratio of LDL to high-density lipoprotein ("HDL"), the data show it may also reduce HDL, which may be a risk to patients. In addition, causes of the safety concerns associated with the use of ESAs to achieve specified target hemoglobin levels have not been fully elucidated. While we believe that the issues giving rise to these concerns with ESAs are likely due to factors other than the hemoglobin levels achieved, we cannot be certain that roxadustat will not be associated with similar, or more severe, safety concerns.

Many companies in the pharmaceutical and biotechnology industries have suffered significant setbacks in late-stage clinical trials after achieving positive results in early-stage development, and we may face similar setbacks. In addition, the CKD patient population has many afflictions that may cause severe illness or death, which may be attributed to roxadustat in a manner that negatively impacts the safety profile of our product candidate. The results of our completed Phase 3 clinical trials for roxadustat demonstrated efficacy, as all primary efficacy endpoints were met with statistical significance. While we have reported topline cardiovascular safety results, the analysis of these data is ongoing; there may be unanticipated safety concerns or adverse events that prevent from or delay obtaining marketing approval for roxadustat, and even if we obtain marketing approval, any sales of roxadustat may suffer.

We do not know whether our ongoing or planned clinical trials of roxadustat or pamrevlumab will need to be redesigned based on interim results, be able to achieve sufficient enrollment or be completed on schedule, if at all.*

Clinical trials can be delayed or terminated for a variety of reasons, including delay or failure to:

- address any physician or patient safety concerns that arise during the course of the trial;
- · obtain required regulatory or institutional review board ("IRB") approval or guidance;
- reach timely agreement on acceptable terms with prospective CROs and clinical trial sites;
- recruit, enroll and retain patients through the completion of the trial;
- maintain clinical sites in compliance with clinical trial protocols;
- initiate or add a sufficient number of clinical trial sites; and
- manufacture sufficient quantities of product candidate for use in clinical trials.

In addition, we could encounter delays if a clinical trial is suspended or terminated by us, by the relevant IRBs at the sites at which such trials are being conducted, or by the FDA or other regulatory authorities. A suspension or termination of clinical trials may result from any number of factors, including failure to conduct the clinical trial in accordance with regulatory requirements or our clinical protocols, inspection of the clinical trial operations or trial site by the FDA or other regulatory authorities resulting in the imposition of a clinical hold, unforeseen safety issues or adverse side effects, changes in laws or regulations, or a principal investigator's determination that a serious adverse event could be related to our product candidates. Any delays in completing our clinical trials will increase the costs of the trial, delay the product candidate development and approval process and jeopardize our ability to commence marketing and generate revenues. Any of these occurrences may materially and adversely harm our business and operations and prospects.

Our product candidates may cause or have attributed to them undesirable side effects or have other properties that delay or prevent their regulatory approval or limit their commercial potential.

Undesirable side effects caused by our product candidates or that may be identified as related to our product candidates by physician investigators conducting our clinical trials or even competing products in development that utilize a similar mechanism of action or act through a similar biological disease pathway could cause us or regulatory authorities to interrupt, delay or halt clinical trials and could result in the delay or denial of regulatory approval by the FDA or other regulatory authorities and potential product liability claims. Adverse events and SAEs that emerge during treatment with our product candidates or other compounds acting through similar biological pathways may be deemed to be related to our product candidate and may result in:

- our Phase 3 clinical trial development plan becoming longer and more extensive;
- regulatory authorities increasing the data and information required to approve our product candidates and imposing other requirements; and
- our collaboration partners terminating our existing agreements.

The occurrence of any or all of these events may cause the development of our product candidates to be delayed or terminated, which could materially and adversely affect our business and prospects. Refer to "Business - Our Development Program for Roxadustat" and "Business - Pamrevlumab for the Treatment of Fibrosis and Cancer" for a discussion of the adverse events and SAEs that have emerged in clinical trials of roxadustat and pamrevlumab.

Clinical trials of our product candidates may not uncover all possible adverse effects that patients may experience.

Clinical trials are conducted in representative samples of the potential patient population, which may have significant variability. Clinical trials are by design based on a limited number of subjects and of limited duration for exposure to the product used to determine whether, on a potentially statistically significant basis, the planned safety and efficacy of any product candidate can be achieved. As with the results of any statistical sampling, we cannot be sure that all side effects of our product candidates may be uncovered, and it may be the case that only with a significantly larger number of patients exposed to the product candidate for a longer duration, that a more complete safety profile is identified. Further, even larger clinical trials may not identify rare serious adverse effects or the duration of such studies may not be sufficient to identify when those events may occur. There have been other products, including ESAs, for which safety concerns have been uncovered following approval by regulatory authorities. Such safety concerns have led to labeling changes or withdrawal of ESAs products from the market. While our most advanced product candidate is chemically unique from ESAs, it or any of our product candidates may be subject to similar risks. For example, roxadustat for use in anemia in CKD is being developed to address a very diverse patient population expected to have many serious health conditions at the time of administration of roxadustat, including diabetes, high blood pressure and declining kidney function.

To date we have not seen evidence of significant safety concerns with our product candidates currently in clinical trials. Patients treated with our products, if approved, may experience adverse reactions and it is possible that the FDA or other regulatory authorities may ask for additional safety data as a condition of, or in connection with, our efforts to obtain approval of our product candidates. If safety problems occur or are identified after our product candidates reach the market, we may, or regulatory authorities may require us to amend the labeling of our products, recall our products or even withdraw approval for our products.

We may fail to enroll a sufficient number of patients in our clinical trials in a timely manner, which could delay or prevent clinical trials of our product candidates.

Identifying and qualifying patients to participate in clinical trials of our product candidates is critical to our success. The timing of our clinical trials depends on the rate at which we can recruit and enroll patients in testing our product candidates. Patients may be unwilling to participate in clinical trials of our product candidates for a variety of reasons, some of which may be beyond our control:

- severity of the disease under investigation;
- availability of alternative treatments;
- size and nature of the patient population;
- · eligibility criteria for and design of the study in question;
- perceived risks and benefits of the product candidate under study;
- · ongoing clinical trials of competitive agents;

Table of Contents

- physicians' and patients' perceptions of the potential advantages of our product candidates being studied in relation to available therapies or other products under development;
- our CRO's and our trial sites' efforts to facilitate timely enrollment in clinical trials;
- patient referral practices of physicians; and
- ability to monitor patients and collect patient data adequately during and after treatment.

Patients may be unwilling to participate in our clinical trials for roxadustat due to adverse events observed in other drug treatments of anemia in CKD, and patients currently controlling their disease with existing ESAs may be reluctant to participate in a clinical trial with an investigational drug. We may not be able to successfully initiate or continue clinical trials if we cannot rapidly enroll a sufficient number of eligible patients to participate in the clinical trials required by regulatory agencies. If we have difficulty enrolling a sufficient number of patients to conduct our clinical trials as planned, we may need to delay, limit or terminate on-going or planned clinical trials, any of which could have a material and adverse effect on our business and prospects.

If we or third party manufacturers and other service providers on which we rely cannot manufacture sufficient quantities of our product candidates, or at sufficient quality, or perform other services we require, we may experience delays in development, regulatory approval, launch or commercialization.

Completion of our clinical trials and commercialization of our product candidates require access to, or development of, facilities to manufacture and manage our product candidates at sufficient yields and at commercial scale. Although we have entered into commercial supply agreements for the manufacture of some of our raw materials, we have not yet entered into commercial supply agreements with all of our third-party manufacturers. We are continuing to negotiate and expect to enter into commercial supply agreements and other supply management agreements with third-party manufacturers, but we may not be able to enter into these agreements with satisfactory terms or on a timely manner.

We have limited experience manufacturing or managing third parties in manufacturing any of our product candidates in the volumes that are expected to be necessary to support large-scale clinical trials and sales. In addition, we have limited experience forecasting supply requirements or coordinating supply chain (including export management) for launch or commercialization, which is a complex process involving our third-party manufacturers and logistics providers, and for roxadustat, our collaboration partners. We may not be able to accurately forecast supplies for commercial launch, or do so in a timely manner and our efforts to establish these manufacturing and supply chain management capabilities may not meet our requirements as to quantities, scale-up, yield, cost, potency or quality in compliance with cGMP.

We have a limited amount of roxadustat and pamrevlumab in storage, limited capacity reserved at our third-party manufactures, and there are long lead times required to manufacture and scale-up the manufacture of additional supply, as required for both late-stage clinical trials, post-approval trials, and commercial supply. If we are unable to forecast, order or manufacture sufficient quantities of roxadustat or pamrevlumab on a timely basis, it may delay our development, launch or commercialization in some or all indications we are currently pursuing. For example, prior to agreement with regulatory authorities on the scope of our Phase 3 IPF trial design, there is uncertainty as to whether our supply plans will meet our clinical requirements in a timely manner. Any delay or interruption in the supply of our product candidates or products could have a material adverse effect on our business and operations.

Our clinical trials must be conducted with product produced under applicable cGMP regulations. Failure to comply with these regulations may require us to repeat clinical trials, which would delay the regulatory approval process. We, and even an experienced third party manufacturer, may encounter difficulties in production. Difficulties may include:

- costs and challenges associated with scale-up and attaining sufficient manufacturing yields, in particular for biologic products such as pamrevlumab, which is a monoclonal antibody;
- supply chain issues, including coordination of multiple contractors in our supply chain and securing necessary licenses (such as export licenses);
- the timely availability and shelf life requirements of raw materials and supplies;
- · quality control and quality assurance;
- shortages of qualified personnel and capital required to manufacture large quantities of product;

Table of Contents

- compliance with regulatory requirements that vary in each country where a product might be sold;
- · capacity or forecasting limitations and scheduling availability in contracted facilities; and
- natural disasters, such as floods, storms, earthquakes, tsunamis, and droughts, or accidents such as fire, that affect facilities, possibly limit or postpone production, and increase costs.

The FDA and EMA will do their own benefit risk analysis and may reach a different conclusion than we or our partners have internally, and these regulatory authorities may base their approval decision on different analyses, data, and statistical methods than ours.*

Even if we believe we have achieved certain results based on a totality of the evidence, such as superiority or non-inferiority, in certain endpoints, populations or subpopulations, or using certain statistical methods of analysis, the FDA and EMA will each conduct their own benefit-risk analysis and may reach different conclusions, using different statistical methods, different endpoints or definitions thereof, or different patient populations or sub-populations, and regulatory authorities may change their approvability criteria based on their internal analyses and discussions with expert advisors. Regulatory authorities may approve roxadustat for fewer or more limited indications than we request, or may grant approval contingent on the performance of costly post-approval clinical trials. While we will present to regulatory authorities certain pre-specified and not pre-specified sub-populations and sub-group analyses (for example, incident dialysis), multiple secondary endpoints, and multiple analytical methods (such as long-term follow up analyses), including adjusted and censored data, regulatory authorities may reject these analyses, methods, or even parts of our trial design or certain data from our studies, the rationale for our pre-specified non-inferiority margins or other portions of our statistical analysis plans. In addition, even if we are able to provide positive data with respect to certain analyses, such as incident dialysis, estimated glomerular filtration rate, hepcidin, or quality of life measures, regulatory authorities may not include such claims on any approved labeling for roxadustat, which may limit the commercialization or market opportunity for roxadustat. Further, initial topline results reported for certain studies (such as reduction of transfusion risk or hemoglobin response in the presence of inflammation), may not be representative of the data seen in all studies or may not be sustained upon further analyses or after more wide-spread use upon commercialization. The failure to obtain regulatory approval, or any label, population or other approval limitations in any jurisdiction, may significantly limit our ability to generate revenues, and any failure to obtain such approval for all of the indications and labeling claims we deem desirable could reduce our potential revenue.

Positive topline results from our Phase 3 clinical trials assessing the safety and efficacy of roxadustat may not be indicative of additional results or results for roxadustat in other indications.*

There are multiple key and secondary endpoints as well as sub-group analyses in both dialysis and non-dialysis in the U.S. and multiple secondary endpoints in addition to MACE+ as well as sub-group analyses in dialysis and non-dialysis in Europe. We continue to analyze these additional endpoints from the Phase 3 clinical trials of roxadustat in anemia of CKD, as well as from the pooled analyses, some of which may have a bearing on the safety or efficacy of roxadustat. The topline results we have reported thus far may not be indicative of these additional results. In addition, results in these CKD-anemia indications may not be indicative of our clinical trials in other indications or the safety, efficacy, or approvability of roxadustat in other indications.

Even if we are able to obtain regulatory approval of our product candidates, the label we obtain may limit the indicated uses for which our product candidates may be marketed.*

With respect to roxadustat, regulatory approvals, if obtained at all, could limit the approved indicated uses for which roxadustat may be marketed. For example, ESAs have been subject to significant safety warnings, including the "Black Box" warnings on their labels. Refer to "Business - Roxadustat for the Treatment of Anemia in Chronic Kidney Disease - Limitations of the Current Standard of Care for Anemia in CKD" in our annual report on Form 10-K for the year ended December 31, 2018. In addition, in the past, an approved ESA was voluntarily withdrawn due to serious safety issues discovered after approval. The safety concerns relating to ESAs may result in labeling for roxadustat containing similar warnings even if our Phase 3 clinical trials do not suggest that roxadustat has similar safety issues. Even if the label for roxadustat does not contain all of the warnings contained in the "Black Box" warning for ESAs, the label for roxadustat may contain other warnings or limit the market opportunity or approved indications for roxadustat. These warnings could include warnings against exceeding specified hemoglobin targets and other warnings that derive from the lack of clarity regarding the safety issues associated with ESAs, even if our Phase 3 clinical trials do not themselves raise safety concerns.

As an organization, we have not successfully commercialized any drug product. Therefore, we may not be able to efficiently execute our development and commercialization plans.

We are currently conducting Phase 3 clinical trials for pamrevlumab and roxadustat. The conduct of Phase 3 clinical trials and the submission of a successful NDA is a complicated process. As an organization, we have limited experience in preparing, submitting and prosecuting regulatory filings, and have not received approval for an NDA before outside of China where we received marketing authorization in December 2018 from the NMPA for the treatment of anemia caused by CKD in dialysis patients. Consequently, we may be unable to successfully and efficiently execute and complete necessary clinical trials in a way that leads to NDA submission and approval of roxadustat or for any other product candidate we are developing, even if our earlier stage clinical trials are successful. We may require more time and incur greater costs than our competitors and may not succeed in obtaining regulatory approvals of product candidates that we develop. Failure to commence or complete, or delays in, our planned clinical trials would prevent us from or delay us in commercializing roxadustat or any other product candidate we are developing.

In addition, in order for any Phase 3 clinical trial to support an NDA submission for approval, the FDA and foreign regulatory authorities require compliance with regulations and standards, including good clinical practices ("GCP") requirements for designing, conducting, monitoring, recording, analyzing, and reporting the results of clinical trials to ensure that the data and results from trials are credible and accurate and that the rights, integrity and confidentiality of trial participants are protected. Although we rely on third parties to conduct our clinical trials, we as the sponsor remain responsible for ensuring that each of these clinical trials is conducted in accordance with its general investigational plan and protocol under legal and regulatory requirements, including GCP. Regulatory authorities enforce these GCP requirements through periodic inspections of trial sponsors, principal investigators and trial sites. If we or any of our CROs, trial sites, principal investigators or other third parties fail to comply with applicable GCP requirements, the clinical data generated in our clinical trials may be deemed unreliable and the FDA or other regulatory authorities may require us to exclude the use of patient data from our clinical trials not conducted in compliance with GCP or perform additional clinical trials before approving our marketing applications. They may even reject our application for approval or refuse to accept our future applications for an extended time period. For example in China in March 2016, the State Drug Administration, now known as the NMPA issued guidance related to its clinical trial data integrity regulations. While trial sites and CROs bear liability for the accuracy and authenticity of data they are directly responsible for, the sponsor ultimately bears full responsibility for submitted clinical data and the drug application dossier. Fraudulent clinical data could result in a ban in China of a sponsor's product-related NDA applications for three years and other NDA applications for one year. We have taken extensive steps to ensure the integrity of our China clinical data. In China, the clinical site inspections confirmed our compliance with GCP regulations and supported our approval. However, we cannot assure you that upon inspection by a regulatory authority in other regions, such regulatory authority will determine that any of our clinical trials comply with GCP requirements or that our results will be deemed authentic or may be used in support of our regulatory submissions.

If we are unable to establish sales, marketing and distribution capabilities or enter into or maintain agreements with third parties to market and sell our product candidates, we may not be successful in commercializing our product candidates if and when they are approved.

We do not have a sales or marketing infrastructure and have no experience in the sales, marketing or distribution of pharmaceutical products in any country. To achieve commercial success for any product for which we obtain marketing approval, we will need to establish sales and marketing capabilities or make and maintain our existing arrangements with third parties to perform these services at a level sufficient to support our commercialization efforts.

To the extent that we would undertake sales and marketing of any of our products directly, there are risks involved with establishing our own sales, marketing and distribution capabilities. Factors that may inhibit our efforts to commercialize our products on our own include:

- our inability to recruit, train and retain adequate numbers of effective sales and marketing personnel;
- the inability of sales personnel to obtain access to physicians or persuade adequate numbers of physicians to prescribe any future products;
- our inability to effectively manage geographically dispersed sales and marketing teams;
- the lack of complementary products to be offered by sales personnel, which may put us at a competitive disadvantage relative to companies with more extensive product lines; and
- unforeseen costs and expenses associated with creating an independent sales and marketing organization.

Table of Contents

With respect to roxadustat, we are dependent on the commercialization capabilities of our collaboration partners, AstraZeneca and Astellas. If either such partner were to terminate its agreement with us, we would have to commercialize on our own or with another third party. We will have limited or little control over the commercialization efforts of such third parties, and any of them may fail to devote the necessary resources and attention to sell and market our products, if any, effectively. If they are not successful in commercializing our product candidates, our business and financial condition would suffer.

We face substantial competition, which may result in others discovering, developing or commercializing products before, or more successfully, than we do.*

The development and commercialization of new pharmaceutical products is highly competitive. Our future success depends on our ability to achieve and maintain a competitive advantage with respect to the development and commercialization of our product candidates. Our objective is to discover, develop and commercialize new products with superior efficacy, convenience, tolerability, and safety. We expect that in many cases, the products that we commercialize will compete with existing, market-leading products of companies that have large, established commercial organizations.

If roxadustat is approved and launched commercially, competing drugs are expected to include ESAs, particularly in those patient segments where ESAs are used. Currently available ESAs include epoetin alfa (EPOGEN ®, marketed by Amgen Inc. in the U.S., Procrit ® and Erypo ®/Eprex ®, marketed by Johnson & Johnson Inc., and Espo ® marketed by Kyowa Hakko Kirin in Japan and China), darbepoetin (Amgen/Kyowa Hakko Kirin's Aranesp ® and NESP ®) and Mircera ® marketed by Hoffmann-La Roche ("Roche") outside of the U.S. and by Vifor Pharma ("Vifor"), a Roche licensee, in the U.S. and Puerto Rico, as well as biosimilar versions of these currently marketed ESA products. ESAs have been used in the treatment of anemia in CKD for more than 20 years, serving a significant majority of DD-CKD patients. While NDD-CKD patients who are not under the care of nephrologists, including those with diabetes and hypertension, do not typically receive ESAs and are often left untreated, some patients under nephrology care may be receiving ESA therapy. It may be difficult to encourage healthcare providers and patients to switch to roxadustat from products with which they have become familiar.

We may also face competition from potential new anemia therapies currently in clinical development, including in those patient segments not currently addressed by ESAs. Companies such as GlaxoSmithKline plc ("GSK"), Bayer Corporation ("Bayer"), Akebia Therapeutics, Inc. ("Akebia"), and Japan Tobacco, are currently developing HIF prolyl hydroxylase ("HIF-PH") inhibitors for anemia in CKD indications. Akebia is currently conducting Phase 3 studies in NDD-CKD and DD-CKD, as well as additional Phase 1 and Phase 2 studies. In Japan, Mitsubishi Tanabe Pharmaceutical Corporation ("Mitsubishi Tanabe"), Akebia's collaboration partner, submitted an NDA for treatment of anemia in CKD patients on dialysis and not on dialysis, supported by the Phase 3 studies conducted by Mitsubishi Tanabe in Japan. GSK is conducting global Phase 3 studies in NDD-CKD and DD-CKD. In Japan, GSK has completed two Phase 3 studies in hemodialysis-dependent CKD patients and one Phase 3 study in CKD patients not on dialysis or on peritoneal dialysis. GSK and Kyowa Hakko Kirin announced in November 2018 that the two companies signed a strategic commercialization deal in Japan for daprodustat. Bayer has completed global Phase 2 studies and announced in May 2017 its HIF-PH inhibitor is now in continued development in Japan only, and its Japan Phase 3 studies in NDD-CKD and DD-CKD are expected to complete in the second half of 2019. Japan Tobacco is also conducting Phase 3 studies in NDD-CKD and DD-CKD in Japan only. Some of these product candidates may enter the market prior to roxadustat.

In addition, there are other companies developing biologic therapies for the treatment of other anemia indications that we may also seek to pursue in the future, including anemia of MDS. For example, Acceleron Pharma Inc. and its partner Celgene Corporation ("Celgene") announced in April 2019 that Celgene has submitted a Biologics License Application ("BLA") for luspatercept for the treatment of adult patients with very low to intermediate risk of MDS-associated anemia who have ring sideroblasts and require red blood cell transfusions, and beta-thalassemia-associated anemia who require red blood cell transfusions. Celgene's plan to submit a marketing approval application for luspatercept in the European Union ("EU") in the second quarter of 2019. There may also be new therapies for renal-related diseases that could limit the market or level of reimbursement available for roxadustat if and when it is commercialized.

Table of Contents

In China, biosimilars of epoetin alfa are offered by Chinese pharmaceutical companies such as EPIAO marketed by 3SBio Inc. as well as more than 15 other local manufacturers. We may also face competition by HIF-PH inhibitors from other companies such as Akebia, Bayer, and GSK, which was authorized by the NMPA to conduct trials in China to support its ex-China regulatory filings. Furthermore, while it is too early to understand how the NMPA will implement its recently approved guidelines to allow multinational companies to use their ex-China clinical data in their NDAs in China, these guidelines could in theory allow competitors to accelerate their NDA applications in China. Akebia announced in December 2015 that it has entered into a development and commercialization partnership with Mitsubishi Tanabe for its HIF-PH inhibitor vadadustat in Japan, Taiwan, South Korea, India, and certain other countries in Asia, and announced in April 2017 an expansion of their U.S. collaboration with Otsuka to add markets, including China. 3SBio Inc. also announced in 2016 its plan to begin a Phase 1 clinical trial of a HIF-PH inhibitor for the China market, and two Chinese domestic companies, Jiangsu Hengrui Medicine Co., Ltd. and Guangdong Sunshine Health Investment Co., Ltd., have announced they also secured the NMPA approval to conduct clinical trials for their respective HIF-PH inhibitors.

The first biosimilar ESAs, Pfizer's Retacrit® (epoetin zeta), entered the U.S. market in November 2018. Market penetration of Retacrit® (epoetin zeta) and the potential addition of other biosimilar ESAs, currently under development, may alter the competitive and pricing landscape of anemia therapy in DD-CKD patients under the end stage renal disease bundle. The patents for Amgen's epoetin alfa, EPOGEN, expired in 2004 in the EU, and the final material patents in the U.S. expired in May 2015. Several biosimilar versions of currently marketed ESAs are available for sale in the EU, China and other territories. In the U.S., a few ESA biosimilars are currently under development. Sandoz, a division of Novartis, markets Binocrit ® (epoetin alfa) in Europe and may file a biosimilar BLA in the U.S.

The majority of the current CKD anemia market focuses on dialysis patients, who visit dialysis centers on a regular basis, typically three-times a week, and anemia therapies are administered as part of the visit. Two of the largest operators of dialysis clinics in the U.S., DaVita Healthcare Partners Inc. ("DaVita") and Fresenius Medical Care AG & Co. KGaA ("Fresenius"), collectively provide dialysis care to approximately 70% of U.S. dialysis patients, and therefore have historically won long-term contracts including rebate terms with Amgen. In January 2017, DaVita entered into a new 6-year sourcing and supply agreement with Amgen that is effective through 2022. Fresenius' contract with Amgen expired in 2015, and Fresenius is now administering Mircera® in a significant portion of its U.S. dialysis patients since Mircera was made available by Vifor. Successful penetration of this market may require a significant agreement with Fresenius or DaVita on favorable terms and on a timely basis.

If pamrevlumab is approved and launched commercially to treat IPF, competing drugs are expected to include Roche's Esbriet® (pirfenidone) and Boehringer Ingelheim Pharma GmbH & Co. KG's Ofev® (nintedanib). Nintedanib is also in development for non-small cell lung cancer and ovarian cancer. Other potential competitive product candidates in development for IPF include Biogen-Idec's BG-00011, Galapagos NV's GLPG1690 and GLPG1205, Kadmon Holdings, Inc.'s KD025, Prometic Life Sciences Inc.'s PBI-4050, and Promedior Inc.'s PRM-151. Galapagos initiated a Phase 3 study for GLPG 1690 in December 2018.

If pamrevlumab is approved and launched commercially to treat locally advanced pancreatic cancer patients who are not candidates for surgical resection, pamrevlumab may face competition from agents seeking approval in combination with gemcitibine and nab-paclitaxel from companies such as NewLink Genetics Corporation and Halozyme Therapeutics, Inc. Gemcitabine and/or nab-paclitaxel are the current standard of care in the first-line treatment of metastatic pancreatic cancer. Celgene Corporation's Abraxane® (nab-paclitaxel) was launched in the U.S. and Europe in 2013 and 2014, and was the first drug approved in this disease in nearly a decade.

If pamrevlumab is approved and launched commercially to treat DMD, pamrevlumab may face competition for some patients from Sarepta Therapeutics, Inc. ("Sarepta") with Exondys 51® (eteplirsen), approved in the U.S. for patients who have a confirmed mutation in the DMD gene that is amenable to exon 51 skipping, and from PTC Therapeutics' drug ataluren approved in ambulatory patients in Europe. We may also face competition from Sarepta's golodirsen, currently under NDA review in the U.S., and agents currently in development for DMD, including PTC Therapeutics' ataluren, Santhera Pharmaceuticals' idebone, Catabasis Pharmaceuticals' edasalonexent, Capricor Therapeutics' CAP-1002, and Sarepta's casimersen and other gene therapies, if and when these agents are approved and launched.

The success of any or all of these potential competitive products may negatively impact the development and potential for success of pamrevlumab. In addition, any competitive products that are on the market or in development may compete with pamrevlumab for patient recruitment and enrollment for clinical trials or may force us to change our clinical trial design, including, in order to compare pamrevlumab against another drug, which may be the new standard of care.

Table of Contents

If FG-5200 is approved and launched in China to treat corneal blindness resulting from partial thickness corneal damage without active inflammation and infection, it is likely to compete with other products designed to treat corneal damage. For example, in April 2015, a subsidiary of China Regenerative Medicine International Limited received approval for their acellular porcine cornea stroma medical device to treat patients in China with corneal ulcers and in April 2016, Guangzhou Yourvision Biotech Co. Ltd, a subsidiary of Guanhao Biotech, received approval for their acellular porcine cornea medical device to treat patients in China with infectious keratitis that does not respond to drug treatment.

Moreover, many of our competitors have significantly greater resources than we do. Large pharmaceutical companies, in particular, have extensive experience in clinical testing, obtaining regulatory approvals, recruiting patients, manufacturing pharmaceutical products, and commercialization. In the potential anemia market for roxadustat, for example, large and established companies such as Amgen and Roche, among others, compete aggressively to maintain their market shares. In particular, the currently marketed ESA products are supported by large pharmaceutical companies that have greater experience and expertise in commercialization in the anemia market, including in securing reimbursement, government contracts and relationships with key opinion leaders; conducting testing and clinical trials; obtaining and maintaining regulatory approvals and distribution relationships to market products; and marketing approved products. These companies also have significantly greater scale research and marketing capabilities than we do and may also have products that have been approved or are in later stages of development, and have collaboration agreements in our target markets with leading dialysis companies and research institutions. These competitors have in the past successfully prevented new and competing products from entering the anemia market, and we expect that their resources will represent challenges for us and our collaboration partners, AstraZeneca and Astellas. If we and our collaboration partners are not able to compete effectively against existing and potential competitors, our business and financial condition may be materially and adversely affected.

Our future commercial success depends upon attaining significant market acceptance of our product candidates, if approved, among physicians, patients, third party payors and others in the health care community.

Even if we obtain marketing approval for roxadustat, pamrevlumab or any other product candidates that we may develop or acquire in the future in all indications and geographic regions, these product candidates may not gain market acceptance among physicians, third party payors, patients and others in the health care community. Market acceptance of any approved product, including in roxadustat for the treatment of anemia caused by CKD in dialysis patients in China, depends on a number of other factors, including:

- the clinical indications for which the product is approved and the labeling required by regulatory authorities for use with the product, including any warnings that may be required in the labeling;
- acceptance by physicians and patients of the product as a safe and effective treatment and the willingness of the target patient population to try new therapies and of physicians to prescribe new therapies;
- the cost, safety, efficacy and convenience of treatment in relation to alternative treatments;
- the restrictions on the use of our products together with other medications, if any;
- the availability of adequate coverage and reimbursement or pricing by third party payors and government authorities;
- the ability of treatment providers, such as dialysis clinics, to enter into relationships with us without violating their existing agreement;
- the effectiveness of our sales and marketing efforts.

Table of Contents

No or limited reimbursement or insurance coverage of our approved products, if any, by third party payors may render our products less attractive to patients and healthcare providers.

Market acceptance and sales of any approved products will depend significantly on reimbursement or coverage of our products by the Chinese government or third party payors, and may be affected by existing and future healthcare reform measures or prices of related products for which the government or third party reimbursement applies. Coverage and reimbursement by the government or a third party payor may depend upon a number of factors, including the payor's determination that use of a product is:

- a covered benefit under its health plan;
- safe, effective and medically necessary;
- appropriate for the specific patient;
- cost-effective; and
- neither experimental nor investigational.

The review and publication cycle for the Chinese government to update their reimbursement lists (national or provincial) is unpredictable and is outside our control.

Obtaining coverage and reimbursement approval for a product from a government or other third party payor is a time consuming and costly process that could require us to provide supporting scientific, clinical and cost-effectiveness data for the use of our products to the payor, which we may not be able to provide. Furthermore, the reimbursement policies of third party payors may significantly change in a manner that renders our clinical data insufficient for adequate reimbursement or otherwise limits the successful marketing of our products. Even if we obtain coverage for our product candidates, third party payors may not establish adequate reimbursement amounts, which may reduce the demand for, or the price of, our products. If reimbursement is not available or is available only to limited levels, we may not be able to commercialize certain of our products.

Price controls may limit the price at which products such as roxadustat, if approved, are sold. For example, reference pricing is used by various EU member states and parallel distribution, or arbitrage between low-priced and high-priced member states, can further reduce prices. In some countries, we or our partner may be required to conduct a clinical trial or other studies that compare the cost-effectiveness of our product candidates to other available products in order to obtain or maintain reimbursement or pricing approval. Publication of discounts by third party payors or authorities may lead to further pressure on the prices or reimbursement levels within the country of publication and other countries. If reimbursement of our products is unavailable or limited in scope or amount, or if pricing is set at unacceptable levels, we or our partner may elect not to commercialize our products in such countries, and our business and financial condition could be adversely affected.

Risks Related to Our Reliance on Third Parties

If our collaborations with Astellas or AstraZeneca were terminated, or if Astellas or AstraZeneca were to prioritize other initiatives over their collaborations with us, whether as a result of a change of control or otherwise, our ability to successfully develop and commercialize our lead product candidate, roxadustat, would suffer.

We have entered into collaboration agreements with respect to the development and commercialization of our lead product candidate, roxadustat, with Astellas and AstraZeneca. These agreements provide for reimbursement of our development costs by our collaboration partners and also provide for commercialization of roxadustat throughout the major territories of the world.

Our agreements with Astellas and AstraZeneca provide each of them with the right to terminate their respective agreements with us, upon the occurrence of negative clinical results, delays in the development and commercialization of our product candidates or adverse regulatory requirements or guidance. The termination of any of our collaboration agreements would require us to fund and perform the further development and commercialization of roxadustat in the affected territory, or pursue another collaboration, which we may be unable to do, either of which could have an adverse effect on our business and operations. In addition, each of those agreements provides our respective partners the right to terminate any of those agreements upon written notice for convenience. Moreover, if Astellas or AstraZeneca, or any successor entity, were to determine that their collaborations with us are no longer a strategic priority, or if either of them or a successor were to reduce their level of commitment to their collaborations with us, our ability to develop and commercialize roxadustat could suffer. In addition, some of our collaborations are exclusive and preclude us from entering into additional collaboration agreements with other parties in the area or field of exclusivity.

If we fail to establish and maintain strategic collaborations related to our product candidates, we will bear all of the risk and costs related to the development and commercialization of any such product candidate, and we may need to seek additional financing, hire additional employees and otherwise develop expertise at significant cost. This in turn may negatively affect the development of our other product candidates as we direct resources to our most advanced product candidates.

Conflicts with our collaboration partners could jeopardize our collaboration agreements and our ability to commercialize product candidates.

Our collaboration partners have certain rights to control decisions regarding the development and commercialization of our product candidates with respect to which they are providing funding. If we have a disagreement over strategy and activities, our plans for obtaining approval may be revised and negatively affect the anticipated timing and potential for success of our product candidates. Even if a product under a collaboration agreement is approved, we will remain substantially dependent on the commercialization strategy and efforts of our collaboration partners, and neither of our collaboration partners has experience in commercialization of a novel drug such as roxadustat in the dialysis market.

With respect to our collaboration agreements for roxadustat, there are additional complexities in that we and our collaboration partners, Astellas and AstraZeneca, must reach consensus on our Phase 3 development program. Multi-party decision-making is complex and involves significant time and effort, and there can be no assurance that the parties will cooperate or reach consensus, or that one or both of our partners will not ask to proceed independently in some or all of their respective territories or functional areas of responsibility in which the applicable collaboration partner would otherwise be obligated to cooperate with us. Any disputes or lack of cooperation with us by either Astellas or AstraZeneca may negatively impact the timing or success of our planned Phase 3 clinical studies.

We intend to conduct proprietary research programs in specific disease areas that are not covered by our collaboration agreements. Our pursuit of such opportunities could, however, result in conflicts with our collaboration partners in the event that any of our collaboration partners takes the position that our internal activities overlap with those areas that are exclusive to our collaboration agreements, and we should be precluded from such internal activities. Moreover, disagreements with our collaboration partners could develop over rights to our intellectual property. In addition, our collaboration agreements may have provisions that give rise to disputes regarding the rights and obligations of the parties. Any conflict with our collaboration partners could lead to the termination of our collaboration agreements, delay collaborative activities, reduce our ability to renew agreements or obtain future collaboration agreements or result in litigation or arbitration and would negatively impact our relationship with existing collaboration partners.

Certain of our collaboration partners could also become our competitors in the future. If our collaboration partners develop competing products, fail to obtain necessary regulatory approvals, terminate their agreements with us prematurely or fail to devote sufficient resources to the development and commercialization of our product candidates, the development and commercialization of our product candidates and products could be delayed.

We rely on third parties for the conduct of most of our preclinical and clinical trials for our product candidates, and if our third party contractors do not properly and successfully perform their obligations under our agreements with them, we may not be able to obtain or may be delayed in receiving regulatory approvals for our product candidates.

We rely heavily on university, hospital, dialysis centers and other institutions and third parties, including the principal investigators and their staff, to carry out our clinical trials in accordance with our clinical protocols and designs. We also rely on a number of third party CROs to assist in undertaking, managing, monitoring and executing our ongoing clinical trials, including those for roxadustat. We expect to continue to rely on CROs, clinical data management organizations, medical institutions and clinical investigators to conduct our development efforts in the future, including our Phase 3 development program for roxadustat. We compete with many other companies for the resources of these third parties, and large pharmaceutical companies often have significantly more extensive agreements and relationships with such third party providers, and such third party providers may prioritize the requirements of such large pharmaceutical companies over ours. The third parties on whom we rely may terminate their engagements with us at any time, which may cause delay in the development and commercialization of our product candidates. If any such third party terminates its engagement with us or fails to perform as agreed, we may be required to enter into alternative arrangements, which would result in significant cost and delay to our product development program. Moreover, our agreements with such third parties generally do not provide assurances regarding employee turnover and availability, which may cause interruptions in the research on our product candidates by such third parties.

Moreover, while our reliance on these third parties for certain development and management activities will reduce our control over these activities, it will not relieve us of our responsibilities. For example, the FDA and foreign regulatory authorities require compliance with regulations and standards, including GCP requirements for designing, conducting, monitoring, recording, analyzing and reporting the results of clinical trials to ensure that the data and results from trials are credible and accurate and that the rights, integrity and confidentiality of trial participants are protected. Although we rely on third parties to conduct our clinical trials, we, as the sponsor, remain responsible for ensuring that each of these clinical trials is conducted in accordance with its general investigational plan and protocol under legal and regulatory requirements, including GCP. Regulatory authorities enforce these GCP requirements through periodic inspections of trial sponsors, principal investigators and trial sites.

If any of our CROs, trial sites, principal investigators or other third parties fail to comply with applicable GCP requirements, other regulations, trial protocol or other requirements under their agreements with us, the quality or accuracy of the data they obtain may be compromised or unreliable, and the trials of our product candidates may not meet regulatory requirements. If trials do not meet regulatory requirements or if these third parties need to be replaced, the development of our product candidates may be delayed, suspended or terminated, regulatory authorities may require us to exclude the use of patient data from our approval applications or perform additional clinical trials before approving our marketing applications. Regulatory authorities may even reject our application for approval or refuse to accept our future applications for an extended time period. We cannot assure that upon inspection by a regulatory authority, such regulatory authority will determine that any of our clinical trials comply with GCP requirements or that our results may be used in support of our regulatory submissions. If any of these events occur, we may not be able to obtain regulatory approval for our product candidates on a timely basis, at a reasonable cost, or at all.

We currently rely, and expect to continue to rely, on third parties to conduct many aspects of our clinical studies and product manufacturing, and these third parties may not perform satisfactorily.

We do not have operating manufacturing facilities at this time other than our roxadustat and FG-5200 manufacturing facility in China, and our current commercial manufacturing facility plans in China are not expected to satisfy the requirements necessary to support development and commercialization outside of China. Other than in and for China specifically, we do not expect to independently manufacture our products. We currently rely, and expect to continue to rely, on third parties to scale-up, manufacture and supply roxadustat and our other product candidates outside of China. Risks arising from our reliance on third party manufacturers include:

- reduced control and additional burdens of oversight as a result of using third party manufacturers for all aspects of manufacturing activities, including regulatory compliance and quality control and quality assurance;
- termination of manufacturing agreements, termination fees associated with such termination, or nonrenewal of manufacturing
 agreements with third parties may negatively impact our planned development and commercialization activities;
- the possible misappropriation of our proprietary technology, including our trade secrets and know-how; and
- disruptions to the operations of our third party manufacturers or suppliers unrelated to our product, including the merger, acquisition, or bankruptcy of a manufacturer or supplier or a catastrophic event affecting our manufacturers or suppliers.

Table of Contents

Any of these events could lead to development delays or failure to obtain regulatory approval, or affect our ability to successfully commercialize our product candidates. Some of these events could be the basis for action by the FDA or another regulatory authority, including injunction, recall, seizure or total or partial suspension of production.

The facilities used by our contract manufacturer to manufacture our product candidates must pass inspections by the FDA and other regulatory authorities. Although, except for China, we do not control the manufacturing operations of, and expect to remain completely dependent on, our contract manufacturers for manufacture of drug substance and finished drug product, we are ultimately responsible for ensuring that our product candidates are manufactured in compliance with cGMP requirements. If our contract manufacturers cannot successfully manufacture material that conforms to our or our collaboration partners' specifications, or the regulatory requirements of the FDA or other regulatory authorities, we may not be able to secure and/or maintain regulatory approval for our product candidates and our development or commercialization plans may be delayed. In addition, we have no control over the ability of our contract manufacturers to maintain adequate quality control, quality assurance and qualified personnel. In addition, although our longer-term agreements are expected to provide for requirements to meet our quantity and quality requirements to manufacture our products candidates for clinical studies and commercial sale, we will have minimal direct control over the ability of our contract manufacturers to maintain adequate quality control, quality assurance and qualified personnel and we expect to rely on our audit rights to ensure that those qualifications are maintained to meet our requirements. If our contract manufacturers' facilities do not pass inspection by regulatory authorities, or if regulatory authorities do not approve these facilities for the manufacture of our products, or withdraw any such approval in the future, we would need to identify and qualify alternative manufacturing facilities, which would significantly impact our ability to develop, obtain regulatory approval for or market our products, if approved. Moreover, any failure of our third party manufacturers, to comply with applicable regulations could result in sanctions being imposed on us or adverse regulatory consequences, including clinical holds, warnings or untitled letters, fines, injunctions, civil penalties, delays, suspension or withdrawal of approvals, license revocation, seizures or recalls of product candidates or products, operating restrictions and criminal prosecutions, any of which would be expected to significantly and adversely affect supplies of our products to us and our collaboration partners.

Any of our third party manufacturers may terminate their engagement with us at any time and we have not yet entered into any commercial supply agreements for the manufacture of active pharmaceutical ingredients ("APIs") or drug products. With respect to roxadustat, AstraZeneca and Astellas have certain rights to assume manufacturing of roxadustat and the existence of those rights may limit our ability to enter into favorable long-term supply agreements, if at all, with other third party manufacturers. In addition, our product candidates and any products that we may develop may compete with other product candidates and products for access and prioritization to manufacture. Certain third party manufacturers may be contractually prohibited from manufacturing our product due to non-compete agreements with our competitors or a commitment to grant another party priority relative to our products. There are a limited number of third party manufacturers that operate under cGMP and that might be capable of manufacturing to meet our requirements. Due to the limited number of third party manufacturers with the contractual freedom, expertise, required regulatory approvals and facilities to manufacture our products on a commercial scale, identifying and qualifying a replacement third party manufacturer would be expensive and time-consuming and may cause delay or interruptions in the production of our product candidates or products, which in turn may delay, prevent or impair our development and commercialization efforts.

We have a letter agreement with IRIX Pharmaceuticals, Inc. ("IRIX"), a third party manufacturer that we have used in the past, pursuant to which we agreed to negotiate a single source manufacturing agreement that included a right of first negotiation for the cGMP manufacture of HIF-PH inhibitors, including roxadustat, provided that IRIX is able to match any third party bids within 5%. The exclusive right to manufacture extends for five years after approval of an NDA for those compounds, and any agreement would provide that no minimum amounts would be specified until appropriate by forecast and that we and a commercialization partner would have the rights to contract with independent third parties that exceed IRIX's internal manufacturing capabilities or in the event that we or our commercialization partner determines for reasons of continuity of supply and security that such a need exists, provided that IRIX would supply no less than 65% of the product if it is able to provide this level of supply. Subsequent to the letter agreement, we and IRIX have entered into several additional service agreements. IRIX has requested in writing that we honor the letter agreement with respect to the single source manufacturing agreement, and if we were to enter into any such exclusive manufacturing agreement, there can be no assurance that IRIX will not assert a claim for right to manufacture roxadustat or that IRIX could manufacture roxadustat successfully and in accordance with applicable regulations for a commercial product and the specifications of our collaboration partners. In 2015, Patheon Pharmaceuticals Inc., a business unit of DPx Holdings B.V. ("Patheon"), acquired IRIX, and in 2017 ThermoFisher Scientific Inc. acquired Patheon.

If any third party manufacturer terminates its engagement with us or fails to perform as agreed, we may be required to find replacement manufacturers, which would result in significant cost and delay to our development programs. Although we believe that there are several potential alternative manufacturers who could manufacture our product candidates, we may incur significant delays and added costs in identifying, qualifying and contracting with any such third party or potential second source manufacturer. In any event, with any third party manufacturer we expect to enter into technical transfer agreements and share our know-how with the third party manufacturer, which can be time-consuming and may result in delays. These delays could result in a suspension or delay of marketing roxadustat.

Certain of the components of our product candidates are acquired from single-source suppliers and have been purchased without long-term supply agreements. The loss of any of these suppliers, or their failure to supply us with supplies of sufficient quantity and quality to complete our drug substance or finished drug product of acceptable quality and an acceptable price, would materially and adversely affect our business.

We do not have an alternative supplier of certain components of our product candidates. To date, we have used purchase orders for the supply of materials that we use in our product candidates. We may be unable to enter into long-term commercial supply arrangements with our vendors, or do so on commercially reasonable terms, which could have a material adverse impact upon our business. In addition, we currently rely on our contract manufacturers to purchase from third-party suppliers some of the materials necessary to produce our product candidates. We do not have direct control over the acquisition of those materials by our contract manufacturers. Moreover, we currently do not have any agreements for the commercial production of those materials.

The logistics of our supply chain, which include shipment of materials and intermediates from countries such as China and India add additional time and risk (including risk of loss) to the manufacture of our product candidates. While we have in the past maintained sufficient inventory of materials, API, and drug product to meet our and our collaboration partners' needs for roxadustat to date, the lead time and regulatory approvals required to source from and into countries outside of the U.S. increase the risk of delay and potential shortages of supply.

Risks Related to Our Intellectual Property

If our efforts to protect our proprietary technologies are not adequate, we may not be able to compete effectively in our market.

We rely upon a combination of patents, trade secret protection and contractual arrangements to protect the intellectual property related to our technologies. We will only be able to protect our products and proprietary information and technology by preventing unauthorized use by third parties to the extent that our patents, trade secrets, and contractual position allow us to do so. Any disclosure to or misappropriation by third parties of our trade secrets or confidential information could compromise our competitive position. Moreover, we are involved in, have in the past been involved in, and may in the future be involved in legal or administrative proceedings involving our intellectual property initiated by third parties, and which proceedings can result in significant costs and commitment of management time and attention. As our product candidates continue in development, third parties may attempt to challenge the validity and enforceability of our patents and proprietary information and technologies.

We also are involved in, have in the past been involved in, and may in the future be involved in initiating legal or administrative proceedings involving the product candidates and intellectual property of our competitors. These proceedings can result in significant costs and commitment of management time and attention, and there can be no assurance that our efforts would be successful in preventing or limiting the ability of our competitors to market competing products.

Composition-of-matter patents relating to the API are generally considered to be the strongest form of intellectual property protection for pharmaceutical products, as such patents provide protection not limited to any one method of use. Method-of-use patents protect the use of a product for the specified method(s), and do not prevent a competitor from making and marketing a product that is identical to our product for an indication that is outside the scope of the patented method. We rely on a combination of these and other types of patents to protect our product candidates, and there can be no assurance that our intellectual property will create and sustain the competitive position of our product candidates.

Biotechnology and pharmaceutical product patents involve highly complex legal and scientific questions and can be uncertain. Any patent applications that we own or license may fail to result in issued patents. Even if patents do successfully issue from our applications, third parties may challenge their validity or enforceability, which may result in such patents being narrowed, invalidated, or held unenforceable. Even if our patents and patent applications are not challenged by third parties, those patents and patent applications may not prevent others from designing around our claims and may not otherwise adequately protect our product candidates. If the breadth or strength of protection provided by the patents and patent applications we hold with respect to our product candidates is threatened, competitors with significantly greater resources could threaten our ability to commercialize our product candidates. Discoveries are generally published in the scientific literature well after their actual development, and patent applications in the U.S. and other countries are typically not published until 18 months after their filing, and in some cases are never published. Therefore, we cannot be certain that we or our licensors were the first to make the inventions claimed in our owned and licensed patents or patent applications, or that we or our licensors were the first to file for patent protection covering such inventions. Subject to meeting other requirements for patentability, for U.S. patent applications filed prior to March 16, 2013, the first to invent the claimed invention is entitled to receive patent protection for that invention while, outside the U.S., the first to file a patent application encompassing the invention is entitled to patent protection for the invention. The U.S. moved to a "first to file" system under the Leahy-Smith America Invents Act ("AIA"), effective March 16, 2013. This system also includes procedures for challenging issued patents and pending patent applications, which creates additional uncertainty. We may become involved in opposition or interference proceedings challenging our patents and patent applications or the patents and patent applications of others, and the outcome of any such proceedings are highly uncertain. An unfavorable outcome in any such proceedings could reduce the scope of or invalidate our patent rights, allow third parties to commercialize our technology and compete directly with us, or result in our inability to manufacture, develop or commercialize our product candidates without infringing the patent rights of others.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 80 of 1730

Table of Contents

In addition to the protection afforded by patents, we seek to rely on trade secret protection and confidentiality agreements to protect proprietary know-how, information, or technology that is not covered by our patents. Although our agreements require all of our employees to assign their inventions to us, and we require all of our employees, consultants, advisors and any third parties who have access to our trade secrets, proprietary know-how and other confidential information and technology to enter into appropriate confidentiality agreements, we cannot be certain that our trade secrets, proprietary know-how and other confidential information and technology will not be subject to unauthorized disclosure or that our competitors will not otherwise gain access to or independently develop substantially equivalent trade secrets, proprietary know-how and other information and technology. Furthermore, the laws of some foreign countries, in particular, China, where we have operations, do not protect proprietary rights to the same extent or in the same manner as the laws of the U.S. As a result, we may encounter significant problems in protecting and defending our intellectual property globally. If we are unable to prevent unauthorized disclosure of our intellectual property related to our product candidates and technology to third parties, we may not be able to establish or maintain a competitive advantage in our market, which could materially adversely affect our business and operations.

Intellectual property disputes with third parties and competitors may be costly and time consuming, and may negatively affect our competitive position.*

Our commercial success may depend on our avoiding infringement of the patents and other proprietary rights of third parties as well as on enforcing our patents and other proprietary rights against third parties. Pharmaceutical and biotechnology intellectual property disputes are characterized by complex, lengthy and expensive litigation over patents and other intellectual property rights. We may initiate or become party to or be threatened with future litigation or other proceedings regarding intellectual property rights with respect to our product candidates and competing products.

As our product candidates progress toward commercialization, we or our collaboration partners may be subject to patent infringement claims from third parties. We attempt to ensure that our product candidates do not infringe third party patents and other proprietary rights. However, the patent landscape in competitive product areas is highly complex, and there may be patents of third parties of which we are unaware that may result in claims of infringement. Accordingly, there can be no assurance that our product candidates do not infringe proprietary rights of third parties, and parties making claims against us may seek and obtain injunctive or other equitable relief, which could potentially block further efforts to develop and commercialize our product candidates including roxadustat or pamrevlumab. Any litigation involving defense against claims of infringement, regardless of the merit of such claims, would involve substantial litigation expense and would be a substantial diversion of management time.

We may consider administrative proceedings and other means for challenging third party patents and patent applications. An unfavorable outcome in any such challenge could require us to cease using the related technology and to attempt to license rights to it from the prevailing third party, which may not be available on commercially reasonable terms, if at all, in which case our business could be harmed.

We intend, if necessary, to vigorously enforce our intellectual property in order to protect the proprietary position of our product candidates, including roxadustat and pamrevlumab. In addition, our collaboration partners who have been granted licenses to our patents may also have rights related to enforcement of those patents. Active efforts to enforce our patents by us or by our partners may include litigation, administrative proceedings, or both, depending on the potential benefits that might be available from those actions and the costs associated with undertaking those efforts against third parties. We carefully review and monitor publicly available information regarding products that may be competitive with our product candidates and assert our intellectual property rights where appropriate. For example, we previously prevailed in an administrative challenge initiated by a major biopharmaceutical company regarding our intellectual property rights, maintaining our intellectual property in all relevant scope, and will continue to protect and enforce our intellectual property rights. In addition, our partner Astellas has recently initiated *quia timet* infringement actions against Akebia and GSK based on our specific patents in the United Kingdom in response to actions taken by Akebia and GSK against those patents, as further detailed below.

Third parties may also challenge our patents and patent applications, through interference, reexamination, *inter partes* review, and post-grant review proceedings before the U.S. Patent and Trademark Office ("USPTO") or through comparable proceedings in other territories. For example, Akebia and others have filed oppositions against certain European patents within our HIF anemia-related technologies patent portfolio. In three of these proceedings, for FibroGen European Patent Nos. 1463823, 1633333, and 2322155, the European Patent Office has handed down decisions unfavorable to FibroGen. In a fourth of these proceedings, the European Patent Office issued a decision favorable to FibroGen, maintaining FibroGen European Patent No. 2322153 in amended form. All of these decisions are currently under appeal, and these four patents are valid and enforceable pending resolution of the appeals. The ultimate outcomes of such proceedings remain uncertain, and ultimate resolution of the appeals may take two years or longer. In addition, Akebia recently filed oppositions against FibroGen European Patent Nos. 2289531 and 2298301. As mentioned above, Akebia and GSK have also initiated actions in the United Kingdom against the United Kingdom counterparts of each of these European Patent Nos. 2322153 and 2322155) with respect to its daprodustat product. Akebia is also pursuing invalidation actions against corresponding patents in Canada and in Japan. While we believe the ultimate outcome of all proceedings will be that these FibroGen patents will be upheld in relevant part, we note that narrowing or even revocation of any of these patents would not affect our exclusivity for roxadustat or our freedom-to-operate with respect to use of roxadustat for the treatment of anemia.

Oppositions have also recently been filed against our European Patent No. 2872488, which claims a crystalline form of roxadustat.

Furthermore, there is a risk that any public announcements concerning the status or outcomes of intellectual property litigation or administrative proceedings may adversely affect the price of our stock. If securities analysts or our investors interpret such status or outcomes as negative or otherwise creating uncertainty, our common stock price may be adversely affected.

Our reliance on third parties and agreements with collaboration partners requires us to share our trade secrets, which increases the possibility that a competitor may discover them or that our trade secrets will be misappropriated or disclosed.

Our reliance on third party contractors to develop and manufacture our product candidates is based upon agreements that limit the rights of the third parties to use or disclose our confidential information, including our trade secrets and know-how. Despite the contractual provisions, the need to share trade secrets and other confidential information increases the risk that such trade secrets and information are disclosed or used, even if unintentionally, in violation of these agreements. In the highly competitive markets in which our product candidates are expected to compete, protecting our trade secrets, including our strategies for addressing competing products, is imperative, and any unauthorized use or disclosure could impair our competitive position and may have a material adverse effect on our business and operations.

In addition, our collaboration partners are larger, more complex organizations than ours, and the risk of inadvertent disclosure of our proprietary information may be increased despite their internal procedures and contractual obligations in place with our collaboration partners. Despite our efforts to protect our trade secrets and other confidential information, a competitor's discovery of such trade secrets and information could impair our competitive position and have an adverse impact on our business.

We have an extensive worldwide patent portfolio. The cost of maintaining our patent protection is high and maintaining our patent protection requires continuous review and compliance in order to maintain worldwide patent protection. We may not be able to effectively maintain our intellectual property position throughout the major markets of the world.

The USPTO and foreign patent authorities require maintenance fees and payments as well as continued compliance with a number of procedural and documentary requirements. Noncompliance may result in abandonment or lapse of the subject patent or patent application, resulting in partial or complete loss of patent rights in the relevant jurisdiction. Non-compliance may result in reduced royalty payments for lack of patent coverage in a particular jurisdiction from our collaboration partners or may result in competition, either of which could have a material adverse effect on our business.

We have made, and will continue to make, certain strategic decisions in balancing costs and the potential protection afforded by the patent laws of certain countries. As a result, we may not be able to prevent third parties from practicing our inventions in all countries throughout the world, or from selling or importing products made using our inventions in and into the U.S. or other countries. Third parties may use our technologies in territories in which we have not obtained patent protection to develop their own products and, further, may infringe our patents in territories which provide inadequate enforcement mechanisms, even if we have patent protection. Such third party products may compete with our product candidates, and our patents or other intellectual property rights may not be effective or sufficient to prevent them from competing.

The laws of some foreign countries do not protect proprietary rights to the same extent as do the laws of the U.S., and we may encounter significant problems in securing and defending our intellectual property rights outside the U.S.

Many companies have encountered significant problems in protecting and defending intellectual property rights in certain countries. The legal systems of certain countries, particularly certain developing countries such as China, do not always favor the enforcement of patents, trade secrets, and other intellectual property rights, particularly those relating to pharmaceutical and biotechnology products, which could make it difficult for us to stop infringement of our patents, misappropriation of our trade secrets, or marketing of competing products in violation of our proprietary rights. In China, our intended establishment of significant operations will depend in substantial part on our ability to effectively enforce our intellectual property rights in that country. Proceedings to enforce our intellectual property rights in foreign countries could result in substantial costs and divert our efforts and attention from other aspects of our business, and could put our patents in these territories at risk of being invalidated or interpreted narrowly, or our patent applications at risk of not being granted, and could provoke third parties to assert claims against us. We may not prevail in all legal or other proceedings that we may initiate and, if we were to prevail, the damages or other remedies awarded, if any, may not be commercially meaningful. Accordingly, our efforts to enforce our intellectual property rights around the world may be inadequate to obtain a significant commercial advantage from the intellectual property that we develop or license.

Intellectual property rights do not address all potential threats to any competitive advantage we may have.

The degree of future protection afforded by our intellectual property rights is uncertain because intellectual property rights have limitations, and intellectual property rights may not adequately protect our business or permit us to maintain our competitive advantage. The following examples are illustrative:

- Others may be able to make compounds that are the same as or similar to our current or future product candidates but that are not
 covered by the claims of the patents that we own or have exclusively licensed.
- We or any of our licensors or strategic partners might not have been the first to make the inventions covered by the issued patent or pending patent application that we own or have exclusively licensed.
- We or any of our licensors or strategic partners might not have been the first to file patent applications covering certain of our inventions.
- Others may independently develop similar or alternative technologies or duplicate any of our technologies without infringing our intellectual property rights.
- The prosecution of our pending patent applications may not result in granted patents.
- Granted patents that we own or have exclusively licensed may not provide us with any competitive advantages, or may be held invalid
 or unenforceable, as a result of legal challenges by our competitors.
- Patent protection on our product candidates may expire before we are able to develop and commercialize the product, or before we are able to recover our investment in the product.
- Our competitors might conduct research and development activities in the U.S. and other countries that provide a safe harbor from
 patent infringement claims for such activities, as well as in countries in which we do not have patent rights, and may then use the
 information learned from such activities to develop competitive products for sale in markets where we intend to market our product
 candidates.

Roxadustat is considered a Class 2 substance on the 2019 World Anti-Doping Agency Prohibited List which could limit sales and increase security and distribution costs for us and our partners, particularly in China.

Roxadustat is considered a Class 2 substance on the World Anti-Doping Agency ("WADA") Prohibited List. There are enhanced security and distribution procedures we and our collaboration partners and third-party contractors will have to take to limit the risk of loss of product in the supply chain. As a result, our distribution, manufacturing and sales costs for roxadustat, as well as for our partners, will be increased which will reduce profitability. In addition there is a risk of reduced sales due to patient access to this drug. This is particularly the case in China where we will not be able to sell roxadustat in private pharmacies due to the WADA classification. While private pharmacies only represent approximately 10% of the market in China, this will negatively affect sales and therefore the profitability of roxadustat and the Company as a whole.

The existence of counterfeit pharmaceutical products in pharmaceutical markets may compromise our brand and reputation and have a material adverse effect on our business, operations and prospects.

Counterfeit products, including counterfeit pharmaceutical products, are a significant problem, particularly in China. Counterfeit pharmaceuticals are products sold or used for research under the same or similar names, or similar mechanism of action or product class, but which are sold without proper licenses or approvals, and are often lower cost, lower quality, different potency, or have different ingredients or formulations, and have the potential to damage the reputation for quality and effectiveness of the genuine product. Such products may be used for indications or purposes that are not recommended or approved or for which there is no data or inadequate data with regard to safety or efficacy. Such products divert sales from genuine products. If counterfeit pharmaceuticals illegally sold or used for research result in adverse events or side effects to consumers, we may be associated with any negative publicity resulting from such incidents. Consumers may buy counterfeit pharmaceuticals that are in direct competition with our pharmaceuticals, which could have an adverse impact on our revenues, business and results of operations. In addition, the use of counterfeit products could be used in non-clinical or clinical studies, or could otherwise produce undesirable side effects or adverse events that may be attributed to our products as well, which could cause us or regulatory authorities to interrupt, delay or halt clinical trials and could result in the delay or denial of regulatory approval by the FDA or other regulatory authorities and potential product liability claims. With respect to China, although the government has recently been increasingly active in policing counterfeit pharmaceuticals, there is not yet an effective counterfeit pharmaceutical regulation control and enforcement system in China. As a result, we may not be able to prevent third parties from selling or purporting to sell our products in China. The proliferation of counterfeit pharmaceuticals has grown in recent years and may continue to grow in the future. The existence of and any increase in the sales and production of counterfeit pharmaceuticals, or the technological capabilities of counterfeiters, could negatively impact our revenues, brand reputation, business and results of operations.

Risks Related to Government Regulation

The regulatory approval process is highly uncertain and we may not obtain regulatory approval for the commercialization of our product candidates.

The time required to obtain approval by the FDA and comparable foreign regulatory authorities is unpredictable, but typically takes many years following the commencement of preclinical studies and clinical trials and depends upon numerous factors, including the substantial discretion of the regulatory authorities. In addition, approval policies, regulations, or the type and amount of clinical data necessary to gain approval may change during the course of a product candidate's clinical development and may vary among jurisdictions. Except in China, We have not obtained regulatory approval for any product candidate, and it is possible that neither roxadustat nor pamrevlumab, nor any future product candidates we may discover, in-license or acquire and seek to develop in the future, will obtain regulatory approval in countries other than China.

Our product candidates could fail to receive regulatory approval from the FDA or other regulatory authorities for many reasons, including:

- disagreement over the design or implementation of our clinical trials;
- failure to demonstrate that a product candidate is safe and effective for its proposed indication;
- failure of clinical trials to meet the level of statistical significance required for approval;
- failure to demonstrate that a product candidate's clinical and other benefits outweigh its safety risks;
- disagreement over our interpretation of data from preclinical studies or clinical trials;
- disagreement over whether to accept efficacy results from clinical trial sites outside the U.S. where the standard of care is potentially different from that in the U.S.:
- the insufficiency of data collected from clinical trials of our present or future product candidates to support the submission and filing of an NDA or other submission or to obtain regulatory approval;

Table of Contents

- disapproval of the manufacturing processes or facilities of either our manufacturing plant or third party manufacturers with whom we contract for clinical and commercial supplies; or
- changes in the approval policies or regulations that render our preclinical and clinical data insufficient for approval.

The FDA or other regulatory authorities may require more information, including additional preclinical or clinical data to support approval, which may delay or prevent approval and our commercialization plans, or we may decide to abandon the development program altogether. Even if we do obtain regulatory approval, our product candidates may be approved for fewer or more limited indications than we request, approval may be contingent on the performance of costly post-marketing clinical trials, or approval may require labeling that does not include the labeling claims necessary or desirable for the successful commercialization of that product candidate. In addition, if our product candidates produce undesirable side effects or safety issues, the FDA may require the establishment of REMS or other regulatory authorities may require the establishment of a similar strategy, that may restrict distribution of our approved products, if any, and impose burdensome implementation requirements on us. Any of the foregoing scenarios could materially harm the commercial prospects for our product candidates.

Even if we believe our current or planned clinical trials are successful, regulatory authorities may not agree that our completed clinical trials provide adequate data on safety or efficacy. Approval by one regulatory authority does not ensure approval by any other regulatory authority. However, a failure or delay in obtaining regulatory approval in one country may have a negative effect on the regulatory process in others. We may not be able to file for regulatory approvals and even if we file we may not receive the necessary approvals to commercialize our product candidates in any market.

If our product candidates obtain marketing approval, we will be subject to more extensive healthcare laws, regulation and enforcement and our failure to comply with those laws could have a material adverse effect on our results of operations and financial condition.

If we obtain approval in the U.S. for any of our product candidates, the regulatory requirements applicable to our operations, in particular our sales and marketing efforts, will increase significantly with respect to our operations and the potential for civil and criminal enforcement by the federal government and the states and foreign governments will increase with respect to the conduct of our business. The laws that may affect our operations in the U.S. include:

- the federal Anti-Kickback Statute, which prohibits, among other things, persons from knowingly and willfully soliciting, receiving,
 offering or paying remuneration, directly or indirectly, to induce, or in return for, the purchase or recommendation of an item or service
 reimbursable under a federal healthcare program, such as the Medicare and Medicaid programs;
- federal civil and criminal false claims laws and civil monetary penalty laws, which prohibit, among other things, individuals or entities from knowingly presenting, or causing to be presented, claims for payment from Medicare, Medicaid, or other third party payors that are false or fraudulent;
- the Health Insurance Portability and Accountability Act of 1996 ("HIPAA"), which created new federal criminal statutes that prohibit
 executing a scheme to defraud any healthcare benefit program and making false statements relating to healthcare matters;
- HIPAA, as amended by Health Information Technology and Clinical Health Act, and its implementing regulations, which imposes
 certain requirements relating to the privacy, security, and transmission of individually identifiable health information;
- the federal physician sunshine requirements under the Patient Protection and Affordable Care Act ("PPACA"), which requires
 manufacturers of drugs, devices, biologics, and medical supplies to report annually to the Centers for Medicare and Medicaid Services
 ("CMS"), information related to payments and other transfers of value to physicians, other healthcare providers, and teaching
 hospitals, and ownership and investment interests held by physicians and other healthcare providers and their immediate family
 members;

Table of Contents

- foreign and state law equivalents of each of the above federal laws, such as the U.S. Foreign Corrupt Practices Act ("FCPA"), anti-kickback and false claims laws that may apply to items or services reimbursed by any third party payor, including commercial insurers; state laws that require pharmaceutical companies to comply with the pharmaceutical industry's voluntary compliance guidelines and the applicable compliance guidance promulgated by the federal government, or otherwise restrict payments that may be made to healthcare providers and other potential referral sources; state laws that require drug manufacturers to report information related to payments and other transfers of value to physicians and other healthcare providers or marketing expenditures; and state laws governing the privacy and security of health information in certain circumstances, many of which differ from each other in significant ways, thus complicating compliance efforts; and
- the Trade Agreements Act ("TAA"), which requires that drugs sold to the U.S. Government must be manufactured in the U.S. or in TAA approved and designated countries. Drugs manufactured in countries not approved under the TAA, may not be sold to the U.S. without specific regulatory approval. We have little experience with this regulation and there is a risk that drugs made from Chinesemade API may not be sold to an entity of the U.S. such as the Veterans Health Administration ("VA") due to our inability to obtain regulatory approval. While there have been recent VA policy changes that appear to allow for sale of drugs from non-TAA approved countries, this policy may change or there may be additional policies or legislation that affect our ability to sell drug to the U.S. Government.

The scope of these laws and our lack of experience in establishing the compliance programs necessary to comply with this complex and evolving regulatory environment increases the risks that we may unknowingly violate the applicable laws and regulations. If our operations are found to be in violation of any of such laws or any other governmental regulations that apply to us, we may be subject to penalties, including civil and criminal penalties, damages, fines, the curtailment or restructuring of our operations, the exclusion from participation in federal and state healthcare programs and imprisonment, any of which could materially adversely affect our ability to operate our business and our financial results.

The impact of recent U.S. healthcare reform, its potential partial or full repeal, and other changes in the healthcare industry and in healthcare spending is currently unknown, and may adversely affect our business model.

The commercial potential for our approved products could be affected by changes in healthcare spending and policy in the U.S. and abroad. We operate in a highly regulated industry and new laws, regulations or judicial decisions, or new interpretations of existing laws, regulations or decisions, related to healthcare availability, the method of delivery or payment for healthcare products and services could negatively impact our business, operations and financial condition.

In the U.S., the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 ("MMA") altered Medicare coverage and payments for pharmaceutical products. The legislation expanded Medicare coverage for drug purchases by the elderly and introduced a new reimbursement methodology based on average sales prices for physician-administered drugs. The MMA also provided authority for limiting the number of drugs that will be covered in any therapeutic class and as a result, we expect that there will be additional pressure to reduce costs. For example, the CMS in implementing the MMA has enacted regulations that reduced capitated payments to dialysis providers. These cost reduction initiatives and other provisions of the MMA could decrease the scope of coverage and the price that may be received for any approved dialysis products and could seriously harm our business and financial condition. While the MMA applies only to drug benefits for Medicare beneficiaries, private payors often follow Medicare coverage policies and payment limitations in setting their own reimbursement rates, and any reduction in reimbursement that results from the MMA may cause a similar reduction in payments from private payors. Similar regulations or reimbursement policies have been enacted in many international markets which could similarly impact the commercial potential for our products.

Under the Medicare Improvements for Patients and Providers Act ("MIPPA"), a basic case-mix adjusted composite, or bundled, payment system commenced in January 2011 and transitioned fully by January 2014 to a single reimbursement rate for drugs and all services furnished by renal dialysis centers for Medicare beneficiaries with end-stage renal disease. Specifically, under MIPPA the bundle now covers drugs, services, lab tests and supplies under a single treatment base rate for reimbursement by the CMS based on the average cost per treatment, including the cost of ESAs and IV iron doses, typically without adjustment for usage. It is unknown whether roxadustat, if approved in the U.S., will be included in the payment bundle. Under MIPPA, agents that have no IV equivalent in the bundle are currently expected to be excluded from the bundle until 2025. If roxadustat were included in the bundle, it may reduce the price that could be charged for roxadustat, and therefore potentially limit our profitability. Based on roxadustat's differentiated mechanism of action and therapeutic effects, and discussions with our collaboration partner, we currently believe that roxadustat might not be included in the bundle. If roxadustat is reimbursed outside of the bundle, it may potentially limit or delay market penetration of roxadustat.

Table of Contents

More recently, the PPACA was enacted in 2010 with a goal of reducing the cost of healthcare and substantially changing the way healthcare is financed by both government and private insurers. The PPACA, among other things, increases the minimum Medicaid rebates owed by manufacturers under the Medicaid Drug Rebate Program and extends the rebate program to individuals enrolled in Medicaid managed care organizations, establishes annual fees and taxes on manufacturers of certain branded prescription drugs, and creates a new Medicare Part D coverage gap discount program, in which manufacturers must agree to offer 50% point-of-sale discounts off negotiated prices of applicable brand drugs to eligible beneficiaries during their coverage gap period as a condition for the manufacturer's outpatient drugs to be covered under Medicare Part D. In addition, other legislative changes have been proposed and adopted in the U.S. since the PPACA was enacted. On August 2, 2011, the Budget Control Act of 2011 created measures for spending reductions by Congress. A Joint Select Committee on Deficit Reduction, tasked with recommending a targeted deficit reduction of at least \$1.2 trillion for the years 2013 through 2021, was unable to reach required goals, thereby triggering the legislation's automatic reduction to several government programs. This includes aggregate reductions of Medicare payments to providers of up to 2% per fiscal year, which went into effect on April 1, 2013.

It is likely that federal and state legislatures within the U.S. and foreign governments will continue to consider changes to existing healthcare legislation. We cannot predict the reform initiatives that may be adopted in the future or whether initiatives that have been adopted will be repealed or modified. The continuing efforts of the government, insurance companies, managed care organizations and other payors of healthcare services to contain or reduce costs of healthcare may adversely affect:

- the demand for any products that may be approved for sale;
- the price and profitability of our products;
- pricing, coverage and reimbursement applicable to our products;
- the ability to successfully position and market any approved product; and
- the taxes applicable to our pharmaceutical product revenues.

Some of the provisions of the PPACA have yet to be fully implemented, while certain provisions have been subject to judicial and Congressional challenges. In January 2017, Congress voted to adopt a budget resolution for fiscal year 2017, that while not a law, is widely viewed as the first step toward the passage of legislation that would repeal certain aspects of the PPACA. Further, on January 20, 2017, President Trump signed an Executive Order directing federal agencies with authorities and responsibilities under the Affordable Care Act to waive, defer, grant exemptions from, or delay the implementation of any provision of the Affordable Care Act that would impose a fiscal burden on states or a cost, fee, tax, penalty or regulatory burden on individuals, healthcare providers, health insurers, or manufacturers of pharmaceuticals or medical devices. Congress also could consider subsequent legislation to replace elements of the Affordable Care Act that are repealed. Given these possibilities and others we may not anticipate, the full extent to which our business, results of operations and financial condition could be adversely affected by the recent proposed legislation and the Executive Order is uncertain. The implementation of cost containment measures or other healthcare reforms may prevent us from being able to generate revenue, attain profitability, or commercialize our drugs.

Furthermore, legislative and regulatory proposals have been made to expand post-approval requirements and restrict sales and promotional activities for pharmaceutical products. We cannot be sure whether additional legislative changes will be enacted, or whether FDA regulations, guidance or interpretations will be changed, or what the impact of such changes on the regulatory approvals of our product candidates, if any, may be. In addition, increased scrutiny by the U.S. Congress of the FDA's approval process may significantly delay or prevent regulatory approval, as well as subject us to more stringent product labeling and post-marketing testing and other requirements.

We may not be able to conduct, or contract others to conduct, animal testing in the future, which could harm our research and development activities.

Certain laws and regulations relating to drug development require us to test our product candidates on animals before initiating clinical trials involving humans. Animal testing activities have been the subject of controversy and adverse publicity. Animal rights groups and other organizations and individuals have attempted to stop animal testing activities by pressing for legislation and regulation in these areas and by disrupting these activities through protests and other means. To the extent the activities of these groups are successful, our research and development activities may be interrupted or delayed.

Our employees may engage in misconduct or other improper activities, including noncompliance with regulatory standards and requirements, which could result in significant liability for us and harm our reputation.

We are exposed to the risk of employee fraud or other misconduct, including intentional failure to:

- comply with FDA regulations or similar regulations of comparable foreign regulatory authorities;
- provide accurate information to the FDA or comparable foreign regulatory authorities;
- · comply with manufacturing standards we have established;
- comply with privacy laws protecting personal information;
- comply with federal and state healthcare fraud and abuse laws and regulations and similar laws and regulations established and enforced by comparable foreign regulatory authorities;
- comply with the FCPA and other anti-bribery laws;
- report financial information or data accurately;
- or disclose unauthorized activities to us.

Employee misconduct could also involve the improper use of information obtained in the course of clinical trials, which could result in regulatory sanctions, delays in clinical trials, or serious harm to our reputation. We have adopted a code of conduct for our directors, officers and employees, but it is not always possible to identify and deter employee misconduct. The precautions we take to detect and prevent this activity may not be effective in controlling unknown or unmanaged risks or losses or in protecting us from governmental investigations or other actions or lawsuits stemming from a failure to be in compliance with such laws or regulations. If any such actions are instituted against us, and we are not successful in defending ourselves or asserting our rights, those actions could harm our business, results of operations, financial condition and cash flows, including through the imposition of significant fines or other sanctions.

If we fail to comply with environmental, health and safety laws and regulations, we could become subject to fines or penalties or incur costs that could harm our business.

We are subject to numerous environmental, health and safety laws and regulations, including those governing laboratory procedures and the handling, use, storage, treatment and disposal of hazardous materials and wastes. Our operations involve the use of hazardous and flammable materials, including chemicals and biological materials. Our operations also produce hazardous waste products. We contract with third parties for the disposal of these materials and wastes. We cannot eliminate the risk of contamination or injury from these materials. In the event of contamination or injury resulting from our use of hazardous materials, we could be held liable for any resulting damages, and any liability could exceed our resources. We also could incur significant costs associated with civil or criminal fines and penalties for failure to comply with such laws and regulations. We do not maintain insurance for environmental liability or toxic tort claims that may be asserted against us in connection with our storage or disposal of biological, hazardous or radioactive materials.

In addition, we may incur substantial costs in order to comply with current or future environmental, health and safety laws and regulations applicable to our operations in the U.S. and foreign countries. These current or future laws and regulations may impair our research, development or manufacturing efforts. Our failure to comply with these laws and regulations also may result in substantial fines, penalties or other sanctions.

Risks Related to Our International Operations

We are establishing international operations and seeking approval to commercialize our product candidates outside of the U.S., in particular in China, and a number of risks associated with international operations could materially and adversely affect our business.

We expect to be subject to a number of risks related with our international operations, many of which may be beyond our control. These risks include:

- different regulatory requirements for drug approvals in foreign countries;
- different standards of care in various countries that could complicate the evaluation of our product candidates;
- different U.S. and foreign drug import and export rules;
- reduced protection for intellectual property rights in certain countries;

Table of Contents

- · changes in tariffs, trade barriers and regulatory requirements;
- different reimbursement systems and different competitive drugs indicated to treat the indications for which our product candidates are being developed;
- economic weakness, including inflation, or political instability in particular foreign economies and markets;
- · compliance with tax, employment, immigration and labor laws for employees living or traveling abroad;
- compliance with the FCPA, and other anti-corruption and anti-bribery laws;
- U.S. and foreign taxes, including withholding of payroll taxes;
- foreign currency fluctuations, which could result in increased operating expenses and reduced revenues, and other obligations incident to doing business in another country;
- workforce uncertainty in countries where labor unrest is more common than in the U.S.;
- production shortages resulting from any events affecting raw material supply or manufacturing capabilities abroad;
- a reliance on CROs, clinical trial sites, principal investigators and other third parties that may be less experienced with clinical trials or have different methods of performing such clinical trials than we are used to in the U.S.;
- potential liability resulting from development work conducted by foreign distributors; and
- · business interruptions resulting from geopolitical actions, including war and terrorism, or natural disasters.

The pharmaceutical industry in China is highly regulated and such regulations are subject to change.

The pharmaceutical industry in China is subject to comprehensive government regulation and supervision, encompassing the approval, registration, manufacturing, packaging, licensing and marketing of new drugs. Refer to "Business - Government Regulation - Regulation in China" for a discussion of the regulatory requirements that are applicable to our current and planned business activities in China. In recent years, the regulatory framework in China regarding the pharmaceutical industry has undergone significant changes, and we expect that it will continue to undergo significant changes. Any such changes or amendments may result in increased compliance costs on our business or cause delays in or prevent the successful development or commercialization of our product candidates in China. For example, the NMPA recently adopted the International Council for Harmonisation of Technical Requirements for Pharmaceuticals for Human Use guidelines, and accordingly imposed regulatory oversight earlier in our production process for roxadustat manufactured and sold in China. The change in regulatory starting material triggered an extension of the inspection to our contract manufacturer STA, which was successfully completed in October 2018. In addition, Chinese authorities have become increasingly vigilant in enforcing laws in the pharmaceutical industry, in some cases launching industry-wide investigations, oftentimes appearing to focus on foreign companies. The costs and time necessary to respond to an investigation can be material. Any failure by us or our partners to maintain compliance with applicable laws and regulations or obtain and maintain required licenses and permits may result in the suspension or termination of our business activities in China.

We plan to use our own manufacturing facilities in China to produce roxadustat API, roxadustat drug product, and FG-5200 corneal implants. As an organization, we have limited experience in the construction, licensure, and operation of a manufacturing plant, and accordingly we cannot assure you we will be able to meet regulatory requirements to operate our plant and to sell our products.

We have two manufacturing facilities in China, with one located in Beijing and the other in Cangzhou, Hebei. In December 2018, we received the Manufacturing License for Drug Substance and Drug Product for roxadustat and GMP certification for our Beijing facility that allows us to manufacture limited commercial quantities of roxadustat capsules. We are currently planning on manufacturing commercial-scale API at our Cangzhou facility, and expect to receive a license to produce roxadustat API at that site in the second half of 2019. However, as an organization, we have limited experience licensing and operating commercial manufacturing facilities.

We will be obligated to comply with continuing cGMP requirements and there can be no assurance that we will receive and maintain all of the appropriate licenses required to manufacture our product candidates for clinical and commercial use in China. In addition, we and our product suppliers must continually spend time, money and effort in production, record-keeping and quality assurance and appropriate controls in order to ensure that any products manufactured in our facilities meet applicable specifications and other requirements for product safety, efficacy and quality and there can be no assurance that our efforts will succeed for licensure or continue to be successful in meeting these requirements.

Table of Contents

We would require separate approval for the manufacture of FG-5200. In addition, we may convert the existing manufacturing process of FG-5200 to a semi-automated process, which may require us to show that implants from our new manufacturing process are comparable to the implants from our existing manufacturing process. There can be no assurance that we will successfully receive licensure and maintain approval for the manufacture of FG-5200, either of which would be expected to delay or preclude our ability to develop FG-5200 in China and may materially adversely affect our business and operations and prospects in China.

Manufacturing facilities in China are subject to periodic unannounced inspections by the NMPA and other regulatory authorities. We expect to depend on these facilities for our product candidates and business operations in China. Natural disasters or other unanticipated catastrophic events, including power interruptions, water shortages, storms, fires, earthquakes, terrorist attacks, government appropriation of our facilities, and wars, could significantly impair our ability to operate our manufacturing facilities. Certain equipment, records and other materials located in these facilities would be difficult to replace or would require substantial replacement lead time that would impact our ability to successfully commercialize our product candidates in China. The occurrence of any such event could materially and adversely affect our business, financial condition, results of operations, cash flows and prospects.

In addition to manufacturing, we are responsible for pharmacovigilance, medical affairs, and management of the third party distribution logistics for roxadustat in China. We have no experience in these areas as a company, and accordingly we cannot assure you we will be able to meet regulatory requirements or operate in these capacities successfully.

We are responsible for commercial manufacturing, pharmacovigilance, medical affairs, and management of the third party distribution logistics for roxadustat commercial activities in China. While we have been increasing our staffing in these areas, as a company, we have no experience managing or operating these functions for a commercial product and there can be no guarantee that we will do so efficiently or effectively. Mistakes or delays in these areas could limit our ability to successfully commercialize roxadustat in China, could limit our eventual market penetration, sales and profitability, and could subject us to significant liability in China.

Our decision to launch roxadustat in China prior to approval in the U.S. or Europe is largely unprecedented and could be subject to significant risk, delay and expense.*

Even though our subsidiary FibroGen Beijing has received marketing authorization for roxadustat for anemia caused by CKD in dialysis patients, we have not yet received approval in non-dialysis patients, and are awaiting the results from the Chinese authorities' completed inspection of our Phase 3 non-dialysis clinical trial sites.

We are currently expecting non-dialysis patients to be added to our approved dialysis label for roxadustat in China in the third quarter of 2019, and are planning on launching in the third quarter of 2019, however, it is possible that unforeseen delays in the China regulatory process could have a material adverse effect on our development and commercialization of roxadustat in China.

In addition we are required to conduct a 2,000 subject post-approval safety study to demonstrate the long-term safety of roxadustat and conduct intensive drug monitoring in an additional 1,000 patients, as well as provide period reporting to the authorities on GMP and quality compliance at our manufacturing facilities. If safety issues arise in this study, or generally after commercialization, our commercialization plans and profitability in China could be negatively impacted.

We and our collaboration partner in China, AstraZeneca, may experience difficulties in successfully generating sales of roxadustat in China.*

We and AstraZeneca have a profit sharing arrangement with respect to roxadustat in China and any difficulties we may experience in generating sales will affect our bottom line. Difficulties may be related to our ability to obtain reasonable pricing, reimbursement, hospital listing, and tendering, or other difficulties related to distribution, marketing, and sales efforts in China. Sales of roxadustat in China may be limited due to the complex nature of the healthcare system, low average personal income, pricing controls, still developing infrastructure and potentially rapid competition from other products. The government has committed to updating the National Reimbursement Drug List ("NRDL") in 2019. Previous updates to the NRDL occurred in 2017 and 2009. In addition, there were also NRDL price negotiations in 2018 for oncology drugs. Admission to the NRDL depends on a number of factors, including on-market experience, scale of patient adoption, physician endorsement, cost effectiveness and budget impact. Given that roxadustat was approved at the end of 2018, we may or may not qualify for the NRDL update in 2019. In particular, if we are unable to obtain reimbursement for roxadustat through the 2019 update to the NRDL, we may have to wait a substantial period of time before the reimbursement drug list is updated again. Without government reimbursement, many patients will not be able to afford roxadustat, since private commercial health insurance is rare, and our business and operations could be adversely affected. Therefore reimbursement and obtaining hospital listing is critical to roxadustat's near-term commercial success in China.

The market for treatment of anemia in CKD in China is highly competitive.

Although we have now received approval for roxadustat for the treatment of anemia caused by CKD in dialysis patients in China, and even if roxadustat receives approval for anemia caused by CKD in non-dialysis patients, it faces intense competition in the market for treatment of anemia in CKD. Roxadustat would compete with ESAs, which are offered by established multinational pharmaceutical companies such as Kyowa Hakko Kirin China Pharmaceutical Co., Ltd., Roche and Chinese pharmaceutical companies such as 3SBio Inc. and Di'ao Group Chengdu Diao Jiuhong Pharmaceutical Factory. Many of these competitors have substantially greater name recognition, scientific, financial, and marketing resources, as well as established distribution capabilities. Many of our competitors have more resources to develop or acquire, and more experience in developing or acquiring, new products and in creating market awareness for those products. Many of these competitors have significantly more experience than we have in navigating the Chinese regulatory framework regarding the development, manufacturing and marketing of drugs in China, as well as in marketing and selling anemia products in China. Additionally, we believe that most patients with anemia in CKD in China are currently being treated with traditional Chinese medicine, which is widely accepted and highly prevalent in China. Traditional Chinese medicine treatments are often oral and thus convenient and low-cost, and practitioners of traditional Chinese medicine are numerous and accessible in China. As a result, it may be difficult to persuade patients with anemia in CKD to switch from traditional Chinese medicine to roxadustat.

The Chinese government is implementing a new "Two Invoices" regulation which could affect the way we structure our distributorship relationships in China for roxadustat.

The Chinese government is implementing new regulations that impact distribution of pharmaceutical products in China. These regulations generally require that at most two invoices may be issued throughout the distribution chain. Failure to comply with the "Two-Invoices" regulations would prevent us from accessing the market in China. We are planning on modifying the distribution responsibilities under the China Agreement between AstraZeneca and FibroGen such that FibroGen would engage distributors and a third party logistics provider, and both companies will work together to manage the distribution network. FibroGen China Anemia Holdings, Ltd ("FibroGen China") has never managed distribution of pharmaceutical products, and this new distribution structure may impose higher costs or limit or delay our ability to sell products to our principal customers, and may limit the near term sales of our products.

There is no assurance that roxadustat will be included in the Medical Insurance Catalogs.

Eligible participants in the national basic medical insurance program in China, which consists of mostly urban residents, are entitled to reimbursement from the social medical insurance fund for up to the entire cost of medicines that are included in the Medical Insurance Catalogs. Refer to "Business - Government Regulation - Regulation in China." We believe that the inclusion of a drug in the Medical Insurance Catalogs can substantially improve the sales of a drug in China. The Ministry of Labor and Social Security in China ("MLSS") together with other government authorities, select medicines to be included in the Medical Insurance Catalogs based on a variety of factors, including treatment requirements, frequency of use, effectiveness and price. The MLSS also occasionally removes medicines from such catalogs. There can be no assurance that roxadustat will be included, and once included, remain in the Medical Insurance Catalogs. The exclusion or removal of roxadustat from the Medical Insurance Catalogs may materially and adversely affect sales of roxadustat.

Even if FG-5200 can be manufactured successfully and achieve regulatory approval, we may not achieve commercial success.

We have not yet received a license to manufacture FG-5200 in our Beijing manufacturing facility or at scale, and we will have to show that FG-5200 produced in our China manufacturing facility meets the applicable regulatory requirements. There can be no assurance that we can meet these requirements or that FG-5200 can be approved for development, manufacture and sale in China.

Even if we are able to manufacture and develop FG-5200 as a medical device in China, the size and length of any potential clinical trials required for approval are uncertain and we are unable to predict the time and investment required to obtain regulatory approval. Moreover, even if FG-5200 can be successfully developed for approval in China, our product candidate would require extensive training and investment in assisting physicians in the use of FG-5200.

The retail prices of any product candidates that we develop may be subject to control, including periodic downward adjustment, by Chinese government authorities.

The price for pharmaceutical products is highly regulated in China, both at the national and provincial level. Price controls may reduce prices to levels significantly below those that would prevail in less regulated markets, or limit the volume of products that may be sold, either of which may have a material and adverse effect on potential revenues from sales of roxadustat in China. Moreover, the process and timing for the implementation of price restrictions is unpredictable, which may cause potential revenues from the sales of roxadustat to fluctuate from period to period.

If our planned business activities in China fall within a restricted category under the China Catalog for Guidance for Foreign Investment, we will need to operate in China through a variable interest entity ("VIE") structure.

The China Catalog for Guidance for Foreign Investment sets forth the industries and sectors that the Chinese government encourages and restricts with respect to foreign investment and participation. The Catalog for Guidance for Foreign Investment is subject to revision from time to time by the China Ministry of Commerce. While we currently do not believe the development and marketing of roxadustat falls within a restricted category under the Catalog for Guidance for Foreign Investment, if roxadustat does fall under such a restricted category, we will need to operate in China through a VIE structure. A VIE structure involves a wholly foreign-owned enterprise that would control and receive the economic benefits of a domestic Chinese company through various contractual relationships. Such a structure would subject us to a number of risks that may have an adverse effect on our business, including that the Chinese government may determine that such contractual arrangements do not comply with applicable regulations, Chinese tax authorities may require us to pay additional taxes, shareholders of our VIEs may have potential conflicts of interest with us, and we may lose the ability to use and enjoy assets held by our VIEs that are important to the operations of our business if such entities go bankrupt or become subject to dissolution or liquidation proceedings. VIE structures in China have come under increasing scrutiny from accounting firms and the Securities and Exchange Commission ("SEC") staff. If we do attempt to use a VIE structure and are unsuccessful in structuring it so as to qualify as a VIE, we would not be able to consolidate the financial statements of the VIE with our financial statements, which could have a material adverse effect on our operating results and financial condition.

FibroGen Beijing would be subject to restrictions on paying dividends or making other payments to us, which may restrict our ability to satisfy our liquidity requirements.

We plan to conduct all of our business in China through FibroGen China and FibroGen Beijing. We may rely on dividends and royalties paid by FibroGen Beijing for a portion of our cash needs, including the funds necessary to service any debt we may incur and to pay our operating expenses. The payment of dividends by FibroGen Beijing is subject to limitations. Regulations in China currently permit payment of dividends only out of accumulated profits as determined in accordance with accounting standards and regulations in China. FibroGen Beijing is not permitted to distribute any profits until losses from prior fiscal years have been recouped and in any event must maintain certain minimum capital requirements. FibroGen Beijing is also required to set aside at least 10.0% of its after-tax profit based on Chinese accounting standards each year to its statutory reserve fund until the cumulative amount of such reserves reaches 50.0% of its registered capital. Statutory reserves are not distributable as cash dividends. In addition, if FibroGen Beijing incurs debt on its own behalf in the future, the agreements governing such debt may restrict its ability to pay dividends or make other distributions to us. As of June 30, 2019, approximately \$5.1 million of our cash and cash equivalents is held in China.

Any capital contributions from us to FibroGen Beijing must be approved by the Ministry of Commerce in China, and failure to obtain such approval may materially and adversely affect the liquidity position of FibroGen Beijing.

The Ministry of Commerce in China or its local counterpart must approve the amount and use of any capital contributions from us to FibroGen Beijing, and there can be no assurance that we will be able to complete the necessary government registrations and obtain the necessary government approvals on a timely basis, or at all. If we fail to do so, we may not be able to contribute additional capital to fund our Chinese operations, and the liquidity and financial position of FibroGen Beijing may be materially and adversely affected.

We may be subject to currency exchange rate fluctuations and currency exchange restrictions with respect to our operations in China, which could adversely affect our financial performance.

If roxadustat is approved for sale in China, most of our product sales will occur in local Chinese currency and our operating results will be subject to volatility from currency exchange rate fluctuations. To date, we have not hedged against the risks associated with fluctuations in exchange rates and, therefore, exchange rate fluctuations could have an adverse impact on our future operating results. Changes in value of the Renminbi against the U.S. dollar, Euro and other currencies is affected by, among other things, changes in China's political and economic conditions. Currently, the Renminbi is permitted to fluctuate within a narrow and managed band against a basket of certain foreign currencies. Any significant currency exchange rate fluctuations may have a material adverse effect on our business and financial condition.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 92 of 1730

Table of Contents

In addition, the Chinese government imposes controls on the convertibility of the Renminbi into foreign currencies and the remittance of foreign currency out of China for certain transactions. Shortages in the availability of foreign currency may restrict the ability of FibroGen Beijing to remit sufficient foreign currency to pay dividends or other payments to us, or otherwise satisfy their foreign currency-denominated obligations. Under existing Chinese foreign exchange regulations, payments of current account items, including profit distributions, interest payments and balance of trade, can be made in foreign currencies without prior approval from the State Administration of Foreign Exchange ("SAFE") by complying with certain procedural requirements. However, approval from SAFE or its local branch is required where Renminbi is to be converted into foreign currency and remitted out of China to pay capital expenses such as the repayment of loans denominated in foreign currencies. The Chinese government may also at its discretion restrict access in the future to foreign currencies for current account transactions. If the foreign exchange control system prevents us from obtaining sufficient foreign currency to satisfy our operational requirements, our liquidity and financial position may be materially and adversely affected.

Because FibroGen Beijing's funds are held in banks that do not provide insurance, the failure of any bank in which FibroGen Beijing deposits its funds could adversely affect our business.

Banks and other financial institutions in China do not provide insurance for funds held on deposit. As a result, in the event of a bank failure, FibroGen Beijing may not have access to funds on deposit. Depending upon the amount of money FibroGen Beijing maintains in a bank that fails, its inability to have access to cash could materially impair its operations.

We may be subject to tax inefficiencies associated with our offshore corporate structure.

The tax regulations of the U.S. and other jurisdictions in which we operate are extremely complex and subject to change. New laws, new interpretations of existing laws, such as the Base Erosion Profit Shifting project initiated by the Organization for Economic Co-operation and Development, and any legislation proposed by the relevant taxing authorities, or limitations on our ability to structure our operations and intercompany transactions may lead to inefficient tax treatment of our revenue, profits, royalties, and distributions, if any are achieved.

In addition, we and our foreign subsidiaries have various intercompany transactions. We may not be able to obtain certain benefits under relevant tax treaties to avoid double taxation on certain transactions among our subsidiaries. If we are not able to avail ourselves to the tax treaties, we could be subject to additional taxes, which could adversely affect our financial condition and results of operations.

On December 22, 2017, the U.S. enacted the Tax Cuts and Jobs Act ("Tax Act") that instituted fundamental changes to the taxation of multinational corporations. The Tax Act includes changes to the taxation of foreign earnings by implementing a dividend exemption system, expansion of the current anti-deferral rules, a minimum tax on low-taxed foreign earnings and new measures to deter base erosion. The Tax Act also includes a permanent reduction in the corporate tax rate to 21%, repeal of the corporate alternative minimum tax, expensing of capital investment, and limitation of the deduction for interest expense. Furthermore, as part of the transition to the new tax system, a one-time transition tax is imposed on a U.S. shareholder's historical undistributed earnings of foreign affiliates. Although the Tax Act is generally effective January 1, 2018, GAAP requires recognition of the tax effects of new legislation during the reporting period that includes the enactment date, which was December 22, 2017.

As a result of the impacts of the Tax Act, the SEC provided guidance that allows us to record provisional amounts for those impacts, with the requirement that the accounting be completed in a period not to exceed one year from the date of enactment. As of December 31, 2018, we completed our analysis of the accounting for the tax effects of the Tax Act and no material adjustments were recognized as of December 31, 2018. The primary impact of the Tax Act relates to the re-measurement of deferred tax assets and liabilities resulting from the change in the corporate tax rate ("Corporate Tax Rate Change"), which was recorded as of December 2017. Developing interpretations of the provisions of the Tax Act, changes to U.S. Treasury regulations, administrative interpretations, or court decisions interpreting the Tax Act in the future periods may require further adjustments to our analysis.

Table of Contents

Our foreign operations, particularly those in China, are subject to significant risks involving the protection of intellectual property.

We seek to protect the products and technology that we consider important to our business by pursuing patent applications in China and other countries, relying on trade secrets or pharmaceutical regulatory protection or employing a combination of these methods. We note that the filing of a patent application does not mean that we will be granted a patent, or that any patent eventually granted will be as broad as requested in the patent application or will be sufficient to protect our technology. There are a number of factors that could cause our patents, if granted, to become invalid or unenforceable or that could cause our patent applications not to be granted, including known or unknown prior art, deficiencies in the patent application, or lack of originality of the technology. Furthermore, the terms of our patents are limited. The patents we hold and the patents that may be granted from our currently pending patent applications have, absent any patent term adjustment or extension, a twenty-year protection period starting from the date of application.

Intellectual property rights and confidentiality protections in China may not be as effective as those in the U.S. or other countries for many reasons, including lack of procedural rules for discovery and evidence, low damage awards, and lack of judicial independence. Implementation and enforcement of China intellectual property laws have historically been deficient and ineffective and may be hampered by corruption and local protectionism. Policing unauthorized use of proprietary technology is difficult and expensive, and we may need to resort to litigation to enforce or defend patents issued to us or to determine the enforceability and validity of our proprietary rights or those of others. The experience and capabilities of China courts in handling intellectual property litigation varies and outcomes are unpredictable. An adverse determination in any such litigation could materially impair our intellectual property rights and may harm our business.

We are subject to laws and regulations governing corruption, which will require us to develop, maintain, and implement costly compliance programs.

We must comply with a wide range of laws and regulations to prevent corruption, bribery, and other unethical business practices, including the FCPA, anti-bribery and anti-corruption laws in other countries, particularly China. The creation and implementation of international business practices compliance programs is costly and such programs are difficult to enforce, particularly where reliance on third parties is required.

Anti-bribery laws prohibit us, our employees, and some of our agents or representatives from offering or providing any personal benefit to covered government officials to influence their performance of their duties or induce them to serve interests other than the missions of the public organizations in which they serve. Certain commercial bribery rules also prohibit offering or providing any personal benefit to employees and representatives of commercial companies to influence their performance of their duties or induce them to serve interests other than their employers. The FCPA also obligates companies whose securities are listed in the U.S. to comply with certain accounting provisions requiring us to maintain books and records that accurately and fairly reflect all transactions of the corporation, including international subsidiaries, and devise and maintain an adequate system of internal accounting controls for international operations. The anti-bribery provisions of the FCPA are enforced primarily by the Department of Justice. The SEC is involved with enforcement of the books and records provisions of the FCPA.

Compliance with these anti-bribery laws is expensive and difficult, particularly in countries in which corruption is a recognized problem. In addition, the anti-bribery laws present particular challenges in the pharmaceutical industry because in many countries including China, hospitals are state-owned or operated by the government, and doctors and other hospital employees are considered foreign government officials. Furthermore, in certain countries (China in particular), hospitals and clinics are permitted to sell pharmaceuticals to their patients and are primary or significant distributors of pharmaceuticals. Certain payments to hospitals in connection with clinical studies, procurement of pharmaceuticals and other work have been deemed to be improper payments to government officials that have led to vigorous anti-bribery law enforcement actions and heavy fines in multiple jurisdictions, particularly in the U.S. and China.

It is not always possible to identify and deter violations, and the precautions we take to detect and prevent this activity may not be effective in controlling unknown or unmanaged risks or losses or in protecting us from governmental investigations or other actions or lawsuits stemming from a failure to be in compliance with such laws or regulations.

Table of Contents

In the pharmaceutical industry, corrupt practices include, among others, acceptance of kickbacks, bribes or other illegal gains or benefits by the hospitals and medical practitioners from pharmaceutical manufacturers, distributors or their third party agents in connection with the prescription of certain pharmaceuticals. If our employees, affiliates, distributors or third party marketing firms violate these laws or otherwise engage in illegal practices with respect to their sales or marketing of our products or other activities involving our products, we could be required to pay damages or heavy fines by multiple jurisdictions where we operate, which could materially and adversely affect our financial condition and results of operations. The Chinese government has also sponsored anti-corruption campaigns from time to time, which could have a chilling effect on any future marketing efforts by us to new hospital customers. There have been recent occurrences in which certain hospitals have denied access to sales representatives from pharmaceutical companies because the hospitals wanted to avoid the perception of corruption. If this attitude becomes widespread among our potential customers, our ability to promote our products to hospitals may be adversely affected.

As we expand our operations in China and other jurisdictions internationally, we will need to increase the scope of our compliance programs to address the risks relating to the potential for violations of the FCPA and other anti-bribery and anti-corruption laws. Our compliance programs will need to include policies addressing not only the FCPA, but also the provisions of a variety of anti-bribery and anti-corruption laws in multiple foreign jurisdictions, including China, provisions relating to books and records that apply to us as a public company, and include effective training for our personnel throughout our organization. The creation and implementation of anti-corruption compliance programs is costly and such programs are difficult to enforce, particularly where reliance on third parties is required. Violation of the FCPA and other anti-corruption laws can result in significant administrative and criminal penalties for us and our employees, including substantial fines, suspension or debarment from government contracting, prison sentences, or even the death penalty in extremely serious cases in certain countries. The SEC also may suspend or bar us from trading securities on U.S. exchanges for violation of the FCPA's accounting provisions. Even if we are not ultimately punished by government authorities, the costs of investigation and review, distraction of our personnel, legal defense costs, and harm to our reputation could be substantial and could limit our profitability or our ability to develop or commercialize our product candidates. In addition, if any of our competitors are not subject to the FCPA, they may engage in practices that will lead to their receipt of preferential treatment from foreign hospitals and enable them to secure business from foreign hospitals in ways that are unavailable to us.

Uncertainties with respect to the China legal system could have a material adverse effect on us.

The legal system of China is a civil law system primarily based on written statutes. Unlike in a common law system, prior court decisions may be cited for reference but are not binding. Because the China legal system continues to rapidly evolve, the interpretations of many laws, regulations and rules are not always uniform and enforcement of these laws, regulations and rules involve uncertainties, which may limit legal protections available to us. Moreover, decision makers in the China judicial system have significant discretion in interpreting and implementing statutory and contractual terms, which may render it difficult for FibroGen Beijing to enforce the contracts it has entered into with our business partners, customers and suppliers. Different government departments may have different interpretations of certain laws and regulations, and licenses and permits issued or granted by one government authority may be revoked by a higher government authority at a later time. Navigating the uncertainty and change in the China legal system will require the devotion of significant resources and time, and there can be no assurance that our contractual and other rights will ultimately be enforced.

Changes in China's economic, political or social conditions or government policies could have a material adverse effect on our business and operations.*

Chinese society and the Chinese economy continue to undergo significant change. Changes in the regulatory structure, regulations, and economic policies of the Chinese government could have a material adverse effect on the overall economic growth of China, which could adversely affect our ability to conduct business in China. The Chinese government continues to adjust economic policies to promote economic growth. Some of these measures benefit the overall Chinese economy, but may also have a negative effect on us. For example, our financial condition and results of operations in China may be adversely affected by government control over capital investments or changes in tax regulations. As the Chinese pharmaceutical industry grows and evolves, the Chinese government may also implement measures to change the regulatory structure and structure of foreign investment in this industry. We are unable to predict the frequency and scope of such policy changes and structural changes, any of which could materially and adversely affect FibroGen Beijing's development and commercialization timelines, liquidity, access to capital, and its ability to conduct business in China. Any failure on our part to comply with changing government regulations and policies could result in the loss of our ability to develop and commercialize our product candidates in China. In addition, the changing government regulations and policies could result in delays and cost increases to our development, manufacturing, approval, and commercialization timelines in China.

Our operations in China subject us to various Chinese labor and social insurance laws, and our failure to comply with such laws may materially and adversely affect our business, financial condition and results of operations.

We are subject to China Labor Contract Law, which provides strong protections for employees and imposes many obligations on employers. The Labor Contract Law places certain restrictions on the circumstances under which employers may terminate labor contracts and require economic compensation to employees upon termination of employment, among other things. In addition, companies operating in China are generally required to contribute to labor union funds and the mandatory social insurance and housing funds. Any failure by us to comply with Chinese labor and social insurance laws may subject us to late fees, fines and penalties, or cause the suspension or termination of our ability to conduct business in China, any of which could have a material and adverse effect on business, results of operations and prospects.

Recent developments relating to the United Kingdom's referendum vote in favor of leaving the EU could adversely affect us.

The United Kingdom held a referendum on June 23, 2016 in which a majority voted for the United Kingdom's withdrawal from the EU, commonly referred to as "Brexit". As a result of this vote, negotiations are expected to commence to determine the terms of the United Kingdom's withdrawal from the EU as well as its relationship with the EU going forward, including the terms of trade between the United Kingdom and the EU. The effects of the United Kingdom's withdrawal from the EU, and the perceptions as to its impact, are expected to be far-reaching and may adversely affect business activity and economic conditions in Europe and globally and could continue to contribute to instability in global financial markets, including foreign exchange markets. The United Kingdom's withdrawal from the EU could also have the effect of disrupting the free movement of goods, services and people between the United Kingdom and the EU and could also lead to legal uncertainty and potentially divergent national laws and regulations as the United Kingdom determines which EU laws to replace or replicate, including laws that could impact our ability, or our collaborator's ability in the case of roxadustat, to obtain approval of our products or sell our products in the United Kingdom. However, the full effects of such withdrawal are uncertain and will depend on any agreements the United Kingdom may make to retain access to EU markets. Lastly, as a result of the United Kingdom's withdrawal from the EU, other European countries may seek to conduct referenda with respect to their continuing membership with the EU. Given these possibilities and others we may not anticipate, as well as the lack of comparable precedent, the full extent to which our business, results of operations and financial condition could be adversely affected by the United Kingdom's withdrawal from the EU is uncertain

Risks Related to the Operation of Our Business

We may encounter difficulties in managing our growth and expanding our operations successfully.

As we seek to advance our product candidates through clinical trials and commercialization, we will need to expand our development, regulatory, manufacturing, commercialization and administration capabilities or contract with third parties to provide these capabilities for us. As our operations expand and we continue to undertake the efforts and expense to operate as a public reporting company, we expect that we will need to increase the responsibilities on members of management in order to manage any future growth effectively. Our failure to accomplish any of these steps could prevent us from successfully implementing our strategy and maintaining the confidence of investors in our Company.

If we fail to attract and keep senior management and key personnel, in particular our chief executive officer, we may be unable to successfully develop our product candidates, conduct our clinical trials and commercialize our product candidates.

We are highly dependent on our chief executive officer, Thomas B. Neff, and other members of our senior management team. The loss of the services of Mr. Neff or any of these other individuals would be expected to significantly negatively impact the development and commercialization of our product candidates, our existing collaborative relationships and our ability to successfully implement our business strategy.

Recruiting and retaining qualified commercial, development, scientific, clinical, and manufacturing personnel are and will continue to be critical to our success, particularly as we expand our commercialization operations. Furthermore, replacing executive officers and key employees may be difficult and may take an extended period of time because of the limited number of individuals in our industry with the breadth of skills and experience required to successfully develop, gain regulatory approval of and commercialize product candidates. We may be unable to hire, train, retain or motivate these key personnel on acceptable terms given the intense competition among numerous biopharmaceutical companies for similar personnel.

There is also significant competition, in particular in the San Francisco Bay Area, for the hiring of experienced and qualified personnel, which increases the importance of retention of our existing personnel. If we are unable to continue to attract and retain personnel with the quality and experience applicable to our product candidates, our ability to pursue our strategy will be limited and our business and operations would be adversely affected.

If product liability lawsuits are brought against us, we may incur substantial liabilities and may be required to limit commercialization of our product candidates.

We face an inherent risk of product liability as a result of the clinical testing, manufacturing and commercialization of our product candidates. Any such product liability claims may include allegations of defects in manufacturing, defects in design, a failure to warn of dangers inherent in a product, negligence, strict liability or breach of warranty. Claims could also be asserted under state consumer protection acts. If we are unable to obtain insurance coverage at levels that are appropriate to maintain our business and operations, or if we are unable to successfully defend ourselves against product liability claims, we may incur substantial liabilities or otherwise cease operations. Product liability claims may result in:

- · termination of further development of unapproved product candidates or significantly reduced demand for any approved products;
- material costs and expenses to defend the related litigation;
- a diversion of time and resources across the entire organization, including our executive management;
- product recalls, withdrawals or labeling restrictions;
- · termination of our collaboration relationships or disputes with our collaboration partners; and
- reputational damage negatively impacting our other product candidates in development.

If we fail to obtain and retain sufficient product liability insurance at an acceptable cost to protect against potential product liability claims, we may not be able to continue to develop our product candidates. We maintain product liability insurance in a customary amount for the stage of development of our product candidates. Although we believe that we have sufficient coverage based on the advice of our third party advisors, there can be no assurance that such levels will be sufficient for our needs. Moreover, our insurance policies have various exclusions, and we may be in a dispute with our carrier as to the extent and nature of our coverage, including whether we are covered under the applicable product liability policy. If we are not able to ensure coverage or are required to pay substantial amounts to settle or otherwise contest the claims for product liability, our business and operations would be negatively affected.

Our business and operations would suffer in the event of computer system failures.

Despite the implementation of security measures, our internal computer systems, and those of our CROs, collaboration partners, and other third parties on which we rely, are vulnerable to damage from computer viruses, unauthorized access, natural disasters, fire, terrorism, war and telecommunication and electrical failures. We upgraded our disaster and data recovery capabilities in June 2017, however, to the extent that any disruption or security breach, in particular with our partners' operations, results in a loss of, or damage to, our data or applications, or inappropriate disclosure of confidential or proprietary information, we could incur liability and it could result in a material disruption and delay of our drug development programs. For example, the loss of clinical trial data from completed, ongoing or planned clinical trials could result in delays in our regulatory approval efforts and significantly increase our costs to recover or reproduce the data.

We depend on sophisticated information technology systems to operate our business and a cyber-attack or other breach of these systems could have a material adverse effect on our business.

We rely on information technology systems to process, transmit and store electronic information in our day-to-day operations. The size and complexity of our information technology systems makes them vulnerable to a cyber-attack, malicious intrusion, breakdown, destruction, loss of data privacy or other significant disruption. While we have recently upgraded our disaster data recovery program, a successful attack could result in the theft or destruction of intellectual property, data, or other misappropriation of assets, or otherwise compromise our confidential or proprietary information and disrupt our operations. Cyber-attacks are becoming more sophisticated and frequent. We have invested in our systems and the protection and recoverability of our data to reduce the risk of an intrusion or interruption, and we monitor and test our systems on an ongoing basis for any current or potential threats. There can be no assurance that these measures and efforts will prevent future interruptions or breakdowns. If we fail to maintain or protect our information technology systems and data integrity effectively or fail to anticipate, plan for or manage significant disruptions to these systems, we could have difficulty preventing, detecting and controlling such cyber-attacks and any such attacks could result in losses described above as well as disputes with physicians, patients and our partners, regulatory sanctions or penalties, increases in operating expenses, expenses or lost revenues or other adverse consequences, any of which could have a material adverse effect on our business, results of operations, financial condition, prospects and cash flows.

Our headquarters and data storage facilities are located near known earthquake fault zones. The occurrence of an earthquake, fire or any other catastrophic event could disrupt our operations or the operations of third parties who provide vital support functions to us, which could have a material adverse effect on our business, results of operations and financial condition.

We and some of the third party service providers on which we depend for various support functions, such as data storage, are vulnerable to damage from catastrophic events, such as power loss, natural disasters, terrorism and similar unforeseen events beyond our control. Our corporate headquarters and other facilities are located in the San Francisco Bay Area, which in the past has experienced severe earthquakes and fires.

We do not carry earthquake insurance. Earthquakes or other natural disasters could severely disrupt our operations, and have a material adverse effect on our business, results of operations, financial condition and prospects.

If a natural disaster, power outage or other event occurred that prevented us from using all or a significant portion of our headquarters, damaged critical infrastructure, or otherwise disrupted operations, it may be difficult or, in certain cases, impossible for us to continue our business for a substantial period of time. The disaster recovery and business continuity plans we have in place are unlikely to provide adequate protection in the event of a serious disaster or similar event. We may incur substantial expenses as a result of the limited nature of our disaster recovery and business continuity plans, which, particularly when taken together with our lack of earthquake insurance, could have a material adverse effect on our business.

Furthermore, integral parties in our supply chain are operating from single sites, increasing their vulnerability to natural disasters or other sudden, unforeseen and severe adverse events. If such an event were to affect our supply chain, it could have a material adverse effect on our business.

Risks Related to Our Common Stock

The market price of our common stock may be highly volatile, and you may not be able to resell your shares at or above your purchase price.

In general, pharmaceutical, biotechnology and other life sciences company stocks have been highly volatile in the current market. The volatility of pharmaceutical, biotechnology and other life sciences company stocks is sometimes unrelated to the operating performance of particular companies and biotechnology and life science companies stocks often respond to trends and perceptions rather than financial performance. In particular, the market price of shares of our common stock could be subject to wide fluctuations in response to the following factors:

- results of clinical trials of our product candidates, including roxadustat and pamrevlumab;
- the timing of the release of results of and regulatory updates regarding our clinical trials;
- the level of expenses related to any of our product candidates or clinical development programs;
- results of clinical trials of our competitors' products;
- safety issues with respect to our product candidates or our competitors' products;
- regulatory actions with respect to our product candidates and any approved products or our competitors' products;
- fluctuations in our financial condition and operating results, which will be significantly affected by the manner in which we recognize revenue from the achievement of milestones under our collaboration agreements;
- adverse developments concerning our collaborations and our manufacturers;
- the termination of a collaboration or the inability to establish additional collaborations;
- the publication of research reports by securities analysts about us or our competitors or our industry or negative recommendations or withdrawal of research coverage by securities analysts;
- the inability to obtain adequate product supply for any approved drug product or inability to do so at acceptable prices;
- disputes or other developments relating to proprietary rights, including patents, litigation matters and our ability to obtain patent protection for our technologies;
- the ineffectiveness of our internal controls;
- our failure or the failure of our competitors to meet analysts' projections or guidance that we or our competitors may give to the market;

Table of Contents

- additions and departures of key personnel;
- announced strategic decisions by us or our competitors;
- · changes in legislation or other regulatory developments affecting our product candidates or our industry;
- fluctuations in the valuation of the biotechnology industry and particular companies perceived by investors to be comparable to us;
- sales of our common stock by us, our insiders or our other stockholders;
- speculation in the press or investment community;
- announcement or expectation of additional financing efforts;
- announcements of investigations or regulatory scrutiny of our operations or lawsuits filed against us;
- changes in accounting principles;
- activities of the government of China, including those related to the pharmaceutical industry as well as industrial policy generally;
- performance of other U.S. publicly traded companies with significant operations in China;
- terrorist acts, acts of war or periods of widespread civil unrest;
- natural disasters such as earthquakes and other calamities;
- changes in market conditions for biopharmaceutical stocks;
- changes in general market and economic conditions; and
- the other factors described in this "Risk Factors" section.

As a result of fluctuations caused by these and other factors, comparisons of our operating results across different periods may not be accurate indicators of our future performance. Any fluctuations that we report in the future may differ from the expectations of market analysts and investors, which could cause the price of our common stock to fluctuate significantly. Moreover, securities class action litigation has often been initiated against companies following periods of volatility in their stock price. This type of litigation could result in substantial costs and divert our management's attention and resources, and could also require us to make substantial payments to satisfy judgments or to settle litigation.

We have broad discretion in the use of the remaining net proceeds from our underwritten public offerings of common stock completed on April 11, 2017 (the "April 2017 Offering") and August 24, 2017 (the "August 2017 Offering") and may not use them effectively.

The net proceeds from the April 2017 Offering is intended to be used to fund the expansion of product development in China, including developing roxadustat in additional indications beyond CKD, manufacturing and commercialization activities, as well as for general corporate purposes. The net proceeds from the August 2017 Offering is intended to be used to fund the expansion of product development, including our development of pamrevlumab through Phase 3 trials, manufacturing and commercialization activities, as well as for general corporate purposes. These general corporate purposes, may include, among other things, funding research and development, clinical trials, vendor payables, potential regulatory submissions, hiring additional personnel and capital expenditures. However, we have no current commitments or obligations to use the net proceeds in the manner described above. Our management has broad discretion in the application of the remaining net proceeds from the April 2017 Offering and the August 2017 Offering, and could spend the remaining net proceeds in ways our stockholders may not agree with or that fails to improve our business or enhance the value of our common stock. The failure by our management to use these funds effectively could result in financial losses that could harm our business, cause the price of our common stock to decline and delay the development of our product candidates.

If securities or industry analysts do not continue to publish research or reports about our business, or if they change their recommendations regarding our stock adversely, our stock price and trading volume could decline.

The trading market for our common stock will be influenced by the research and reports that industry or securities analysts publish about us or our business. If one or more of the analysts who cover us downgrade our stock, our stock price would likely decline. If one or more of these analysts cease coverage of our Company or fail to regularly publish reports on us, we could lose visibility in the financial markets, which in turn could cause our stock price or trading volume to decline.

Our principal stockholders and management own a significant percentage of our stock and will be able to exercise significant influence over matters subject to stockholder approval.*

As of July 31, 2019, our executive officers, directors and principal stockholders, together with their respective affiliates, owned approximately 39.03% of our common stock, including shares subject to outstanding options that are exercisable within 60 days after such date and shares issuable upon settlement of restricted stock units that will vest within 60 days after such date. This percentage is based upon information supplied by officers, directors and principal stockholders and Schedules 13D and 13G, if any, filed with the SEC, which information may not be accurate as of April 30, 2019. Accordingly, these stockholders will be able to exert a significant degree of influence over our management and affairs and over matters requiring stockholder approval, including the election of our board of directors and approval of significant corporate transactions. The interests of this group may differ from those of other stockholders and they may vote their shares in a way that is contrary to the way other stockholders vote their shares. This concentration of ownership could have the effect of entrenching our management and/or the board of directors, delaying or preventing a change in our control or otherwise discouraging a potential acquirer from attempting to obtain control of us, which in turn could have a material and adverse effect on the fair market value of our common stock.

Additional remedial measures that may be imposed in the proceedings instituted by the SEC against five China based accounting firms, including the Chinese affiliate of our independent registered public accounting firm, could result in our consolidated financial statements being determined to not be in compliance with the requirements of the Exchange Act.

In late 2012, the SEC commenced administrative proceedings under Rule 102(e) of its Rules of Practice and also under the Sarbanes-Oxley Act of 2002 against the Chinese affiliates of the "big four" accounting firms, including PricewaterhouseCoopers Zhong Tian CPAs Limited, the Chinese affiliate of our independent registered public accounting firm. The Rule 102(e) proceedings initiated by the SEC relate to these firms' failure to produce documents, including audit work papers, in response to the request of the SEC pursuant to Section 106 of the Sarbanes-Oxley Act of 2002, as the auditors located in China are not in a position lawfully to produce documents directly to the SEC because of restrictions under Chinese law and specific directives issued by the China Securities Regulatory Commission ("CSRC"). The issues raised by the proceedings are not specific to our auditors or to us.

In January 2014, an administrative law judge reached an initial decision that the Chinese affiliates of the "big four" accounting firms should be barred from practicing before the SEC for a period of six months. In February 2015, the Chinese affiliates of the "big four" accounting firms each agreed to a censure and to pay a fine to the SEC to settle the dispute and avoid suspension of their ability to practice before the SEC and audit U.S.-listed companies. The settlement required the firms to follow detailed procedures and to seek to provide the SEC with access to Chinese firms' audit documents via the CSRC. If future document productions fail to meet specified criteria, the SEC retains authority to impose a variety of additional remedial measures on the firms depending on the nature of the failure.

We cannot predict if the SEC will further review the four firms' compliance with specified criteria or if such further review would result in the SEC imposing additional penalties such as suspensions or commencing any further administrative proceedings. Although it does not play a substantial role (as defined under PCAOB standards) in the audit of our consolidated financial statements, if PricewaterhouseCoopers Zhong Tian CPAs Limited were denied, temporarily, the ability to practice before the SEC, our ability to produce audited consolidated financial statements for our Company could be affected and we could be determined not to be in compliance with the requirements of the Exchange Act. Such a determination could ultimately lead to the delisting of our shares from the Nasdaq Global Select Market or deregistration from the SEC, or both, which would substantially reduce or effectively terminate the trading of our stock.

We may engage in future acquisitions that could disrupt our business, cause dilution to our stockholders and harm our business, results of operations, financial condition and cash flows and future prospects.

While we currently have no specific plans to acquire any other businesses, we may, in the future, make acquisitions of, or investments in, companies that we believe have products or capabilities that are a strategic or commercial fit with our present or future product candidates and business or otherwise offer opportunities for our Company. In connection with these acquisitions or investments, we may:

- issue stock that would dilute our existing stockholders' percentage of ownership;
- incur debt and assume liabilities; and
- incur amortization expenses related to intangible assets or incur large and immediate write-offs.

Table of Contents

We may not be able to complete acquisitions on favorable terms, if at all. If we do complete an acquisition, we cannot assure you that it will ultimately strengthen our competitive position or that it will be viewed positively by customers, financial markets or investors. Furthermore, future acquisitions could pose numerous additional risks to our operations, including:

- · problems integrating the purchased business, products or technologies, or employees or other assets of the acquisition target;
- · increases to our expenses;
- disclosed or undisclosed liabilities of the acquired asset or company;
- diversion of management's attention from their day-to-day responsibilities;
- reprioritization of our development programs and even cessation of development and commercialization of our current product candidates;
- · harm to our operating results or financial condition;
- entrance into markets in which we have limited or no prior experience; and
- potential loss of key employees, particularly those of the acquired entity.

We may not be able to complete any acquisitions or effectively integrate the operations, products or personnel gained through any such acquisition.

Provisions in our charter documents and Delaware law may have anti-takeover effects that could discourage an acquisition of us by others, even if an acquisition would be beneficial to our stockholders, and may prevent attempts by our stockholders to replace or remove our current directors or management.

Provisions in our amended and restated certificate of incorporation and amended and restated bylaws contain provisions that may have the effect of discouraging, delaying or preventing a change in control of us or changes in our management. These provisions could also limit the price that investors might be willing to pay in the future for shares of our common stock, thereby depressing the market price of our common stock. In addition, because our board of directors is responsible for appointing the members of our management team, these provisions may frustrate or prevent any attempts by our stockholders to replace or remove our current management by making it more difficult for stockholders to replace members of our board of directors. Among other things, these provisions:

- authorize "blank check" preferred stock, which could be issued by our board of directors without stockholder approval and may contain voting, liquidation, dividend and other rights superior to our common stock;
- · create a classified board of directors whose members serve staggered three-year terms;
- specify that special meetings of our stockholders can be called only by our board of directors pursuant to a resolution adopted by a
 majority of the total number of directors;
- prohibit stockholder action by written consent;
- establish an advance notice procedure for stockholder approvals to be brought before an annual meeting of our stockholders, including proposed nominations of persons for election to our board of directors;
- provide that our directors may be removed prior to the end of their term only for cause;
- provide that vacancies on our board of directors may be filled only by a majority of directors then in office, even though less than a quorum:
- require a supermajority vote of the holders of our common stock or the majority vote of our board of directors to amend our bylaws;
 and
- require a supermajority vote of the holders of our common stock to amend the classification of our board of directors into three classes and to amend certain other provisions of our certificate of incorporation.

These provisions, alone or together, could delay or prevent hostile takeovers and changes in control or changes in our management by making it more difficult for stockholders to replace members of our board of directors, which is responsible for appointing the members of our management.

Table of Contents

Moreover, because we are incorporated in Delaware, we are governed by certain anti-takeover provisions under Delaware law which may discourage, delay or prevent someone from acquiring us or merging with us whether or not it is desired by or beneficial to our stockholders. We are subject to the provisions of Section 203 of the Delaware General Corporation Law, which prohibits a person who owns in excess of 15% of our outstanding voting stock from merging or combining with us for a period of three years after the date of the transaction in which the person acquired in excess of 15% of our outstanding voting stock, unless the merger or combination is approved in a prescribed manner.

Any provision of our amended and restated certificate of incorporation, our amended and restated bylaws or Delaware law that has the effect of delaying or deterring a change in control could limit the opportunity for our stockholders to receive a premium for their shares of our common stock, and could also affect the price that some investors are willing to pay for our common stock.

Changes in our tax provision or exposure to additional tax liabilities could adversely affect our earnings and financial condition.

As a multinational corporation, we are subject to income taxes in the U.S. and various foreign jurisdictions. Significant judgment is required in determining our global provision for income taxes and other tax liabilities. In the ordinary course of a global business, there are intercompany transactions and calculations where the ultimate tax determination is uncertain. Our income tax returns are subject to audits by tax authorities. Although we regularly assess the likelihood of adverse outcomes resulting from these examinations to determine our tax estimates, a final determination of tax audits or tax disputes could have an adverse effect on our results of operations and financial condition.

We are also subject to non-income taxes, such as payroll, sales, use, value-added, net worth, property, gross receipts, and goods and services taxes in the U.S., state and local, and various foreign jurisdictions. We are subject to audit and assessments by tax authorities with respect to these non-income taxes and may have exposure to additional non-income tax liabilities, which could have an adverse effect on our results of operations and financial condition.

On December 22, 2017, the U.S. enacted the Tax Act that instituted fundamental changes to the taxation of multinational corporations. The Tax Act includes changes to the taxation of foreign earnings by implementing a dividend exemption system, expansion of the current anti-deferral rules, a minimum tax on low-taxed foreign earnings and new measures to deter base erosion. The Tax Act also includes a permanent reduction in the corporate tax rate to 21%, repeal of the corporate alternative minimum tax, expensing of capital investment, and limitation of the deduction for interest expense. Furthermore, as part of the transition to the new tax system, a one-time transition tax is imposed on a U.S. shareholder's historical undistributed earnings of foreign affiliates. Although the Tax Act is generally effective January 1, 2018, GAAP requires recognition of the tax effects of new legislation during the reporting period that includes the enactment date, which was December 22, 2017.

As a result of the impact of the Tax Act, the SEC provided guidance that allows us to record provisional amounts for those affected items, with the requirement that the accounting be completed in a period not to exceed one year from the date of enactment. As of December 31, 2018, we completed our analysis of the accounting for the tax effects of the Tax Act and no material adjustments were recognized at year end. The primary impact of the Tax Act relates to the re-measurement of deferred tax assets and liabilities resulting from the Corporate Tax Rate Change, which was recorded as of December 31, 2017. Developing interpretations of the provisions of the Tax Act, changes to U.S. Treasury regulations, administrative interpretations or court decisions interpreting the Tax Act in the future periods may require further adjustments to our analysis.

Our amended and restated certificate of incorporation designates the state or federal courts located in the State of Delaware as the sole and exclusive forum for certain types of actions and proceedings that may be initiated by our stockholders, which could limit our stockholders' ability to obtain a favorable judicial forum for disputes with us or our directors, officers or employees.

Our amended and restated certificate of incorporation provides that, subject to limited exceptions, the state and federal courts located in the State of Delaware will be the sole and exclusive forum for (1) any derivative action or proceeding brought on our behalf, (2) any action asserting a claim of breach of a fiduciary duty owed by any of our directors, officers or other employees to us or our stockholders, (3) any action asserting a claim against us arising pursuant to any provision of the Delaware General Corporation Law, our amended and restated certificate of incorporation or our amended and restated by-laws, or (4) any other action asserting a claim against us that is governed by the internal affairs doctrine. Any person or entity purchasing or otherwise acquiring any interest in shares of our capital stock shall be deemed to have notice of and to have consented to the provisions of our amended and restated certificate of incorporation described above. This choice of forum provision may limit a stockholder's ability to bring a claim in a judicial forum that it finds favorable for disputes with us or our directors, officers or other employees, which may discourage such lawsuits against us and our directors, officers and employees. Alternatively, if a court were to find these provisions of our amended and restated certificate of incorporation inapplicable to, or unenforceable in respect of, one or more of the specified types of actions or proceedings, we may incur additional costs associated with resolving such matters in other jurisdictions, which could adversely affect our business and financial condition.

Table of Contents

Because we do not anticipate paying any cash dividends on our capital stock in the foreseeable future, capital appreciation, if any, will be your sole source of gain and you may never receive a return on your investment.

You should not rely on an investment in our common stock to provide dividend income. We do not anticipate that we will pay any cash dividends to holders of our common stock in the foreseeable future and investors seeking cash dividends should not purchase our common stock. We plan to retain any earnings to invest in our product candidates and maintain and expand our operations. Therefore, capital appreciation, or an increase in your stock price, which may never occur, may be the only way to realize any return on your investment.

ITEM 2. UNREGISTERED SALES OF EQUITY SECURITIES AND USE OF PROCEEDS.

Use of Proceeds from Initial Public Offering of Common Stock

On November 13, 2014, our Registration Statement on Form S-1, as amended (Reg. Nos. 333-199069 and 333-200189) was declared effective in connection with the initial public offering of our common stock. There has been no material change in the planned use of proceeds from our initial public offering as described in our final prospectus filed with the SEC pursuant to Rule 424(b) under the Securities Act on November 14, 2014.

ITEM 3. DEFAULTS UPON SENIOR SECURITIES.

Not applicable.

ITEM 4. MINE SAFETY DISCLOSURES.

Not applicable.

ITEM 5. OTHER INFORMATION.

SIGNATURES

Pursuant to the requirements of the Securities Exchange Act of 1934, as amended, the registrant has duly caused this report to be signed on its behalf by the undersigned thereunto duly authorized.

Dated: August 8, 2019

Dated: August 8, 2019

FibroGen, Inc.

By: /s/ Thomas B. Neff

Thomas B. Neff
Chairman of the Board and Chief Executive Officer

(Principal Executive Officer)

By: /s/ Pat Cotroneo

Pat Cotroneo

Senior Vice President, Finance and Chief Financial Officer (Principal Financial and Accounting Officer)

Exhibit 31.1

CERTIFICATION

- I, Thomas B. Neff, certify that;
- 1. I have reviewed this Form 10-Q of FibroGen, Inc.;
- 2. Based on my knowledge, this report does not contain any untrue statement of a material fact or omit to state a material fact necessary to make the statements made, in light of the circumstances under which such statements were made, not misleading with respect to the period covered by this report;
- 3. Based on my knowledge, the financial statements, and other financial information included in this report, fairly present in all material respects the financial condition, results of operations and cash flows of the registrant as of, and for, the periods presented in this report;
- 4. The registrant's other certifying officer and I are responsible for establishing and maintaining disclosure controls and procedures (as defined in Exchange Act Rules 13a-15(e) and 15d-15(e)) and internal control over financial reporting (as defined in Exchange Act Rules 13a-15(f) and 15d-15(f)) for the registrant and have:
- (a) Designed such disclosure controls and procedures, or caused such disclosure controls and procedures to be designed under our supervision, to ensure that material information relating to the registrant, including its consolidated subsidiaries, is made known to us by others within those entities, particularly during the period in which this report is being prepared;
- (b) Designed such internal control over financial reporting, or caused such internal control over financial reporting to be designed under our supervision, to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles;
- (c) Evaluated the effectiveness of the registrant's disclosure controls and procedures and presented in this report our conclusions about the effectiveness of the disclosure controls and procedures, as of the end of the period covered by this report based on such evaluation; and
- (d) Disclosed in this report any change in the registrant's internal control over financial reporting that occurred during the registrant's most recent fiscal quarter (the registrant's fourth fiscal quarter in the case of an annual report) that has materially affected, or is reasonably likely to materially affect, the registrant's internal control over financial reporting; and
- 5. The registrant's other certifying officer(s) and I have disclosed, based on our most recent evaluation of internal control over financial reporting, to the registrant's auditors and the audit committee of the registrant's board of directors (or persons performing the equivalent functions):
- (a) All significant deficiencies and material weaknesses in the design or operation of internal control over financial reporting which are reasonably likely to adversely affect the registrant's ability to record, process, summarize and report financial information; and
- (b) Any fraud, whether or not material, that involves management or other employees who have a significant role in the registrant's internal control over financial reporting.

Date: August 8, 2019

FibroGen Announces Positive Phase 3 Pooled Roxadustat Safety and Efficacy Results for Treatment of Anemia in Chronic Kidney Disease

Roxadustat cardiovascular safety comparable to placebo in non-dialysis dependent (NDD) patients, as assessed by Major Adverse Cardiovascular Events (MACE) and MACE+

Roxadustat did not increase risk of MACE and reduced risk of MACE+ compared to epoetin alfa in dialysis-dependent (DD) patients;

Roxadustat reduced risk of MACE by 30% and MACE+ by 34% compared to epoetin alfa in the incident dialysis (ID) patient subgroup of the DD population

Roxadustat achieved primary efficacy endpoints in NDD and DD patients

WASHINGTON, Nov. 08, 2019 (GLOBE NEWSWIRE) -- FibroGen, Inc. (NASDAQ:FGEN), today announced results from the pooled analyses of data from six global pivotal Phase 3 trials investigating roxadustat, a first-in-class, orally-administered inhibitor of hypoxia-inducible-factor (HIF) prolyl hydroxylase activity. The pooled analyses assessed the safety and efficacy of roxadustat as a treatment for anemia in chronic kidney disease (CKD) compared to placebo in Non-Dialysis-Dependent (NDD) patients and to standard of care epoetin alfa in Dialysis-Dependent (DD) patients, including the clinically important Incident Dialysis (ID) patient subgroup. These Phase 3 trials conducted by FibroGen and collaboration partners AstraZeneca and Astellas Pharma, Inc., enrolled over 8,000 CKD patients from more than 50 countries.

"The pooled safety analyses assessing roxadustat as a treatment for anemia in chronic kidney disease demonstrate a cardiovascular safety profile comparable with placebo in patients not on dialysis, and comparable or in some cases better than that of epoetin alfa in patients on dialysis," said Robert Provenzano, MD, Associate Professor of Medicine, Wayne State University, Detroit, Michigan, U.S. and a primary investigator on the global Phase 3 program. "It is exciting to see this application of the groundbreaking science on oxygen sensing and adaptation to hypoxia recently awarded the 2019 Nobel Prize in Physiology or Medicine, and championed by FibroGen's late founder and CEO, Tom Neff, who sadly passed away earlier this year. These positive safety results, coupled with roxadustat's well-defined efficacy in CKD patients, and its oral formulation, support the potential for roxadustat to become an important new treatment option for patients with anemia associated with CKD."

These late-breaking data were featured in the High-Impact Clinical Trials oral abstract session on Friday, November 8, at the American Society of Nephrology Kidney Week 2019 in Washington, D.C. (Presentation FR-OR131)

Pooled Efficacy Results

Individually, all six Phase 3 trials included in these pooled analyses (OLYMPUS, ANDES, ALPS, HIMALAYAS, SIERRAS, and ROCKIES) achieved the primary efficacy endpoint of mean hemoglobin (Hb) change from baseline compared to placebo in patients not on dialysis and to epoetin alfa in patients on dialysis.

In the pooled analysis of Non-Dialysis Dependent (NDD) patients (n=4277):

- Roxadustat was statistically superior to placebo, demonstrating an improvement of 1.85 g/dL in patients' Hb levels from baseline to the average over 28-52 weeks compared to 0.13 g/dL among patients in the placebo arm, for an overall treatment difference of 1.72 g/dL (p<0.001).
- The rate of rescue therapy required in the first year of treatment among patients treated with roxadustat (8.9%) was less than one third of the rate of the placebo arm (31.1%) p<0.0001; HR=0.19 (95% CI: 0.16, 0.23).
- The rate of red blood cell (RBC) transfusions required in the first year of treatment was also lower with roxadustat (5.2%) than placebo (15.4%) p<0.0001; HR=0.26 (95% CI: 0.21, 0.32).

- Roxadustat was statistically superior to epoetin alfa, demonstrating an improvement of 1.22 g/dL in patients' Hb levels from baseline to the average over 28-52 weeks compared to 0.99 g/dL, for an overall treatment difference of 0.23 g/dL (p<0.0001).
- Roxadustat was superior to epoetin alfa across patients regardless of inflammation status, categorized by the baseline CRP levels (CRP > 4.9 mg/L), demonstrating an improvement of 1.29 g/dL and 1.27 g/dL in Hb levels from baseline in patients with and without inflammation, respectively, compared to 0.96 g/dL and 1.05 g/dL with epoetin alfa.
- The rate of RBC transfusions required in the first year of treatment was also lower with roxadustat (9.5%) than with epoetin alfa (12.8%) in DD patients (p=0.046). HR=0.82 (95% CI: 0.679, 0.997).

Across the NDD and DD patient populations, roxadustat was effective in raising Hb levels regardless of whether patients were iron-replete (i.e., shown to have sufficient stores of iron in their body, TSAT% ≥20% and Ferritin ≥100 ng/mL) at baseline. NDD patients experienced a mean change of 1.94 g/dL from baseline with roxadustat in both iron-replete and non-replete subpopulations, compared to 0.13 g/dL in iron-replete and 0.33 g/dL in non-replete patients receiving placebo.

Pooled Safety Results

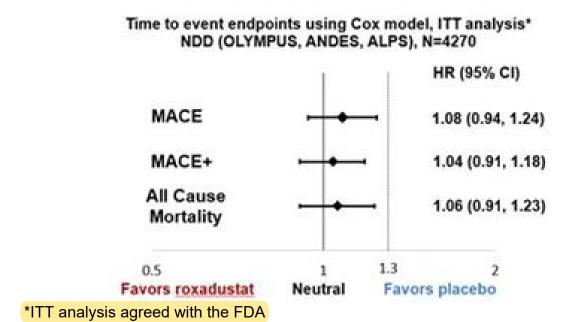

Across these pooled safety analyses, the studies evaluated several different patient populations, including:

- Non-Dialysis Dependent (NDD) patients;
- Dialysis Dependent (DD) patients; and
 - Incident Dialysis (ID) patients, who are patients who recently initiated dialysis (within 4 months). This ID subpopulation is the appropriate setting for comparison of roxadustat versus epoetin alfa, as this period of initial dialysis treatment is associated with substantially increased levels of safety events and patient mortality; whereas the stable DD patients have survived this period and thus are responsive to stable doses of erythropoiesis stimulating agents (ESA) such as epoetin alfa.

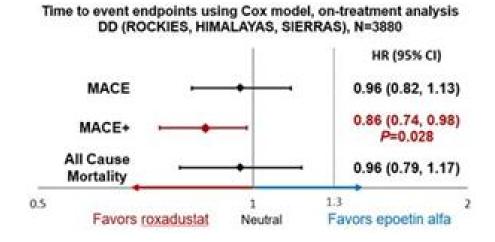

Cardiovascular (CV) endpoints were defined as:

- Time to first Major Adverse Cardiovascular Event (MACE): a composite endpoint of all-cause mortality, myocardial infarction, stroke;
- Time to first MACE+, a composite endpoint which includes MACE plus unstable angina and heart failure requiring hospitalization; and
- Time to all-cause mortality
 - In the Non-Dialysis Dependent (NDD) patient population:
 - Risks of MACE, MACE+, and all-cause mortality in roxadustat patients were comparable to placebo in the ITT analyses based on a reference non-inferiority margin

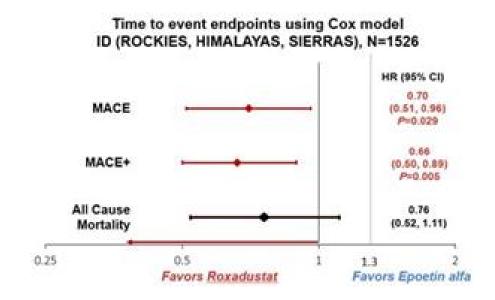

of 1.3.

- o In a post hoc subgroup analysis of 2,438 non-dialysis patients with baseline eGFR≥15,
 - The one-year decline in eGFR in roxadustat treated patients (-2.8) was significantly less than that in placebo treated patients (-4.4), with a treatment difference of 1.6 mL/min/1.73m2 (p<0.0001).
- In the Dialysis Dependent (DD) patient population:
 - Risks of MACE and all-cause mortality in roxadustat patients were not increased compared to those for patients receiving epoetin alfa based on a reference non-inferiority margin of 1.3.
 - Risk of MACE+ was 14% lower in roxadustat-treated patients than in those receiving epoetin alfa.

- The Incident Dialysis (ID) patient sub-group of the Dialysis Dependent (DD) patient population:
 - Risk of MACE was 30% lower in roxadustat patients than in epoetin alfa patients, and risk of MACE+ was 34% lower.
 - Roxadustat-treated patients' risk showed a trend towards lower all-cause mortality relative to epoetin alfa-treated patients.

"The positive efficacy and cardiovascular safety results from these pooled analyses, in a population with a broad range in both CKD and anemia severity in over 8,000 patients across six Phase 3 global trials, reaffirm the potential of roxadustat to improve treatment for anemia in CKD patients." said K. Peony Yu, MD, Chief Medical Officer, FibroGen. "There has not been much progress in treatment approaches for anemia in over 30 years, and more effective, safe, and convenient treatment options for patients are long overdue. We are privileged to be advancing this effort with roxadustat and plan to file the NDA in the U.S. by the end of this quarter for both dialysis and non-dialysis patients with our partner AstraZeneca and the MAA in Europe by the end of first quarter 2020 with our partner Astellas, followed by submissions to other regulatory authorities."

About Anemia Associated with CKD

Anemia can be a serious medical condition in which patients have insufficient red blood cells and low levels of hemoglobin, a protein in red blood cells that carries oxygen to cells throughout the body. Anemia in CKD is associated with increased risk of hospitalization, cardiovascular complications and death, also frequently causing significant fatigue, cognitive dysfunction and reduced quality of life. Severe anemia is common in patients with CKD, cancer, myelodysplastic syndromes (MDS), inflammatory diseases, and other serious illnesses.

Anemia is particularly prevalent in patients with CKD. The prevalence of CKD in the adult population is estimated at 10-12% globally and is generally a progressive disease characterized by gradual loss of kidney function that may eventually lead to kidney failure, or end stage renal disease, requiring

dialysis or kidney transplant to survive. Blood transfusion is used for treating life-threatening severe anemia. However, blood transfusions reduce the patient's opportunity for kidney transplant, increase risk of infections and the risk of complications such as heart failure and allergic reactions.

According to the United States Renal Data System (USRDS), over 14% of the U.S. adult population is affected by CKD, and a majority of dialysis-eligible CKD patients are currently on dialysis. It is estimated that approximately 509,000 patients are receiving dialysis in the U.S. as of 2016.

About Roxadustat

Roxadustat (FG-4592) is a first-in-class, orally administered small molecule HIF-PH inhibitor that promotes erythropoiesis through increasing endogenous production of erythropoietin, improving iron regulation, and overcoming the negative impact of inflammation on hemoglobin syntheses and red blood cell production by downregulating hepcidin. Administration of roxadustat has been shown to induce coordinated erythropoiesis, increasing red blood cell count while maintaining plasma erythropoietin levels within or near normal physiologic range in multiple subpopulations of chronic kidney disease (CKD) patients, including in the presence of inflammation and without a need for supplemental intravenous iron. Roxadustat is currently approved in China for the treatment of anemia in CKD patients on dialysis and patients not on dialysis and approved in Japan for the treatment of anemia in CKD patients on dialysis. Roxadustat is in Phase 3 clinical development in the U.S. and Europe and in Phase 2/3 development in China for anemia associated with myelodysplastic syndromes (MDS), and in a Phase 2 U.S. trial for treatment of chemotherapyinduced anemia.

Astellas and FibroGen are collaborating on the development and commercialization of roxadustat for the treatment of anemia in territories including Japan, Europe, the Commonwealth of Independent States, the Middle East, and South Africa. AstraZeneca and FibroGen are collaborating on the development and commercialization of roxadustat for the treatment of anemia in the U.S., China, and other markets in the Americas and in Australia/New Zealand as well as Southeast Asia.

About FibroGen

FibroGen, Inc., headquartered in San Francisco, California, with subsidiary offices in Beijing and Shanghai, People's Republic of China, is a leading biopharmaceutical company discovering and developing a pipeline of first-in-class therapeutics. The company applies its pioneering expertise in hypoxia-inducible factor (HIF) and connective tissue growth factor (CTGF) biology, and clinical development to advance innovative medicines for the treatment of anemia, fibrotic disease, and cancer. Roxadustat, the company's most advanced product candidate, is an oral small molecule inhibitor of HIF prolyl hydroxylase (HIF-PH) activity, completing worldwide Phase 3 clinical development for the treatment of anemia in chronic kidney disease (CKD), is approved by the National Medical Products Administration (NMPA) in China for CKD patients on dialysis and not on dialysis and by the Ministry of Health, Labour and Welfare in Japan for CKD patients on dialysis. Roxadustat is in Phase 3 clinical development in the U.S. and Europe and in Phase 2/3 development in China for anemia associated with myelodysplastic syndromes (MDS), and in a Phase 2 U.S. trial for treatment of chemotherapy-induced anemia. Pamrevlumab, an anti-CTGF human monoclonal antibody, is in Phase 3 clinical development for the treatment of idiopathic pulmonary fibrosis (IPF)

and pancreatic cancer, and is currently in a Phase 2 trial for Duchenne muscular dystrophy (DMD). FibroGen is also developing a biosynthetic cornea in China. For more information, please visit www.fibrogen.com.

Forward-Looking Statements

This release contains forward-looking statements regarding our strategy, future plans and prospects, including statements regarding the development of roxadustat, our interpretation of the pooled safety analyses and other analyses of the global Phase 3 program for roxadustat, , the potential for and timing of an NDA submission to the FDA and an MAA submission to the EMA for potential marketing approval for roxadustat, the potential safety and efficacy profile of our product candidates, aspects of roxadustat that could affect its commercial prospects, and our clinical, regulatory plans, and those of our partners. These forward-looking statements include, but are not limited to, statements about our plans, objectives, representations and contentions and are not historical facts and typically are identified by use of terms such as "may," "will", "should," "on track," "could," "expect," "plan," "anticipate," "believe," "estimate," "predict," "potential," "continue" and similar words, although some forward-looking statements are expressed differently. Our actual results may differ materially from those indicated in these forward-looking statements due to risks and uncertainties related to the continued progress and timing of our various programs, including the enrollment and results from ongoing and potential future clinical trials, and other matters that are described in our Annual Report on Form 10-K for the fiscal year ended December 31, 2018, and our Quarterly Report on Form 10-Q for the fiscal quarter ended June 30, 2019 filed with the Securities and Exchange Commission (SEC), including the risk factors set forth therein. Investors are cautioned not to place undue reliance on these forward-looking statements, which speak only as of the date of this release, and we undertake no obligation to update any forward-looking statement in this press release, except as required by law.

Roxadustat Phase III programme pooled analyses showed positive efficacy and no increased cardiovascular risk in patients with anaemia from chronic kidney disease

PUBLISHED 8 November 2019

In non dialysis-dependent patients receiving roxadustat, the risk of MACE, MACE+ and all-cause mortality was comparable to placebo

Dialysis-dependent patients receiving roxadustat had a lower risk of MACE+ and no increased risk of MACE or all-cause mortality versus epoetin alfa

In incident dialysis patients, roxadustat had a lower risk of MACE and MACE+ and showed a trend towards lower risk of all-cause mortality relative to epoetin alfa

AstraZeneca and FibroGen Inc. (FibroGen) today presented pooled efficacy and cardiovascular (CV) safety analyses from the pivotal Phase III programme assessing roxadustat for the treatment of patients with anaemia from chronic kidney disease (CKD).

The pooled CV safety analyses showed that roxadustat, an oral first-in-class hypoxia-inducible factor prolyl hydroxylase inhibitor (HIF-PHI), did not increase the risk of MACE, MACE+ and allcause mortality in non dialysis-dependent (NDD) patients compared to placebo and dialysisdependent (DD) patients compared to epoetin alfa, a current medicine used to treat anaemia.

In a clinically important predefined subgroup of incident dialysis (ID) patients, defined as patients who have been on dialysis for four months or less, roxadustat reduced the risk of MACE and MACE+ and showed a trend towards lower risk of all-cause mortality relative to epoetin alfa.

Key safety endpoints consisted of time to major adverse CV events (MACE), defined as all-cause mortality, stroke and myocardial infarction, and time to MACE+, defined as MACE, unstable angina requiring hospitalisation and congestive heart failure requiring hospitalisation.

The results were presented in an oral late-breaking abstract session at the American Society of Nephrology (ASN) Kidney Week 2019 in Washington, D.C., US.

Mene Pangalos, Executive Vice President, BioPharmaceuticals, R&D, said: "These highly anticipated results reinforce our confidence in the potential of roxadustat to address significant unmet medical needs among patients with anaemia from chronic kidney disease, particularly for those who have recently started dialysis. The pooled analyses showed incident dialysis patients receiving roxadustat had a lower risk of cardiovascular events which is important as these patients may experience higher rates of morbidity and mortality than those on stable dialysis."

Robert Provenzano, MD, Associate Professor of Medicine, Wayne State University, Detroit, Michigan, US and a primary investigator on the global Phase III programme, said: "Roxadustat is the first in a new class of medicines for the treatment of anaemia from chronic kidney disease. This pooled cardiovascular safety data, together with strong efficacy data, support its potential as an important new treatment option for patients with anaemia from chronic kidney disease who have seen little to no innovation in decades."

Key headline data from the roxadustat Phase III programme pooled safety analyses

Population Comparator	MACE	IVI A C. F. +	All-cause mortality	Conclusion
NDD (n=4,270)	(95% CI,	(95% CI,	(95% CI, 0.91, 1.23)	The risk of MACE, MACE+ and all-cause mortality in roxadustat patients was
Placebo				comparable to placebo

Population Comparator	MACE	MACE+	All-cause mortality	Conclusion
ID ^{i,ii} (n=1,526) Epoetin alfa	HR 0.70 (95% CI, 0.51, 0.96)	HR 0.66 (95% CI, 0.50, 0.89)	HR 0.76 (95% CI, 0.52, 1.11)	In ID patients, those taking roxadustat had a 30% lower risk of MACE and 34% lower risk of MACE+ compared to those taking epoetin alfa, with a trend towards lower all-cause mortality for roxadustat relative to epoetin alfa
DD (n=3,880) Epoetin alfa	HR 0.96 (95% CI, 0.82, 1.13)	HR 0.86 (95% CI, 0.74, 0.98)	HR 0.96 (95% CI, 0.79, 1.17)	No increased risk of MACE and all-cause mortality and a lower risk of MACE+ compared to epoetin alfa

- i. ID patients are those who initiated dialysis within four months prior to randomisation
- ii. ID patients are a subgroup of the DD patient population

The primary efficacy endpoint was achieved in the pooled analyses for NDD and DD patients, and in all individual Phase III trials. Data from the pooled efficacy and CV safety analyses, together with other statistical analyses, will form part of the regulatory submission in the US, which is anticipated in Q4 2019.

The pooled efficacy analyses in the NDD population showed roxadustat was superior to placebo, regardless of iron-repletion, with a mean increase from baseline in haemoglobin (Hb) levels averaged over weeks 28 to 52 of 1.85 g/dL in patients treated with roxadustat compared to 0.13 g/dL with placebo (p<0.001).

The pooled efficacy analyses in the DD population showed roxadustat demonstrated a statistically significant mean increase from baseline in Hb levels averaged over weeks 28 to 52 with 1.22 g/dL in patients treated with roxadustat compared to 0.99 g/dL with epoetin alfa (p<0.001).

Roxadustat is currently approved in China for the treatment of anaemia in patients with CKD, regardless of whether they require dialysis, and in Japan for the treatment of dialysis patients with anaemia from CKD.

About roxadustat

Roxadustat is a HIF-PHI that promotes erythropoiesis by increasing endogenous production of erythropoietin and improving iron regulation and overcoming the negative impact of inflammation on haemoglobin synthesis and red blood cell production by downregulating hepcidin. Use of roxadustat has been shown to induce coordinated erythropoiesis, increasing red blood cell count while maintaining plasma erythropoietin levels within or near normal physiologic range, in multiple subpopulations of CKD patients, including in the presence of inflammation and without a need for supplemental IV iron.

About the Phase III programme

FibroGen, Inc., (FibroGen) and AstraZeneca are collaborating on the development and commercialisation of roxadustat for the treatment of anaemia in patients with CKD in the US, China, and other global markets. FibroGen and Astellas Pharma Inc. (Astellas) are collaborating on the development and commercialisation of roxadustat for the treatment of anaemia in patients with chronic kidney disease (CKD) in territories including Japan, Europe, the Commonwealth of Independent States, the Middle East, and South Africa.

The global Phase III programme includes more than 9,000 patients and was conducted by AstraZeneca, FibroGen and Astellas together. The OLYMPUS, ALPS and ANDES trials evaluated roxadustat vs. placebo in NDD patients. ROCKIES, SIERRAS and HIMALAYAS evaluated roxadustat vs. epoetin alfa in DD patients. HIMALAYAS evaluated roxadustat vs. epoetin alfa in ID patients; there were ID patients in ROCKIES and SIERRAS. PYRENEES was not included in the pooled CV safety analyses.

About anaemia

Anaemia can be a serious medical condition in which patients have insufficient red blood cells and low levels of haemoglobin, a protein in red blood cells that carries oxygen to cells throughout the body. 1,2 Anaemia from CKD is associated with increased risk of hospitalisation, CV complications and death, also frequently causing significant fatigue, cognitive dysfunction and decreased quality of life. 4 Severe anaemia is common in patients with CKD, cancer, myelodysplastic syndrome, inflammatory diseases and other serious illnesses.

Anaemia is particularly prevalent in patients with CKD. CKD affects more than 200 million patients worldwide and is generally a progressive disease characterised by gradual loss of kidney function that may eventually lead to kidney failure.

According to the United States Renal Data System, about 80% of the approximately 509,000 patients receiving dialysis in the US in 2016 were being treated with erythropoiesis-stimulating agents (ESA).⁵ Patients seldom receive ESA treatment until they initiate dialysis therapy.

About AstraZeneca in CVRM

Cardiovascular, Renal & Metabolism (CVRM) together forms one of AstraZeneca's three therapy areas and is a key growth driver for the Company. By following the science to understand more clearly the underlying links between the heart, kidneys and pancreas, AstraZeneca is investing in a portfolio of medicines to protect organs and improve outcomes by slowing disease progression, reducing risks and tackling co-morbidities. The Company's ambition is to modify or halt the natural course of CVRM diseases and potentially regenerate organs and restore function, by continuing to deliver transformative science that improves treatment practices and cardiovascular health for millions of patients worldwide.

About AstraZeneca

AstraZeneca is a global, science-led biopharmaceutical company that focuses on the discovery, development and commercialisation of prescription medicines, primarily for the treatment of diseases in three therapy areas - Oncology, CVRM, and Respiratory. AstraZeneca operates in over 100 countries, and its innovative medicines are used by millions of patients worldwide. For more information, please visit astrazeneca.com and follow the Company on Twitter @AstraZeneca.

Operator

Welcome to the FibroGen Third Quarter 2019 Financial Results Conference Call. My name is Erin, and I'll be your operator for today's call.

[Operator Instructions] Please note that this conference is being recorded. I will now turn the call over to Michael Tung. Michael, you may begin.

Michael Tung

Investor Relations Executive

Thank you, Erin, and good afternoon, everyone. Thank you for joining our call. Today, we'll be reporting financial results and corporate updates for the third quarter of 2019. Joining me today on the call are Jim Schoeneck, Interim Chief Executive Officer; Dr. Peony Yu, Chief Medical Officer; Ms. Chris Chung, Senior Vice President, China; Dr. Elias Kouchakji, Senior Vice President, Clinical Development and Drug Safety and Pharmacovigilance; and Mr. Pat Cotroneo, Chief Financial Officer.

Following our prepared remarks, Jim will discuss upcoming milestones, and we will then open the call to Q&A. During this call, we may make forward-looking statements regarding our business, including our collaborations with AstraZeneca and Astellas; financial guidance; the initiation, enrollment, design, conduct and result of clinical trials; our regulatory strategies and potential regulatory results; our research and development activities and certain other business matters.

For risks and uncertainties regarding our business and statements made on the call today as well as factors beyond our control that may cause differences between current expectations and actual results. We refer you to our annual report on Form 10-K for the fiscal year ended December 31, 2018, and to our quarterly report on Form 10-Q for the quarter ended September 30, 2019, filed with the Securities and Exchange Commission.

Copies of these filings may be found in the Investors section of our website. We undertake no obligation to update any forward-looking statement, whether as a result of new information, future development or otherwise. The format for today's call includes remarks from FibroGen's management team, and then we'll open the lines to take your questions. The press release reporting our financial results and business update and a webcast of today's conference call can be found on the Investors section of the FibroGen website at www.fibrogen.com.

The webcast will be available for 30 days from today's date. And with that, I'd now like to turn the call over to our Interim CEO, Jim Schoeneck.

James A. Schoeneck

Chairman of the Board

Thank you, Mike, and thank you all for joining us today. During today's call, I will give you an overview of our third quarter results and recent accomplishments. Dr. Peony Yu will then give a review of the roxadustat data from the American Society of Nephrology Meeting, which just wrapped up yesterday. Following that, Chris Chung will update you on our China efforts. Dr. Elias Kouchakji will give a pamrevlumab update, and Pat Cotroneo will discuss our financials. Then I'll provide some closing comments and open the call to questions.

First, I want to take a moment to acknowledge with a great sense of loss the recent and unexpected passing of FibroGen's Founder and long-term Chairman and CEO, Tom Neff. Tom was a man of vision, determination and leadership and was deeply committed to innovation. We at FibroGen are deeply indebted to him. Tom founded FibroGen in 1993, with the vision of treating fibrosis at a time when there was no hope for the disease category. He led the company for over 25 years and established a culture and a team driven to support his vision, motivated by his commitment to improve the lives of those suffering from conditions with no satisfactory therapeutic options.

In founding FibroGen, Tom assembled global scientific leaders in areas critical to the understanding of fibrosis and the fibrotic disease mechanism, ultimately providing the basis for pamrevlumab and through the exploration of prolyl hydroxylase enzyme activity, the basis for roxadustat. Tom was intimately involved in the discovery and development of roxadustat and pamrevlumab and positioned the company for great success, given the breadth of the application for both compounds. His contribution as a pioneer in the biotechnology industry will be measured by the lives that he has and will continue to touch as FibroGen continues to develop medicines for unmet medical needs. The FibroGen Board and Management team are committed to fulfill and build upon Tom's vision.

As you all saw last month, the 2019 Nobel Prize in physiology [or] medicine was awarded to 3 physician scientists for their research into how cells send oxygen and how they function in low oxygen conditions or hypoxia. The collective contributions of Dr. Bill Kaelin of the Dana-Farber Cancer Institute; Sir Peter Ratcliffe of the University of Oxford; and Dr. Gregg Semenza of Johns Hopkins University School of Medicine identified the pathway by which cells detect oxygen and respond to hypoxia. This seminal science has paved the way for promising new strategies to fight anemia, cancer and many other diseases.

FibroGen is fortunate to work closely with Bill Kaelin, a collaborator and member of the company's scientific advisory board for nearly 2 decades. Today, roxadustat is the first medication in the world which applies this groundbreaking science. As Dr. Bob Provenzano stated at the American Society Nephrology last week, this is a great example of cutting-edge science moving from bench to bedside. Roxadustat has already approved in China for the treatment of anemia associated with chronic kidney disease, and in Japan for CKD patients on dialysis. We're also currently preparing regulatory submissions for the U.S. and Europe.

Last week, during the American Society of Nephrology Kidney Week 2019, FibroGen and our partners Astellas and AstraZeneca presented roxadustat data from our Phase III program as well as pooled cardiovascular safety and efficacy results. The pooled data kicked off ASN's high-impact clinical trial session with a packed room of almost 2,000 people. One nephrologist called it the largest crowd for an anemia presentation in well over a decade. This set of global studies covered the spectrum of chronic kidney disease, anemia, and it's believed to be the largest and most comprehensive study population ever reported with over 8,000 patients. Details of the data presented can be found on our website and in our press release from last Friday. Our studies assess cardiovascular safety and dialysis and nondialysis-dependent patients using the endpoints of major adverse cardiovascular events, known as MACE and MACE+, which adds hospitalization due to unstable angina and congestive heart failure. The pooled results show that roxadustat's cardiovascular safety was comparable to placebo in nondialysis-dependent patients. And in dialysis-dependent patients, roxadustat did not increase the risk of MACE and reduce the risk of MACE+ compared to epoetin alfa, the leading product currently used to treat this population.

Finally, in the subgroup of dialysis patients who recently started dialysis, referred to as incident dialysis patients, roxadustat reduced MACE by 30% and MACE+ by 34% compared to epoetin alfa. Roxadustat achieved the primary hemoglobin efficacy endpoints in all of these groups.

Of note, roxadustat was shown to raise hemoglobin levels regardless of iron status at baseline in patients who required no supplementary IV iron and in patients with inflammation, a group that is difficult to treat with current therapies. Having an oral product with this safety and efficacy profile can offer patients with anemia or chronic kidney disease and their doctors a treatment unlike anything currently on the market in the U.S. or Europe.

Let me briefly mention a few other highlights from the quarter. We initiated our Phase III pamrevlumab program, enrolling the first patients in our idiopathic pulmonary fibrosis or IPF trial as well as our study in locally advanced pancreatic cancer. Our Phase II IPF trial was published in the Lancet Respiratory Medicine journal and in accompanying editorial, Professor Athol Wells of the Royal Brompton Hospital stated, "In conclusion, it's difficult to imagine more encouraging Phase II results of a novel drug for IPF."

In China, we booked our first roxadustat product revenue anywhere in the world and we continue to prepare for the full market launch with our 50-50 partner, AstraZeneca. In September, FibroGen and roxadustat won the 2019 Dushu Lake Prize for innovative drug with the highest clinical value in China. I think you'll agree with me, it's been a very, very accomplished guarter.

Now I'll turn it over to Peony, who will give you a more in-depth discussion of roxadustat and the data from the ASN Meeting.

K. Peony Yu

Chief Medical Officer

Thank you, Jim. Last week, FibroGen and our partners presented roxadustat Phase III results at the Annual American Society of Nephrology Meeting, which included over 13,000 kidney professionals. As the nephrologists share our excitement of a potential game changer in anemia therapy based on strong scientific foundation. Today, I would like to review the highlights.

The pooled analyses included data from 6 Phase III trials, including over 8,000 patients and encompass over 13,000 patient exposure years. Our studies evaluated 3 patient populations; nondialysis-dependent, dialysis-dependent and incident dialysis, which is a subgroup of patients recently started dialysis within 4 months of [studies] participation. We reported on results of the following safety endpoints; major adverse cardiovascular events or MACE endpoints consists of death due to all causes, nonfatal myocardial infarction and nonfatal stroke; MACE+ consists of the 3 MACE events plus hospitalization due to heart failure or unstable angina, all-cause mortality is simply all death due to any cause.

To maintain objectivity and consistency, the events in these cardiovascular endpoints were adjudicated by independent adjudicators blinded to treatment assignment. The time-to-event analyses are conducted based on pooling strategy and analytical approaches agreed with the FDA and the time to MACE is the primary safety endpoint in the U.S., supported by results of MACE+, which is recognized as an important endpoint in the nephrology community.

In nondialysis, where roxadustat was compared to placebo, which is the gold standard in safety assessment, roxadustat was comparable to placebo in MACE and MACE+ risk using a commonly applied noninferiority margin of 1.3. In dialysis patients, roxadustat reduced the risk of MACE+ by 14% compared to epoetin alfa and had no increased risk of MACE compared to EPO using a commonly applied NI margin of 1.3.

In incident dialysis, roxadustat had a 30% lower risk of MACE and a 34% lower risk of MACE+ than EPO.

Let's discuss the rest of the efficacy and safety results, starting with nondialysis. 4,270-plus CKD patients were enrolled into the 3 Phase III nondialysis studies comparing roxadusat to placebo. In these studies, we included CKD stage 3, 4 and 5 patients of whom 42% were CKD stage 5. Their anemia tends to be more severe with their more advanced chronic kidney disease, and they have been generally excluded from prior large CKD anemia studies of ESAs. Similarly, we included patients with a range of iron [scores] with 40% of study patients non-iron [replete] at baseline, and thus, they were ineligible for ESA treatment, based on the current ESA label.

Roxadustat met the primary efficacy endpoint of mean change from baseline to average hemoglobin over weeks 28 to 52, in which -- I'm sorry, in each of the 3 individual Phase III studies and in the pooled analyses in which roxadustat was superior to placebo regardless of CKD severity, regardless of severity of anemia at baseline and regardless of iron [repletion] status. Roxadustat's efficacy is accompanied by an 81% risk reduction in use of rescue treatment, which includes IV iron, ESA and transfusion and a 74% reduction in the risk of red blood cell transfusion, with p-value of 0.001, p-value less than.

Importantly, in comparison to placebo, roxadustat patients also show a slower decline in eGFR, which is a measure of kidney function. Patients with base -- in patients with baseline eGFR of 15 or higher during the first year of treatment.

The 1-year decline in eGFR in roxa patients was 2.8, which is significantly less than the decline in placebo patients of 4.4 with a treatment difference of 1.6 and p-value has been 0 in that.

This represents a 38% reduction in eGFR decline relative to placebo. Turning to cardiovascular safety. In the CKD nondialysis pool based on ITT analysis, roxadustat was comparable to placebo.

For reference, here are the hazard ratios. MACE hazard ratio of 1.08 with 95% confidence interval of 0.94 and 1.24, MACE+ has a ratio of 1.04 with confidence interval of 0.91 and 1.18, all-cause mortality has a ratio of 1.06, with confidence interval of 0.91 and 1.23.

We have received questions on the individual components of cardiovascular composite endpoint in nondialysis with the most interest in stroke.

Well, this is most likely because of the TREAT study on that darbepoetin resulted in the ESA label restriction in its use in nondialysis and dialysis patients. I want to be clear from the outset. We believe the data from the individual components of MACE and MACE+ in the roxadustat program are consistent with the results in the overall analyses. Stated another way, we believe the results in the individual components are comparable to placebo in nondialysis. This is also true for the dialysis pool. Before we dive into details, I want to remind you that the roxadustat nondialysis program was powered for assessing the MACE composite endpoint and not the individual components.

To give a sense of magnitude, in the roxadustat program, stroke represents only 10% of the MACE events in the nondialysis pool and the incidence of rate in roxadustat is comparable to placebo, which is 1.2 per 100 patient years in roxadustat versus 1.1 in placebo arm. Hazard ratio of 1.22, with 95% confidence interval of 0.80 and 1.86.

As a reminder, in the TREAT study the incident rate of stroke in darbepoetin was twice that of placebo, with hazard ratio of 1.92 and 95% confidence interval of 1.38 and 2.18. The rest of the MACE+ component in our nondialysis pool is as follows. All-cause mortality has a ratio of 1.06, confidence interval of 0.91 and 1.23, which we stated earlier. MI has a ratio of 1.28, confidence interval of 0.9 and 1.84 and stable angina requiring hospitalization with hazard ratio of 0.49 and confidence interval of 0.19 and 1.27. Finally, congestive heart failure requiring hospitalization, which is important in CKD patients has hazard ratio of 0.89, confidence interval of 0.72 and 1.12.

Based on the composite endpoints of time to MACE, MACE+, all-cause mortality and the individual components, the overall cardiovascular safety of roxadustat is comparable to placebo. The dialysis-dependent patient pool consists of 180 patients who were randomized one-to-one to receive roxadustat or epoetin alfa in 3 dialysis Phase III studies. The primary efficacy endpoint of mean change in hemoglobin from baseline to week 28 to 52 was met in each individual study and in the pooled analyses. Roxadustat achieved higher hemoglobin level than active comparator of epoetin alfa. This result was seen in patients with or without inflammation as measured by CRP with similar roxadustat dose requirements regardless of inflammation status with roxadustat treated patients receiving less IV iron than EPO patients. While transferrin saturation or TSAT, a measure of iron store in the body were comparable between the 2 treatment arms.

In addition, when compared with EPO, roxadustat-treated patients had a lower red blood cell transfusion risk than EPO-treated patients. Hazard ratio of 0.82, p-value of 0.046.

The combination of findings above reflects the benefits of coordinated erythropoiesis with roxadustat as treatment resulted in more efficient iron utilization, lower transfusion requirement and can potentially overcome ESA hyporesponsiveness.

Turning to cardiovascular endpoint analysis of the dialysis pool. In MACE and in all-cause mortality, roxadustat had no increased risk relative to EPO.

In MACE+, roxadustat had a 14% reduction in risk compared to EPO. I would like to point out the incidence rate of each of the individual MACE+ components in dialysis are numerically lower in roxadustat than EPO.

Finally, let's talk about the exciting patient population, incident dialysis, which is a pre-specified subgroup of the dialysis-dependent pool. Here, we studied 1,526 new dialysis patients who commenced treatment within 4 months before study participation and were treated up to 3 years with an average treatment duration of 1.5 years.

In the incident dialysis pool, in comparison to epoetin alfa, roxadustat treatment resulted in a 30% reduction in the risk of MACE and a 34% reduction in the risk of MACE+ [would trend] for lower risk of death. These results suggest potential long-term safety benefits in selecting roxadustat when initiating anemia therapy in dialysis patients.

To evaluate the merits of roxadustat, it is important to put together an overall picture, taking into account efficacy and safety and ask if this drug has the potential to improve anemia treatment in CKD patients. Our answer is, yes.

In nondialysis, our Phase III program show roxadustat treatment corrected anemia effectively regardless of iron repletion and reduced risk of large scale use of blood transfusion while also slowing down the decline in kidney function in patients with EGFR greater than or equal to 15, while MACE, MACE+ and all-cause mortality risk were comparable to placebo, the gold standard.

Because of the safety-related treatment restriction of ESA, coupled with the iron repletion requirement and the inconvenience of parenteral administration requirements, currently there is little use of ESA in nondialysis patients, as USRDS reported that only 15% of patients entering dialysis had received prior ESA treatment. If approved, roxadusat could deliver the therapeutic benefits with the convenience of a pill, unlike ESA, which requires frequent injections at the doctor's office. In addition to the favorable efficacy and safety characteristics, the convenient dosing of oral medication and removal of the financial and time burden from patients need to [stock] and inject the medicine, we believe roxadustat has the potential to improve treatment access and patient compliance. Therefore, we believe we have an unprecedented opportunity to expand anemia therapy to the millions of nondialysis patients whose anemia go unaddressed.

In dialysis, currently, the decision on the choice of anemia agent is generally made at the early periods of dialysis treatment. With a 30% reduction in MACE risk and a 34% reduction in MACE+ risk compared with epoetin alfa in incident dialysis patients, we believe roxadustat could be viewed as a safer option for patients initiating chronic dialysis, while benefiting from the robust efficacy in patients with or without inflammation with less IV iron use and lower transfusion rate compared to EPO in the dialysis patients.

We are privileged to have an opportunity to potentially introduce a new standard for anemia therapy for CKD patients with roxadustat, a first-in-class agent based on Nobel winning science. We believe these compelling efficacy results with demonstration of clinical benefits accompanied by the above safety results could serve as strong basis for marketing approval in both the U.S., Europe and other countries in the world. Working with our partner, AstraZeneca, we have made a substantial progress in preparing NDA for CKD anemia in patients on dialysis and in patients not on dialysis. We plan to submit the NDA for both indications before year-end. We are working closely with Astellas, our European partner and expect to file the MAA for both indications in the first quarter of 2020.

Encouraged by the safety and efficacy results in CKD, we continue to expand treatment of anemia of other etiologies. In MDS, we have 2 ongoing clinical studies; a Phase III U.S. global study in transfusion-dependent MDS patients and a Phase II/III study in nontransfusion-dependent MDS patients in China. From Phase III global study results of the open-label [lead-in portion] , demonstrating roxadustat efficacy in MDS patients will be presented in an oral session of the upcoming American Society of Hematology Meeting in Orlando next month. We have also started a Phase II U.S. study of roxadustat for treating chemotherapy-induced anemia which we believe [to] have much opportunity to address the unmet need of a large patient population.

Our founding CEO led pioneering HIF-PHI for anemia therapy. We are committed to carry on Tom Neff's legacy to develop innovative medicines to improve patient care.

I now like to turn the call over to Chris Chung.

Christine L. Chung

Senior Vice President of China Operations

Thanks, Peony. It has been an eventful quarter for us in China. Publication of data from the 2 China-only Phase III studies in the New England Journal of Medicine was a landmark event, which was celebrated

in China with much enthusiasm. The Chinese nephrology community envisions itself as leading the way internationally in the adoption of a transformative new paradigm for the treatment of anemia in CKD.

With the expansion of the China label to include nondialysis, our partnership with AstraZeneca is serving us well. We are able to leverage the significant commercialization capability and launch experience of what is now the largest multinational pharma in China, with coverage at over 6,000 hospitals that represent the vast majority of the potential market for roxadustat. FibroGen in China has responsibility for medical affairs, and we, too, have expanded our key opinion leader coverage and evidence generation activities over the last few years from the original 30 Phase III clinical trial sites to now over 300 leading hospitals and counting.

As a joint team, we continue to advance our efforts in market development, distribution, reimbursement and gaining listings in hospitals. China, as the first launch market for roxadustat, has given us some very encouraging early signals about prescriber and patient receptivity, indicators which are helping us calibrate the scale and scope of our ambitions for the market. Looking at the different segments of the potential patient universe.

In dialysis, the installed base of over 600,000 patients is now the single -- the largest single country dialysis population of the world, exceeding that of the United States. This is a substitution market for roxadustat. Treatment of anemia is well established, but only 1/5 of patients are treated to the target hemoglobin [of 11] . There continues to be double-digit growth in dialysis. After accounting for deaths, nearly 100,000 new patients come on to dialysis each year. They represent new candidates for roxadustat, and many have no prior ESA experience.

Within dialysis is approximately 100,000 patients or 14% who are treated on peritoneal dialysis, PD instead of hemodialysis, HD. We believe this segment is particularly well suited for an oral therapeutic like roxadustat because patients receive PD treatment at home. Finally, the nondialysis segment is even bigger in patient count, but ESA use is much less established. We believe, as an oral therapy, roxadustat has the opportunity to greatly expand the addressable market. We expect to know by the end of 2019 if roxadustat will be included in the updated National Reimbursement Drug List or NRDL. Inclusion would be an important inflection point for the business as it would greatly increase patient affordability, accelerate hospital listings and expand overall market adoption. This remains a stretch goal as historically, the NRDL cycles were farther part in time and drugs were on the market for a few years before inclusion.

In the event roxadustat is not admitted in this round, reimbursement would be a top priority for us in 2020. We look forward to keeping you updated on the exciting market opportunity in front of us in China.

With this, I'll turn it over to Elias to describe [this] development in pamrevlumab.

Elias Kouchakji

Senior Vice President of Clinical Development, Drug Safety & Pharmacovigilance

Thank you, Chris, and good afternoon. I'd like to start with introduction of pamrevlumab. It is the first-in-class fully human monoclonal antibody that inhibit the activity of connected tissue growth factors, also known as CTGF. It's a critical mediators of the progression of fibrosis in fibroproliferative diseases.

Pamrevlumab is currently in Phase III clinical development for the treatment of both idiopathic pulmonary fibrosis, IPF, and unresectable locally advanced pancreatic cancer, also known as LAPC. Pamrevlumab is in the Phase II for the treatment of the Duchenne muscular dystrophy in nonambulatory patients. These diseases share a commonality of fibrosis involvement, and each represent an area of significant unmet medical needs in which these patients face a dire prognosis.

I would like to start with an update on IPF. In July, we dosed the first patient in the ZEPHYRUS Phase III clinical study of pamrevlumab in patients with IPF. We continue to activate additional sites in this study and engage with our investigators to enroll patients. We are redoubling our efforts in improving our processes to bring sites online and expect an acceleration over the next few months. Our focus now is to activate sites with the expectation that the enrollment will accelerate in the year of 2020. In September, as Jim mentioned, we announced The Lancet Respiratory Medicine Publication of positive results from the company's PRAISE Phase II clinical study in IPF, showing both significant improvement in the primary

efficacy endpoint of FVC change from baseline and reduction in disease progression in quantitative lung fibrosis as measured by HRCT, also known as high-resolution CT scan.

This paper was well received by the medical community at the 2019 European Respiratory Society International Congress. We are very appreciative and encouraged by this reception. In this publication, the authors reported that pamrevlumab demonstrated the potential for stabilization of disease and for the first time in human studies, the potential reversal of lung fibrosis in some patients.

I'd like to remind everyone that pamrevlumab has received Orphan Drug and Fast Track designation from the FDA for the treatment of IPF.

Moving to LAPC. Our Phase II results showed encouraging clinical evidence of potential of pamrevlumab plus chemotherapy to transform unresectable LAPC patient into patients who are eligible for surgical resection. We recently announced that the first patient was dosed in LAPIS our pivotal Phase III randomized, double-blind, placebo-controlled study, evaluating pamrevlumab as a new adjuvant therapy for unresectable LAPC patients. This study will enroll 260 patients approximately, to receive chemotherapy of gemcitabine and nab-paclitaxel and will be randomized to either pamrevlumab or placebo.

As you may know, this is a very sick patient with limited options. With a primary endpoint of overall survival, at the end of the treatment period, we will be evaluating the rate of resection as a surrogate endpoint for a potential accelerated approval. Similar to IPF, pamrevlumab have received both Orphan Drug and Fast Track designation from the FDA for the treatment of this disease.

Turning to the Duchenne muscular dystrophy, we will meet with the FDA this quarter to discuss the design of our pivotal Phase III program in DMD. We look forward to updating you in the future as this program advances. Also, we plan in the near future to publish additional data from patients who have completed 1 year of treatment in our Phase II study. Pamrevlumab has received Orphan Drug Designation from the FDA for the treatment of DMD.

In clinical study, in multiple indications, pamrevlumab has consistently shown positive efficacy results, has demonstrated a good safety and tolerability profile. We are pleased to be progressing with the Phase III studies.

To fulfill the vision of our late CEO, Tom Neff, whose goal in founding FibroGen was to treat fibrotic diseases. We look forward to updating you on the progress of the pamrevlumab program in the future.

I will turn now the call to our CFO, Pat Cotroneo for the financial update. Pat?

Pat Cotroneo

Senior VP of Finance & CFO

Thank you, Elias. As announced today, total revenue for the quarter ended September 30, 2019, was \$33.2 million as compared to \$29 million for the third quarter of 2018. For the same period, operating costs and expenses were \$86 million and net loss was \$49.4 million or \$0.57 per basic and diluted share as compared to operating costs and expenses of \$71.8 million and a net loss of \$42.6 million or \$0.50 per basic and diluted share for the third quarter last year. Included in revenue for the quarter ended September 30, 2019, are first commercial sales of roxadustat drug product in China. The related net product revenue was \$600,000 for the quarter. Also, included in operating costs and expenses for the quarter ended September 30, 2019, was an aggregate noncash portion totaling \$19.6 million, of which \$14.8 million was a result of stock-based compensation expense as compared to an aggregate noncash portion of \$16 million, of which \$14.3 million was a result of stock-based compensation expense for the same period in the prior year.

As stated in Q2 2019, in accordance with the U.S. GAAP, we have included our revenue recognition methodology, a total of \$180 million comprised of \$50 million for an anticipated milestone from AstraZeneca relating to the filing of the U.S. NDA and \$130 million in anticipated milestones from Astellas in connection with the EU MAA filings when such milestone achievements became probable. Included in our third quarter revenue recognition methodology is a \$12.5 million milestone associated with the approval for CKD in dialysis patients in Japan. The timing of when the payments related to these

milestones will be remitted to FibroGen depends when the milestones are actually achieved. As noted earlier on this call, our NDA submission is targeted for Q4 this year and we expect the Astellas MAA submission to occur in the second half of the Astellas 2019 fiscal year, which ends at March 31, 2020. Based on our latest forecast, we estimate our 2019 ending cash to be in the range of \$650 million to \$660 million, and this range includes the \$50 million U.S. NDA milestone.

At September 30, 2019, FibroGen had \$666.5 million in cash, restricted time deposits, cash equivalents, investments and receivables.

Thank you. And I would now like to turn the call back over to Jim.

James A. Schoeneck

Chairman of the Board

As you have heard, we've made significant progress over the past few months. Looking forward, we will continue to drive our products, programs and organization. Here are some of our areas of focus: first, FibroGen's board and our Search Committee has initiated a search to find a truly exceptional leader to be FibroGen's permanent CEO. We'll update you as we have more news of our selection.

For pamrevlumab, we're enrolling our Phase III studies for both IPF and locally advanced pancreatic cancer and will focus on opening additional study sites and increasing patient enrollment. We also look forward to discussions with the FDA to determine the next steps in our Duchenne Muscular Dystrophy program.

In China, our focus is on securing reimbursement and the upcoming roxadustat launch. We look forward to updating you on that progress in the coming months as well. For roxadustat, we are completing our NDA submission in conjunction with AstraZeneca and plan to file by the end of this quarter, followed by the European MAA submission through our partner Astellas by March of 2020.

As Pat mentioned, FibroGen is eligible to receive \$180 million in filing milestones from our partners, and we are also eligible to receive similar scope approval milestones. Finally, we plan to submit the data just presented at the ASN for publication, and we'll continue to seek out new indications for roxadustat with our programs in MDS and CIA. At this point, I'd like to open up the call for questions.

Question and Answer

Operator

[Operator Instructions]

And your first question comes from Michael Yee.

Michael Jonathan Yee

Jefferies LLC, Research Division

Congrats on the progress. I know Tom would have been proud had he been there, and congrats on all the progress. Two questions. One is for Peony. I would just like to understand, since there seems to be some investor concern about FDA agreements and FDA sign-off [from] statistical [stance] , how your general impression was of your meeting with the FDA? And why you feel confident about statistical protocols and their signing off of what you have from statistics and why you feel good about that?

And my second question is for Jim. In your seat, although I appreciate you're the interim CEO, perhaps you could talk about what your priorities are and what the Board's priorities are at this point given where the stock is at, where things are, I guess what you're thinking about in terms of priorities from here. I appreciate it.

K. Peony Yu

Chief Medical Officer

Mike, thank you for the [good] question. First of all, I wanted to share that we have been in dialogue with the FDA in the past 6 years. And there has been a very good understanding about what the Phase III required study would look like and including the size of the study, how to power it [for example] what's the primary endpoint and we agree on time to meet at the primary endpoint, and that's how we power for the non-dialysis and the dialysis. And we've also had a very productive dialogue with the FDA on the analysis of cardiovascular safety as well as what the efficacy requirement needs to be for this submission. And the most recent conversation with the FDA was at the end of July. And we had sent it to the FDA, a fairly comprehensive briefing package and had a very productive meeting. And walking out of it, we felt that we had all the guidance from the FDA we needed to put together a winning submission. And that is about to be out the door this quarter.

Michael Jonathan Yee

Jefferies LLC, Research Division

So you feel no issue or no real concern about the hazard ratios and the [upper bounds] and all the things that people are talking about? You look at diabetes programs and things like that, there's -- you're well within that. So you don't feel any concern about that?

K. Peony Yu

Chief Medical Officer

No, we have no concern about that. And Mike, as you know, that our regulatory assessment is not based on 1 criterion. But instead, it is based on totality of evidence such as efficacy, safety, what is the medical need. And so based on our discussions and the historical precedents in this therapeutic area and the various conversations we've had with the agency, we are very comfortable with our data where it is now.

Michael Jonathan Yee

Jefferies LLC, Research Division

Okay. And Jim, just that question for you.

James A. Schoeneck

Chairman of the Board

And Mike, I think our focus is very clear as I mentioned through the -- my closing remarks, I mean first and foremost, it's filing of the NDA; second, it's filing through Astellas, the MAA in Europe. Behind that is China, and they're securing reimbursement, along with the support and our participation in the China launch. And with pamrevlumab, it's around accelerating both the number of sites and the enrollment in our 2 Phase III studies and getting agreement with the FDA on where we're taking the DMD program next. I think beyond that, working with the rest of the board, it's finding a very capable person to step in and lead the company longer term.

Operator

And your next question comes from Geoffrey Porges.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

I just wanted to also share my sadness and sympathy about Tom and particularly important that given all the recognition and the progress that you've made with roxadustat and pamrevlumab. So 1 question for Peony, if I may, one Chris -- question for Chris. Peony, could you share the number of patients in the non-dialysis cohorts that progressed [to] dialysis and the difference in timing in the progression of dialysis and perhaps comment about whether the patient's post progression of dialysis, presumably were treated with EPO and behaved in the same way as the incident dialysis patients. And so was there a benefit from the comparison between roxa and EPO in relation to progressed?

And then Chris, could you talk a little bit more about the NRDL listings, specifically have you applied for both dialysis and non-dialysis? And what is the size of the non-dialysis patient population who are anemic enough to justify treatment with innovative drugs such as roxa?

K. Peony Yu

Chief Medical Officer

Geoff, you asked a lot of this -- I noticed that the question was more than one. So I think that it is correct to expect that when 40% of the -- all of the non-dialysis patient pool were indeed already -- had already reached end-stage kidney disease, meaning eGFR being below 15, then you do expect some patients to require dialysis treatment in this long-term outcome program. And so we are -- now the analysis of these patients is important because transition -- that represents a transition to dialysis. And we have not had a chance. As you see, we have presented a lot of data at the ASN. We have not had a chance to write this one up yet, and we agree with you, this is important that we should present in future medical conferences or publications. It's a little bit complicated to report that at a Q&A at -- over here.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

[indiscernible] Was there a benefit in time?

K. Peony Yu

Chief Medical Officer

I'm sorry?

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Was there a benefit at least in time? Was there a significant difference in the time to progress to dialysis between the 2 cohorts?

K. Peony Yu

Chief Medical Officer

Based on the results from the eGFR change, we believe there should be, but the data needs to -- needs further analysis as mainly because the time on treatment between roxadustat and placebo differ.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Okay. Chris, I'd love to hear from you about NRDL.

Christine L. Chung

Senior Vice President of China Operations

Hi, Geoff. So your first question, I believe, is whether roxadustat was invited by the Chinese government to NRDL negotiations.

So first of all, you're absolutely right. A sponsor is invited. You don't proactively apply. So I think consistent with what AstraZeneca, our partners, have said, the 2 companies are collectively putting a lot of effort in getting into NRDL. At this point in time, we're not discussing if there's an invitation primarily because all invitations either to roxadustat or to other companies are considered confidential. And the Chinese government has not published a list of companies invited to negotiate. So I would prefer to wait until the end of the year when the outcomes in NRDL is disclosed. I hope you understand.

With regard to the second question, I believe the question was, what is the size -- potential market size of non-dialysis. So I had mentioned just now in my section of the script that there are over 600,000 dialysis patients in China, 90% to 95% of them are anemic. In non-dialysis, if you look at the CKD population, it's actually 120 million, of course mostly, they are early stage, and they're not necessarily anemic. If you look at Stage IIIb, it's about 50%; Stage IV, about 70%; Stage V, non-dialysis is about 90%. If you add those numbers up based on the real world evidence data that we have, measurement hemoglobin 10 and below, we believe the addressable market in China for non-dialysis anemic patients below hemoglobin 8 is close to 2 million patients. It's a substantial population. And Geoff, we're very excited because we have an oral therapeutic with a safety profile that we think would greatly expand the addressable market.

Operator

And your next question comes from Adam Walsh.

Xiaodong Zhang

Stifel, Nicolaus & Company, Incorporated, Research Division

This is Edwin on for Adam. First question maybe for Peony. For the individual MACE component in the NDD, I guess the events for myocardial infarction and stroke in that data set [have more] , and FDA will focus on the MACE composite. Can you please further clarify on this NDD MACE data set?

K. Peonv Yu

Chief Medical Officer

Yes. So I wanted to reiterate that in our conversation with the FDA, the primary safety endpoint was the composite MACE, and there was never any requirement stated for us to -- for -- on the individual component itself. And I also, again, remind ourselves that these numbers are fairly -- the number of events are fairly small. And that -- now another thing to point out is that the lower bound of the 95% confidence intervals on each of these individual components are below 1.0, which is very different than the [stroke in treat] . And we are looking at the overall picture and the overall safety profile of the drug looking at efficacy, safety as well as what -- how little is on the market for treating the non-dialysis patients.

Xiaodong Zhang

Stifel, Nicolaus & Company, Incorporated, Research Division

Okay. My second question is when are you going to talk about the [the job] as stat plan? I mean the statistical analysis plan, including the non-inferiority margin. Is there any pre-planned FDA meeting in the coming weeks?

K. Peony Yu

Chief Medical Officer

I am sorry about the questions. Are you asking when we will publish these results? We do plan to write it up as soon as we can and put it in a scientific journal.

James A. Schoeneck

Chairman of the Board

I think -- Adam (sic) [Edwin], I think is -- the question is when will we talk to the FDA about the statistics and the analytical plan is the question.

Xiaodong Zhang

Stifel, Nicolaus & Company, Incorporated, Research Division

Right.

James A. Schoeneck

Chairman of the Board

We plan to talk to them in the coming weeks.

K. Peony Yu

Chief Medical Officer

Okay. So the answer to that question is that we had already talked with the FDA about analytical plan, and we had made the agreement on the analysis plan. The results that we have presented in the high-impact clinical session at the ASN, and the numbers I had just presented were based on the agreed analysis plan that we have made with the FDA.

Xiaodong Zhang

Stifel, Nicolaus & Company, Incorporated, Research Division

So the noninferiority margin of [1.3] is already in agreement or not?

K. Peony Yu

Chief Medical Officer

So we are talking about the analysis plan, meaning how do you pool, what's the pooling strategy and the analysis plan, how to analyze the data. When you talk about NI margins, you're talking about the standard for assessment, right? And as I mentioned earlier, that we expect that [all] regulators will assess the data based on the very -- all the -- on the entire application of the NDA. And based on our dialogue with FDA over the past 6 years and the data, as we have shown, we are confident that we do have what it takes for this drug to be favorably evaluated.

Xiaodong Zhang

Stifel, Nicolaus & Company, Incorporated, Research Division

All right. Maybe another question for Chris, regarding the China market. Can you help us understand more of the self-pay market there? And how do you and AstraZeneca book revenue and cost in China? Is it 50-50?

Christine L. Chung

Senior Vice President of China Operations

So Edwin with regard to the first question about the self-pay market, so the self-pay market is not large. And this is why getting into NRDL, it's an important inflection point for the business. The self-pay market is basically people not getting reimbursement and choosing to pay 100% out-of-pocket at a price, and it's visible to the market for a roxadustat drug that is higher than the standard of care. We have sales at this point in time, so there is a self-pay market, but we do not expect it to be substantial because of the differential in pricing.

With regard to revenue recognition, FibroGen is the marketing authorization holder of roxadustat in China. And under the 2 invoices role, it is the manufacturing -- it's the marketing authorization holder that books

revenues. We have a 50-50 profit share with AstraZeneca. So that is how the 50-50 works. It's not a 50-50 split of the top line, it's the 50-50 split of the profits.

Operator

And your next question comes from Danielle Brill.

Nirav Y. Shelat

Piper Sandler & Co., Research Division

Congratulations on the data. I just had a couple of questions. This is Nirav on for Danielle, by the way. I was just wondering, would you be able to talk a little about whether you're expecting priority review or a normal review with the NDA? And if you'd be willing to use a priority review voucher?

K. Peony Yu

Chief Medical Officer

This is a very good question. And we believe that the basis for a priority review could be because we have a new innovative drug that is potentially better than what is available for treating diseases in patients with a serious condition. However, the decision whether to grant us priority review is [that one] of the FDA.

James A. Schoeneck

Chairman of the Board

So Nirav, your -- the second part of your question, I would not see us using a priority review voucher, but we will and request priority review.

Nirav Y. Shelat

Piper Sandler & Co., Research Division

Okay, I see. That's helpful. And I guess my second question would be, would you be able to give us just some color on the MDS study? Just how it's going, how the enrollment is going and when we should expect data? And along with other agents that are currently in the pipeline for the indication as well, how do you see roxadustat sort of [fitting] in from a strategic standpoint?

K. Peony Yu

Chief Medical Officer

Good question. We do -- we are seeing encouraging data from the open-label portion of our Phase III study, which is what we will be presenting in the upcoming ASH. And since the other -- so in terms of the competitive landscape, we believe that because MDS is such a -- MDS anemia is a condition that there is so much need and so difficult to treat, we believe that there is still opportunity for us to make a difference in these patients. And the enrollment is ongoing. And we will come back with a -- in the future, the time line on when the study will be completed.

Operator

And your next question comes from Paul Choi.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

My first question is for Peony. And you did state earlier that the non-dialysis population was not powered to individually assess the various components of MACE. But given the background of the patient population in terms of their eGFR level, can you give us -- what is your understanding with regard to the FDA's position on the individual components with respect to when a trial is not powered to show a statistical difference on those individual points, given the patient's background population? And then I had a second commercial question on the NRDL.

K. Peony Yu

Chief Medical Officer

So to -- we can share our view on the individual components and what's the discussion with the FDA in terms of the requirement for our primary safety endpoint. And as I stated earlier, there was never any explicit expectation on the individual components. Now -- but we do believe that the evaluation of the data has to take into account the overall benefit risk of the drug for the patient. So I hope this answer the question.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Yes. And then on the NRDL, I know you stated you haven't -- you won't formally communicate whether roxadustat is under invitation to be considered. But assuming it is under consideration, I guess, as you think about potential reference pricing in the competitive landscape, given the wide availability of EPO in China, can you maybe give us what you think of reasonable range is potentially for pricing on the goforward given the availability and pricing of EPO in the China market?

Christine L. Chung

Senior Vice President of China Operations

Absolutely, Paul. So the way we think about pricing in China is as follows. So first of all, as value-based pricing, we evaluate the scope of unmet medical need and the pharmacoeconomic consequences of not treating or not treating optimally or not treating safely. We then compared the clinical efficacy benefits of roxadustat based on the China Phase III studies over ESAs, and then we looked at the safety advantages over ESAs. And this is all about differentiation on a clinical basis. We also, with AstraZeneca, believe that roxadustat as a first-in-class drug and a patented first-in-class drug, of course, to state the obvious, deserves an innovation premium because we are bringing a transformative new treatment paradigm to China, that above and beyond the clinical benefit to the patient in a quantifiable unmet medical need, also supports the country's policy direction of encouraging innovation. So we're hopeful that roxadustat could become an example of company bringing innovation to China and expecting a return for that delivery. We do not see ourselves being benchmarked against locally manufactured ESA because we think we're a highly differentiated product with clinical benefits, and we believe we deserve an innovation premium.

Obviously, Paul, at the end of the day, it's about budgetary concerns and budgetary considerations of the Chinese government and affordability for the patient. So at the end of the day, should there be an NRDL negotiations, pricing would not just be what we would like to assert but what the country can actually afford. So we'd be eager to see what that balance is should there be an NRDL negotiation, but that is our pricing strategy in terms of what we believe is a fair pricing for roxadustat.

Operator

And your next question comes from Mr. Joel Beatty.

Joel Lawrence Beatty

Citigroup Inc, Research Division

All right. Great. So the -- my first question is on the quality of life benefit from the Phase III program. I believe that there was some initial data presented in the top line data, but then I didn't see anything on quality of life at ASN. Should we still consider the quality of life effect to be in line with the top line press release? And how important will low quality of life data from the Phase III program be for marketing the drug?

K. Peony Yu

Chief Medical Officer

Joe, it is great questions. Yes, our data is consistent with what we had reported in top line. And we just have so much to put together for the ASN, and we do look forward to present the results in future conferences and publications. As you know, one of the manifestations of anemia is -- for patients is fatigue and largely, quality of life. Thank you.

Joel Lawrence Beatty

Citigroup Inc, Research Division

Great. And then maybe one other question. Can you tell us about the indication you plan to pursue for roxadustat?

K. Peony Yu

Chief Medical Officer

Yes. So we and our partners believe that roxadustat has the potential to become the anemia drug for various kinds of anemia beyond CKD. And as we have presented, we already have ongoing trial in MDS anemia and in chemotherapy-induced anemia. And there are additional anemia types that are in consideration, such as anemia in multiple myeloma patients and anemia of inflammation. There has been extensive effort to evaluate all these types of anemia and more.

Operator

And there are no questions at this time.

James A. Schoeneck

Chairman of the Board

Well, in closing, I'd like to thank you for your attention and support. I also want to thank the senior management team and all of the dedicated employees at FibroGen in the U.S. and in China, who are committed to bringing novel innovative medicines to patients around the world, fulfilling the vision that Tom set for the company 25 years ago. Thank you.

Operator

Thank you, ladies and gentlemen. This concludes today's conference. Thank you for participating. You may now disconnect.

8. Related Party Transactions

Astellas is an equity investor in the Company and considered a related party. The Company recorded revenue related to collaboration agreements with Astellas of \$15.5 million and \$5.1 million for the three months ended September 30, 2019 and 2018, respectively, and \$155.0 million and \$30.8 million for the nine months ended September 30, 2019 and 2018, respectively.

The Company recorded expense related to collaboration agreements with Astellas of \$0.9 million and \$0.4 million during the three months ended September 30, 2019 and 2018, respectively, and \$2.2 million and \$1.1 million during the nine months ended September 30, 2019 and 2018.

As of September 30, 2019 and December 31, 2018, accounts receivable from Astellas were \$17.7 million and \$47.2 million, respectively, and amounts due to Astellas were \$1.7 million and \$0.4 million, respectively. The accounts receivable from Astellas as of September 30, 2019 included \$12.5 million of the milestone payment the Japan Agreement related to Japan's NDA approval by the Ministry of Health, Labour and Welfare for the treatment of anemia associated with CKD in dialysis patients. The accounts receivable from Astellas as of December 31, 2018 included \$43.8 million related to the delivery of roxadustat active pharmaceutical ingredients to Astellas during the fourth quarter of 2018, pursuant to an amendment to the Japan Agreement that will allow Astellas to manufacture roxadustat drug product for commercialization in Japan. This amount was received during the first quarter of 2019.

Prepaid expenses and other current assets as of September 30, 2019 included \$126.0 million of net unbilled contract asset, representing a \$130.0 million unbilled contract asset related to two regulatory milestones under the Europe Agreement with Astellas associated with the planned MAA submission to the EMA, net of \$4.0 million of associated deferred revenue. See Note 2 for details. According to the Europe Agreement, this \$130.0 million is not billable to Astellas until the submission of an MAA, therefore the net contract asset was included in the prepaid expenses and other current assets line on the Company's condensed consolidated balance sheet as of September 30, 2019. There was no such contract asset balance as of December 31, 2018.

ITEM 2. MANAGEMENT'S DISCUSSION AND ANALYSIS OF FINANCIAL CONDITION AND RESULTS OF OPERATIONS.

You should read the following discussion and analysis of our financial condition and results of operations in conjunction with the condensed consolidated financial statements and the notes thereto included elsewhere in this Quarterly Report on Form 10-Q, and in our Securities and Exchange Commission ("SEC") filings, including our Annual Report on Form 10-K for the year ended December 31, 2018 filed with the SEC on February 27, 2019.

FORWARD-LOOKING STATEMENTS

The following discussion and information contained elsewhere in this Quarterly Report on Form 10-Q contain "forward-looking statements" within the meaning of Section 21E of the Securities Exchange Act of 1934, as amended ("Exchange Act"), Section 27A of the Securities Act of 1933, as amended ("Securities Act") and within the meaning of the Private Securities Litigation Reform Act of 1995. These statements are often identified by the use of words such as "may," "will," "expect," "believe," "anticipate," "intend," "could," "should," "estimate," or "continue," and similar expressions or variations. Such forward-looking statements are subject to risks, uncertainties and other factors that could cause actual results and the timing of certain events to differ materially from future results expressed or implied by such forward-looking statements. Factors that could cause or contribute to such differences include, but are not limited to, those discussed in the section titled "Risk Factors," set forth in Part II, Item 1A of this Quarterly Report on Form 10-Q. The forward-looking statements in this Quarterly Report on Form 10-Q represent our views as of the date of this Quarterly Report on Form 10-Q. We anticipate that subsequent events and developments will cause our views to change. New risks emerge from time to time, and it is not possible for our management to predict all risks, nor can we assess the impact of all factors on our business or the extent to which any factor, or combination of factors, may cause actual results to differ materially from those contained in any forward-looking statements we may make. In light of these risks, uncertainties, and assumptions, the forward-looking events and circumstances discussed in this Quarterly Report on Form 10-Q may not occur, and actual results could differ materially and adversely from those anticipated or implied in the forward-looking statements. While we may elect to update these forward-looking statements at some point in the future, we have no current intention of doing so except to the extent required by applicable law. You should, therefore, not rely on these forward-looking statements as representing our views as of any date subsequent to the date of this Quarterly Report on Form 10-Q and are cautioned not to place undue reliance on such forward-looking statements.

BUSINESS OVERVIEW

We were incorporated in 1993 in Delaware and are headquartered in San Francisco, California, with subsidiary offices in Beijing and Shanghai, People's Republic of China ("China"). We are a leading biopharmaceutical company discovering and developing a pipeline of first-in-class therapeutics. We apply our pioneering expertise in hypoxia-inducible factor ("HIF"), connective tissue growth factor ("CTGF") biology, and clinical development to advance innovative medicines for the treatment of anemia, fibrotic disease, and cancer. Roxadustat, our most advanced product, is an oral small molecule inhibitor of HIF prolyl hydroxylase ("HIF-PH") activity, completing Phase 3 clinical development for the treatment of anemia in chronic kidney disease ("CKD"), with a New Drug Application ("NDA") now approved in China in dialysis patients and non-dialysis patients and in Japan for dialysis patients. We and our collaboration partners AstraZeneca AB ("AstraZeneca") and Astellas Pharma Inc. ("Astellas") are in the process of preparing an NDA for submission to the United States ("U.S.") Food and Drug Administration ("FDA") and a Marketing Authorization Application ("MAA") for submission to the European Medicines Agency ("EMA"). Roxadustat is in Phase 3 clinical development in China for anemia associated with myelodysplastic syndromes ("MDS"). Roxadustat is in Phase 2 clinical development for chemotherapy-induced anemia. Pamrevlumab, an anti-CTGF human monoclonal antibody, is in Phase 3 clinical development for the treatment of both idiopathic pulmonary fibrosis ("IPF") and pancreatic cancer. Pamrevlumab is also currently in a Phase 2 trial for Duchenne muscular dystrophy ("DMD"). We are also developing a biosynthetic cornea in China.

Our revenue for the three and nine months ended September 30, 2019 increased compared to the same periods a year ago. Our revenue for the three and nine months ended September 30, 2019 included the recognition substantially all of \$12.5 million of a regulatory milestone that was included in the transaction price during the third quarter of 2019 when this milestone was achieved. This milestone is associated with the NDA approval in Japan under the collaboration agreement with Astellas for roxadustat as the treatment for dialysis CKD patients. In addition, our revenue for the nine months ended September 30, 2019 included of the recognition of \$129.0 million of two regulatory milestones totaling \$130.0 million that were included in the transaction price during the second quarter of 2019 when these milestones became probable of being achieved. These milestones are associated with the planned MAA submission to the EMA under the collaboration agreement with Astellas for roxadustat as a treatment for dialysis and non-dialysis CKD patients. Our revenue recognized during the nine months ended September 30, 2019 also included the recognition of \$42.1 million of a \$50.0 million regulatory milestone that was included in the transaction price during the second quarter of 2019 when this milestone became probable of being achieved. This milestone is associated with the planned NDA submission to the FDA under the collaboration agreement with AstraZeneca for roxadustat as a treatment for dialysis and non-dialysis CKD patients. As comparison, our revenue for the prior year period included the recognition of \$14.9 million of a \$15.0 million regulatory milestone associated with NDA submission in Japan under the collaboration agreement with Astellas for roxadustat for the treatment of anemia in Japan that was included in the transaction price during the second quarter of 2018 when this milestone became probable of being achieved. The increases were partially offset by a decrease in co-development billings related to the development

Operating costs and expenses for the three months ended September 30, 2019 increased compared to the same period a year ago primarily due to \$20.2 million higher outside service expenses related to co-promotional activities and scientific contract expenses, \$2.6 million amortization of finance lease right-of-use ("ROU") assets related to the adoption of lease accounting guidance under Accounting Standards Codification ("ASC") 842 - Leases ("ASC 842"), \$1.6 million higher depreciation expenses mainly due to the change in estimated useful life for our leasehold improvements as a result of the adoption of ASC 842, and \$1.4 million higher legal expenses mainly associated with patent-related and international activities. The increases were partially offset by \$5.5 million lower drug development expenses associated with drug substance manufacturing activities related to pamrevlumab, \$4.7 million lower clinical trial expenses related to lower activities for roxadustat offset by higher activities for pamrevlumab, and \$3.7 million capitalization of inventory manufacturing costs.

Operating costs and expenses for the nine months ended September 30, 2019 increased compared to the same period a year ago primarily due to \$31.7 million higher outside service expenses related to co-promotional activities and scientific contract expenses, \$10.4 million higher stock-based compensation related to the cumulative impact of stock option grant activities, \$7.8 million amortization of finance lease ROU assets related to the adoption of lease accounting guidance under ASC 842, \$3.9 million higher depreciation expenses mainly due to the change in estimated useful life for our leasehold improvements as a result of the adoption of ASC 842, \$2.9 million higher legal expenses mainly associated with patent-related and international activities, and \$2.4 million higher employee-related expenses resulting from higher average compensation level. The increases were partially offset by \$16.4 million lower clinical trial expenses related to lower activities for roxadustat offset by higher activities for pamrevlumab, \$11.7 million lower drug development expenses associated with drug substance manufacturing activities related to pamrevlumab, and \$4.3 million capitalization of inventory manufacturing costs.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 151 of 1730

Table of Contents

During the three months ended September 30, 2019, we had a net loss of \$49.4 million, or net loss per basic and diluted share of \$0.57, as compared to a net loss of \$42.6 million for the same period a year ago, due to an increase in operating costs and expenses partially offset by an increase in revenue. During the nine months ended September 30, 2019, we had a net income of \$21.2 million, or net income per basic share of \$0.24, and net income per diluted share of \$0.23, as compared to a net loss of \$107.4 million for the same period a year ago, due to an increase in revenue partially offset by an increase in operating costs and expenses.

Cash and cash equivalents, investments and accounts receivable totaled \$658.9 million at September 30, 2019, a decrease of \$82.0 million from December 31, 2018, primarily due to the cash used in operations, partially offset by the accounts receivable at December 31, 2018 collected during the year.

Research, Development and Commercial Programs

Roxadustat for the Treatment of Anemia in Chronic Kidney Disease

Roxadustat is our most advanced product, an oral small molecule inhibitor of HIF-PH activity that acts by stimulating the body's natural pathway of erythropoiesis, or red blood cell production. In August 2019, roxadustat (China tradename: 爱瑞卓®) received marketing authorization in China for the treatment of anemia caused by CKD in non-dialysis patients (adding non-dialysis to the label for dialysis which was approved in 2018). In September 2019, roxadustat (Japan tradename Evrenzo®) was approved in Japan for the treatment of anemia associated with CKD in dialysis patients.

We have reported top line efficacy data from individual studies from the roxadustat Phase 3 trials in December 2018, and top line pooled cardiovascular safety data in May 2019. We recently reported additional individual study data and pooled safety data at the American Society of Nephrology Kidney Week 2019. We expect these data will serve as the basis to submit the roxadustat U.S. NDA in the fourth quarter of 2019 for CKD anemia in both dialysis and non-dialysis patients, followed by the MAA in Europe in the first quarter of 2020.

· Pooled Efficacy Data

In addition to meeting the U.S. primary efficacy endpoint in each of six individual Phase 3 studies, roxadustat superiority over placebo was demonstrated in the primary endpoint as the mean change in hemoglobin (from baseline to the average between weeks 28-52) was significantly larger than placebo (1.85 g/dL vs. 0.13 g/dL, p<0.001) in the non-dialysis pool (4,277 patients from OLYMPUS, ANDES, and ALPS). In addition, the mean change in hemoglobin (from baseline to the average between weeks 28-52) in roxadustat patients was significantly larger than in epoetin alfa patients (1.22 g/dL vs. 0.99 g/dL, p<0.001) in the pooled dialysis studies (3,857 patients from HIMALAYAS, SIERRAS, and ROCKIES).

o Patients with Inflammation

In a subgroup of dialysis patients with inflammation (C-reactive protein ("CRP") levels over 4.9 mg/L), the mean change in hemoglobin (from baseline to the average between weeks 28-52) was significantly higher in roxadustat-treated patients (1.29 g/dL) than epoetin alfa treated patients (0.96 g/dL, p<0.0001).

o Intravenous ("IV") Iron Requirement; Efficacy Irrespective of Iron Replete Status

In non-dialysis, roxadustat increased hemoglobin (by 1.94 g/dL) regardless of whether patients were iron-replete (patients shown to have sufficient baseline stores of iron in their body, TSAT \geq 20% and Ferritin \geq 100 ng/mL) or not iron-replete. In dialysis, less mean monthly IV iron supplementation was required at weeks 28-52 in patients receiving roxadustat versus patients receiving epoetin alfa in pooled analysis, p< 0.0001.

o Risk of Rescue Therapy and Transfusion

The risk of rescue therapy was significantly lower in the roxadustat arm (8.9%) than the placebo arm (31.1%) in the pooled non-dialysis patients with a hazard ratio ("HR") = 0.19 (95% confidence interval "95% CI" of 0.16, 0.23), p<0.0001. The percentage of patients receiving red blood cell transfusions during the first year of treatment was also significantly lower in the roxadustat arm (5.2%) as compared to the placebo arm (15.4%) (HR (95% CI) = 0.26 (0.21, 0.32), p<0.0001).

In the dialysis pool, during the first year of treatment, patients in the roxadustat arm had a lower transfusion risk (9.5%) as compared to the epoetin alfa arm (12.8%) (HR (95% CI) = 0.82 (0.679, 0.997), p=0.046).

o Reduction of Decline in Kidney Function as Measured by eGFR

In a post hoc subgroup analysis of 2,438 non-dialysis patients with baseline eGFR≥15, the one-year decline in estimated glomerular filtration rate ("eGFR," a measure of the filtration function of kidney and renal disease progression) in roxadustat treated patients (-2.8) was significantly less than that in placebo treated patients (-4.4), with a treatment difference of 1.6 mL/min/1.73m² (p<0.0001).

o Reduction of LDL Cholesterol

In the pooled non-dialysis patients, roxadustat lowered low-density lipoproteins ("LDL"), with a mean change from baseline of -17.06 mg/dL compared to an increase of 1.30 mg/dL for placebo patients, a significant treatment difference of -19.83 mg/dL (p<0.0001).

• Pooled Cardiovascular Safety Data

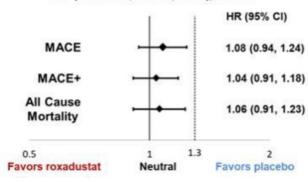

In the U.S., the primary safety endpoint is time to first Major Adverse Cardiovascular Event ("MACE"), a composite endpoint of all-cause mortality, stroke and myocardial infarction. In Europe, the primary safety endpoint is the time to first MACE+ ("MACE+") which, in addition to the components in MACE, also includes hospitalization due to heart failure or unstable angina. However, the FDA in the U.S., and the EMA in Europe, will each review MACE, MACE+, and all-cause mortality separately, in addition to other endpoints.

The below cardiovascular safety analyses reflect the pooling strategy and analytical approach we agreed on with the FDA. Similar sets of analyses will be submitted to the EMA to serve as the basis for potential approval in dialysis and non-dialysis in Europe, and additional supportive analyses and sensitivity analyses as well as subgroup analyses will also be included in the NDA and MAA. However, the FDA and EMA will each conduct their own benefit-risk analysis and may use additional statistical analyses other than those agreed with the FDA or set forth below, including, but not limited to, pre-specified or other analyses that may not sufficiently address the differential drop-out rate between the roxadustat and placebo study arms in non-dialysis.

o Non-Dialysis - Pooled Cardiovascular Safety Data

In our pre-NDA meeting, the FDA agreed that the ITT-analysis would be our primary cardiovascular safety analysis method for non-dialysis in the U.S. as it uses on-treatment and post treatment long term follow-up (until a common study end date) to account for the higher drop-out rate in the placebo arm. The figure below shows that in the 4,270 pooled non-dialysis patients (OLYMPUS, ANDES, and ALPS), the risk of MACE, MACE+, and all-cause mortality in roxadustat patients were comparable to that in placebo patients based on a reference non-inferiority margin of 1.3.

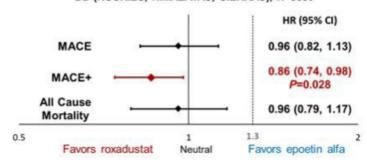

o Dialysis - Pooled Cardiovascular Safety Data

In the pooled analysis of 3,880 dialysis patients (HIMALAYAS, SIERRAS, and ROCKIES), the risk of MACE and all-cause mortality in roxadustat patients were not increased, and roxadustat lowered the risk of MACE+ by 14% compared to the active comparator epoetin alfa, based on a hazard ratio of 0.86 and an upper bound of 95% CI under 1.0. The hazard ratios represent a point estimate of relative risk.

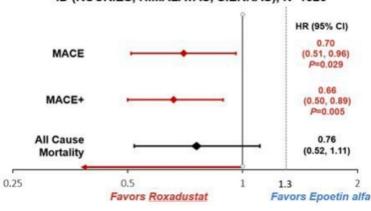

Time to event endpoints using Cox model DD (ROCKIES, HIMALAYAS, SIERRAS), N=3880

o Incident Dialysis Subgroup

In the clinically important subgroup of 1,526 incident dialysis patients, roxadustat reduced the risk of MACE by 30% and MACE+ by 34%, with a trend towards lower all-cause mortality. The lower MACE and MACE+ risks (compared to epoetin alfa) are based on hazard ratios of 0.70 and 0.66, respectively, with the upper bound of 95% CI under 1.0 in both. We believe this incident dialysis subpopulation is the appropriate setting for comparison of roxadustat versus epoetin alfa as anemia therapy often starts early in dialysis treatment, and this period of initial dialysis treatment has substantially increased patient mortality, whereas the stable dialysis population have survived this period and are already shown to be responsive to stable ESA doses.

Data from Individual Studies Presented at ASN

We and our partners also presented data from our individual Phase 3 roxadustat studies at the American Society of Nephrology Kidney Week 2019.

O Non-Dialysis CKD Patients (ANDES) - FibroGen

ANDES is a 922-patient Phase 3, randomized, double-blinded, placebo-controlled trial designed to evaluate the efficacy and safety of roxadustat vs. placebo for the treatment of anemia in patients with later stage CKD (stages 3, 4 or 5) who are not dialysis dependent.

U.S. primary efficacy endpoint: roxadustat was superior to placebo in mean hemoglobin change from baseline to the average over weeks 28 to 52 (2.00 vs. 0.16 g/dL, respectively, p<0.0001).

EU primary efficacy endpoint: a higher proportion of roxadustat-treated patients (86.0%) achieved a hemoglobin response (defined as achieving a hemoglobin level of at least 11 g/dL on two consecutive visits during the first 24-weeks of treatment and a hemoglobin increase of at least 1.0 g/dL in subjects with baseline Hb >8.0 g/dL, or an increase of at least 2.0 g/dL in subjects with baseline Hb \leq 8.0 g/dL), as compared to placebo (6.6%), p=0.0007.

The proportion of subjects who received any rescue therapy (blood/RBC transfusion, ESA use, or IV iron) in the first 52 weeks of treatment was 8.9% in the roxadustat arm vs. 28.9% in the placebo arm (HR (95% CI) = 0.19 (0.138, 0.276), p<0.0001). The proportion of subjects who received blood/RBC transfusion in the first 52 weeks of treatment was 5.6% in the roxadustat arm vs. 15.4% in the placebo arm (HR (95% CI) = 0.26 (0.165, 0.406), p<0.0001).

The mean change in LDL cholesterol from baseline to average over weeks 12-28 was -18.48 mg/dL (n=564) in the roxadustat arm vs. 0.22 mg/dL (n=269) in the placebo arm, with a treatment difference of -17.26 mg/dL (p<0.0001).

In this study, roxadustat-treated patients had a sustained reduction in hepcidin whereas placebo patients did not have a reduction in hepcidin. The mean change from baseline to week 44 was -22.1µg/L in the roxadustat arm vs. 3.88 µg/L in the placebo arm, for a treatment difference between the two arms of -25.71 µg/L (95% CI: -38.523, -12.903).

In this study, subjects in the roxadustat arm had a substantially higher overall study drug exposure compared to subjects in the placebo arm. Study drug discontinuation was higher in the placebo arm compared to roxadustat arm, and the relative difference in discontinuation rates was especially pronounced in the lowest baseline eGFR category. The overall exposure-adjusted safety profile of roxadustat observed during this study was comparable with placebo and consistent with that expected in the CKD study population. The most frequently observed adverse events with roxadustat in this trial were nausea, hyperkalemia, constipation, and hypertension.

o Incident Dialysis CKD Patients Study (HIMALAYAS) - FibroGen

HIMALAYAS is a 1,043-patient Phase 3 randomized, open-label, active-controlled trial to assess the efficacy and safety of roxadustat compared to epoetin alfa, an ESA, for the treatment of anemia in CKD patients who have newly initiated dialysis treatment for end-stage renal disease ("ESRD") and have had minimal or no exposure to an ESA prior to study participation.

U.S. primary efficacy endpoint: the mean hemoglobin change from baseline to the average over weeks 28 to 52 was 2.57 g/dL (roxadustat) vs. 2.36 g/dL (epoetin alfa), a least squares mean difference of 0.18 g/dL, with the 95% CI of (0.08, 0.29). The non-inferiority criteria was met as the lower bound of the 95% CI was well above the non-inferiority margin of -0.75 g/dL, and superiority over epoetin alfa was also achieved, p=0.0005. In subgroup analyses, roxadustat was also superior to epoetin alfa in hemoglobin change from baseline regardless of iron repletion and inflammation status.

EU primary efficacy endpoint: a higher proportion of roxadustat-treated patients (88.2%) achieved a hemoglobin response (defined as achieving a hemoglobin level of at least 11 g/dL on two consecutive visits during the first 24-weeks of treatment and a hemoglobin increase of at least 1.0 g/dL in subjects with baseline Hb \geq 8.0 g/dL), or an increase of at least 2.0 g/dL in subjects with baseline Hb \leq 8.0 g/dL), as compared to an 84.4% responder rate in the epoetin alfa arm, with the lower bound of the 95% CI (-0.7%, 7.7%) of the treatment difference in responder rate well above the non-inferiority margin of -15%.

The most frequently observed adverse events with roxadustat in this trial were hypertension, diarrhea, and muscle spasms. The safety profile of roxadustat in this study was consistent with results from prior roxadustat studies.

Table of Contents

o Stable Dialysis CKD Patients Study (SIERRAS) - FibroGen

SIERRAS is a 741-patient U.S. Phase 3, randomized, open-label, active-controlled trial to assess the efficacy and safety of roxadustat compared to epoetin alfa for the treatment of anemia in dialysis CKD patients who were receiving stable doses of ESA prior to study participation.

U.S. primary efficacy endpoint: the mean hemoglobin change from baseline to the average over weeks 28 to 52 was 0.39 g/dL (roxadustat) vs. -0.09 g/dL (epoetin alfa), a least squares mean treatment difference of 0.48 g/dL (95% CI 0.37, 0.59). Roxadustat met the non-inferiority criteria as the lower bound of 95% CI was well above the non-inferiority margin of -0.75 g/dL. Roxadustat also achieved superiority, p<0.0001.

EU primary efficacy endpoint: the mean hemoglobin change from baseline to the average over weeks 28 to 36 was 0.54 g/dL (roxadustat) vs. -0.03 g/dL (epoetin alfa), a least squares mean treatment difference of 0.54 g/dL with a 95% CI (0.40, 0.69). Roxadustat met the non-inferiority criteria as the lower bound of the 95% CI was well above the non-inferiority margin of -0.75 g/dL. Roxadustat also achieved superiority over epoetin alfa, p<0.0001.

In patients with inflammation (CRP>4.9 mg/L), roxadustat doses for maintaining hemoglobin levels were comparable to those with normal CRP and were stable over time as the effect on hemoglobin was durable, whereas epoetin alfa patients required higher mean doses in inflamed patients (CRP>4.9 mg/L), doses which increased by approximately 50% from baseline after about one year. In these inflamed patients (CRP>4.9 mg/L) mean change in hemoglobin from baseline to week 18-24 was 0.61 g/dL in roxadustat vs. -0.03 g/dL in the epoetin alfa group, p<0.0001.

Subjects in the roxadustat group received lower mean IV iron during weeks 28 to 52 than subjects in the epoetin alfa group (p=0.00091). Roxadustat-treated patients had a greater reduction in hepcidin as compared to ESA-treated patients. Additionally, a lower proportion of subjects on roxadustat received a red blood cell transfusion during treatment than the epoetin alfa group (12.5% and 21.1%, respectively, p=0.0337), with reduction in RBC transfusion risk by 33% compared with epoetin alfa; HR (95% CI) = 0.67 (0.466, 0.970), p=0.0337.

Mean LDL cholesterol levels decreased in the roxadustat group from baseline to the average over weeks 12 to 28 (-13.70 mg/dL) but increased in the epoetin alfa group (1.23 mg/dL) with a treatment difference of -14.67 mg/dL (p<0.0001).

The incidence of treatment emergent adverse events was comparable in the roxadustat and epoetin alfa arms and were generally consistent with those typically expected in study patient population of ESRD on chronic dialysis therapy. The most frequently observed adverse events with roxadustat in this trial were nausea, hypertension, vomiting, and hyperkalemia.

Non-Dialysis CKD Patients (OLYMPUS) - AstraZeneca

OLYMPUS is AstraZeneca's Phase 3, randomized, double-blinded, placebo-controlled trial designed to evaluate the efficacy and safety of roxadustat vs. placebo for the treatment of patients with anemia in CKD stages 3, 4 or 5 whose disease progression is moderate to severe and who are non-dialysis dependent. The trial in 2,781 patients met its primary efficacy endpoint by demonstrating a statistically-significant improvement in mean change from baseline in hemoglobin levels averaged over weeks 28 to 52 (1.75 g/dL) as compared with Placebo (0.40 g/dL).

Roxadustat also improved hemoglobin levels from baseline in a subgroup of patients with inflammation (CRP>5 mg/L), with a statistically significant mean increase of 1.73 g/dL, compared to 0.62g/dL with placebo.

Overall safety findings are generally consistent with the non-dialysis patient population. For all patients, the most frequently reported adverse events in the intent to treat analysis set were end-stage renal disease, pneumonia, urinary tract infection and hypertension.

Table of Contents

o Non-Dialysis CKD Patients (ALPS) - Astellas

ALPS is Astellas' Phase 3, randomized, double-blind, placebo-controlled study of the efficacy and safety of roxadustat for the treatment of anemia in CKD in 597 patients not on dialysis. The trial met its primary endpoints by demonstrating superiority in efficacy vs. placebo in terms of hemoglobin change from baseline at weeks 28 to 52 (1.988 for roxadustat vs 0.406 for placebo, p<0.001).

Roxadustat was superior to placebo in its ability to lower LDL from baseline with an LS mean difference of -0.701 mmol/L (95% CI: -0.83, -0.57). Roxadustat was superior to placebo in delaying the need for rescue therapy (HR (95%CI) = 0.238 (0.17, 0.33), p<0.001).

The safety profile observed in this study was in line with the expected event profile in non-dialysis patients. Common adverse events in both treatment groups were end-stage renal disease, hypertension, peripheral edema, and decreased glomerular filtration rate.

Stable Dialysis CKD Patients (ROCKIES) - AstraZeneca

ROCKIES is AstraZeneca's Phase 3, randomized, open-label, active-controlled trial designed to assess the efficacy and safety of roxadustat vs. epoetin alfa, for the treatment of anemia in patients with CKD who are dialysis dependent. The trial in 2,133 patients met its primary efficacy endpoint by demonstrating a statistically-significant improvement in mean change from baseline in hemoglobin levels averaged over weeks 28 to 52 (0.77 g/dL) compared with epoetin alfa (0.68 g/dL).

Roxadustat also improved hemoglobin levels from baseline in a subgroup of patients with inflammation (CRP>5 mg/L, demonstrating a statistically significant improvement with a mean increase of 0.80 g/dL compared to 0.59 g/dL with epoetin alfa. Patients treated with roxadustat used less monthly IV iron (mean = 59mg) compared to those treated with epoetin alfa (mean = 91mg) from week 36 to the end of the study.

Adverse events with roxadustat were generally similar to those seen in patients treated with epoetin alfa and commonly found in dialysis patients. In roxadustat treated patients, the most frequently reported adverse events were diarrhoea, hypertension, pneumonia, headache and arteriovenous fistula thrombosis.

o Stable Dialysis CKD Patients (PYRENEES) - Astellas

PYRENEES is Astellas' Phase 3, randomized, active-controlled trial designed to assess the efficacy and safety of roxadustat vs. epoetin alfa or darbepoetin alfa, for the treatment of anemia in 838 patients with CKD who are dialysis dependent. The trial met its primary efficacy endpoint: roxadustat was considered non-inferior to ESAs based on the mean change from baseline in average hemoglobin levels at weeks 28 to 52 (0.397 vs 0.183; non-inferiority margin = -0.75).

Roxadustat was superior to ESAs in its ability to lower LDL from baseline with an LS mean difference of -0.377 mmol/L (95% CI: -0.451, -0.305). Roxadustat was superior to ESAs in reducing the need for monthly IV iron use (LS mean difference (95%CI) = -31.9 mg (-41.4, -22.4), p<0.001).

The safety profile observed in this study was in line with the expected event profile in dialysis patients. There was a greater proportion of deaths in the roxadustat treatment group compared with the ESA group; however, the study was not powered to assess risk of MACE events or death, as compared to the pooled analysis above. Common adverse events in both treatment groups were hypertension, arteriovenous fistula thrombosis, headache, and diarrhea.

Roxadustat for the Treatment of Anemia in Myelodysplastic Syndromes

In addition to anemia in CKD, we are continuing to enroll the 156-patient double-blind, placebo-controlled portion of our global Phase 3 clinical study of roxadustat in transfusion-dependent, lower risk MDS patients. The primary endpoint is the proportion of patients who achieve transfusion independence.

In China, the Phase 2/3 clinical trial to evaluate the safety and efficacy of roxadustat in non-transfusion dependent, lower risk MDS patients with anemia is ongoing. The primary endpoint for this study is percentage of patients achieving a hemoglobin response.

Roxadustat for the Treatment of Anemia in Chemotherapy-Induced Anemia

We began a Phase 2 clinical trial of roxadustat in the U.S. in chemotherapy-induced anemia in the third quarter of 2019. This is a Phase 2 single-arm open label study investigating the efficacy and safety of roxadustat for the treatment of anemia in patients receiving chemotherapy treatment for non-myeloid malignancies in the U.S., with treatment duration of 16 weeks, and will enroll up to 100 patients.

Pamrevlumab (FG-3019) - Monoclonal Antibody Against Connective Tissue Growth Factor (CTGF)

Pamrevlumab is our human monoclonal antibody that inhibits the activity of CTGF, a central mediator and critical common element in the progression of fibrotic and fibro-proliferative diseases. We initiated our Phase 3 clinical trials of pamrevlumab for the treatment of IPF and for locally advanced unresectable pancreatic cancer. We recently presented topline results from our 1-year data from our ongoing Phase 2 trial for DMD.

In the U.S., the FDA has granted Orphan Drug Designation to pamrevlumab for the treatment of IPF, locally advanced unresectable pancreatic cancer, and DMD. Pamrevlumab has also received Fast Track designation from the FDA for the treatment of both IPF and locally advanced unresectable pancreatic cancer.

Idiopathic Pulmonary Fibrosis

We recently began enrolling ZEPHYRUS and continue to enroll patients in this double-blind, placebo-controlled Phase 3 trial of pamrevlumab in approximately 565 IPF patients.

• Locally Advanced Unresectable Pancreatic Cancer

We recently began enrolling LAPIS, our double-blind placebo controlled Phase 3 trial of pamrevlumab as a neoadjuvant therapy for locally advanced unresectable pancreatic cancer. We intend to enroll approximately 260 patients, randomized 1:1 to receive either pamrevlumab in combination with gemcitabine and nab-paclitaxel, or placebo with gemcitabine and nab-paclitaxel.

Duchenne Muscular Dystrophy

In DMD, all 21 non-ambulatory patients from our fully enrolled Phase 2 open-label single-arm trial have completed over one year of treatment with pamrevlumab. Based on our administrative analysis and advice we received from expert advisors, we are planning to share these results with the FDA in the fourth quarter of this year to discuss our clinical development plan for DMD.

Collaboration Partnerships for Roxadustat

Our current and future research, development, manufacturing and commercialization efforts with respect to roxadustat and our other product candidates currently in development depend on funds from our collaboration agreements with Astellas and AstraZeneca as described below.

Astellas

In June 2005, we entered into a collaboration agreement with Astellas for the development and commercialization (but not manufacture) of roxadustat for the treatment of anemia in Japan ("Japan Agreement"). In April 2006, we entered into the Europe Agreement with Astellas for roxadustat for the treatment of anemia in Europe, the Commonwealth of Independent States, the Middle East, and South Africa. Under these agreements, we provide Astellas the right to develop and commercialize roxadustat for anemia indications in these territories.

We share responsibility with Astellas for clinical development activities required for the U.S. and the EU regulatory approval of roxadustat and share equally those development costs under the agreed development plan for such activities. Astellas will be responsible for clinical development activities and all associated costs required for regulatory approval in all other countries in the Astellas territories. Astellas will own and have responsibility for regulatory filings in its territories. We are responsible, either directly or through our contract manufacturers, for the manufacture and supply of all quantities of roxadustat to be used in development and commercialization under the agreements.

Table of Contents

The Astellas agreements will continue in effect until terminated. Either party may terminate the agreements for certain material breaches by the other party. In addition, Astellas will have the right to terminate the agreements for certain specified technical product failures, upon generic sales reaching a particular threshold, upon certain regulatory actions, or upon our entering into a settlement admitting the invalidity or unenforceability of our licensed patents. Astellas may also terminate the agreements for convenience upon advance written notice to us. In the event of any termination of the agreements, Astellas will transfer and assign to us the regulatory filings for roxadustat and will assign or license to us the relevant trademarks used with the products in the Astellas territories. Under certain terminations, Astellas is also obligated to pay us a termination fee.

Consideration under these agreements includes a total of \$360.1 million in upfront and non-contingent payments, and milestone payments totaling \$557.5 million, of which \$542.5 million are development and regulatory milestones and \$15.0 million are commercial-based milestones. Total consideration, excluding development cost reimbursement and product sales-related payments, could reach \$917.6 million. The aggregate amount of such consideration received through September 30, 2019 totals \$487.6 million. Additionally, under these agreements, Astellas pays 100% of the commercialization costs in its territories. Astellas will pay us a transfer price, based on net sales, in the low 20% range for our manufacture and delivery of roxadustat.

In September 2019, Japan's Ministry of Health, Labour and Welfare approved roxadustat for the treatment of anemia associated with dialysis CKD patients. Accordingly, the consideration of \$12.5 million associated with this milestone was included in the transaction price and allocated to performance obligations under the Japan Agreement in the third quarter of 2019. This milestone payment was received in October 2019.

During the second quarter of 2019, we received positive topline results from analyses of pooled major adverse cardiac event ("MACE") and MACE+ data from its Phase 3 trials evaluating roxadustat as a treatment for dialysis and non-dialysis CKD patients, enabling Astellas to prepare for an MAA submission to the EMA during their fiscal year 2019, which ends on March 31, 2020, following our planned NDA submission to the FDA in 2019. We evaluated the two regulatory milestone payments associated with the planned MAA submission and concluded that these milestones became probable of being achieved in the second quarter of 2019. Accordingly, the total consideration of \$130.0 million associated with these milestones was included in the transaction price and allocated to performance obligations under the Europe Agreement in the second quarter of 2019

In addition, as of September 30, 2019, Astellas had separate investments of \$80.5 million in the equity of FibroGen, Inc.

AstraZeneca

In July 2013, we entered into the U.S./RoW Agreement, a collaboration agreement with AstraZeneca for roxadustat for the treatment of anemia in the U.S. and all territories not previously licensed to Astellas, except China. In July 2013, through our China subsidiary and related affiliates, we entered into the China Agreement, a collaboration agreement with AstraZeneca for roxadustat for the treatment of anemia in China. Under these agreements we provide AstraZeneca the right to develop and commercialize roxadustat for anemia in these territories. We share responsibility with AstraZeneca for clinical development activities required for U.S. regulatory approval of roxadustat.

In 2015, we reached the \$116.5 million cap on our initial funding obligations (during which time we shared 50% of the joint initial development costs), therefore all development and commercialization costs for roxadustat for the treatment of anemia in CKD in the U.S., Europe, Japan and all other markets outside of China have been paid by Astellas and AstraZeneca since reaching the cap.

In China, FibroGen (China) Medical Technology Development Co., Ltd. ("FibroGen Beijing") will conduct the development work for CKD anemia, will hold all of the regulatory licenses issued by China regulatory authorities, and will be primarily responsible for regulatory, clinical and manufacturing. China development costs are shared 50/50. AstraZeneca is also responsible for 100% of development expenses in all other licensed territories outside of China. Outside of China, we are responsible, through our contract manufacturers, for the manufacture and supply of all quantities of roxadustat to be used in development and commercialization under the AstraZeneca agreements.

Under the AstraZeneca agreements, we will receive upfront and subsequent non-contingent payments totaling \$402.2 million. Potential milestone payments under the agreements total \$1.2 billion, of which \$571.0 million are development and regulatory milestones and \$652.5 million are commercial-based milestones. Total consideration under the agreements, excluding development cost reimbursement, transfer price payments, royalties and profit share, could reach \$1.6 billion. The aggregate amount of such consideration received through September 30, 2019 totals \$444.2 million.

Under the U.S./RoW Agreement, AstraZeneca will pay for all commercialization costs in the U.S. and RoW and AstraZeneca will be responsible for the U.S. commercialization of roxadustat, with FibroGen undertaking specified promotional activities in the end-stage renal disease segment in the U.S. In addition, we will receive a transfer price for delivery of commercial product based on a percentage of net sales in the low- to mid-single digit range and AstraZeneca will pay us a tiered royalty on net sales of roxadustat in the low 20% range.

Under the China Agreement, which is conducted through FibroGen China Anemia Holdings, Ltd. ("FibroGen China"), the commercial collaboration is structured as a 50/50 profit share. AstraZeneca will conduct commercialization activities in China and fund roxadustat launch costs in China until FibroGen Beijing has achieved profitability. At that time, AstraZeneca will recoup 50% of their historical launch costs out of initial roxadustat profits in China.

Payments under these agreements include over \$500.0 million in upfront, non-contingent and other payments received or expected to be received prior to the first U.S. approval, excluding development expense reimbursement.

AstraZeneca may terminate the U.S./RoW Agreement upon specified events, including our bankruptcy or insolvency, our uncured material breach, technical product failure, or upon 180 days prior written notice at will. If AstraZeneca terminates the U.S./RoW Agreement at will, in addition to any unpaid non-contingent payments, it will be responsible for paying for a substantial portion of the post-termination development costs under the agreed development plan until regulatory approval.

AstraZeneca may terminate the China Agreement upon specified events, including our bankruptcy or insolvency, our uncured material breach, technical product failure, or upon advance prior written notice at will. If AstraZeneca terminates our China Agreement at will, it will be responsible for paying for transition costs as well as make a specified payment to FibroGen China.

In the event of any termination of the agreements, but subject to modification upon termination for technical product failure, AstraZeneca will transfer and assign to us any regulatory filings and approvals for roxadustat in the affected territories that they may hold under our agreements, grant us licenses and conduct certain transition activities.

As mentioned above, during the second quarter of 2019, we received positive topline results from analyses of pooled MACE and MACE+ data from its Phase 3 trials for roxadustat, enabling our NDA submission to the FDA, which is anticipated in 2019. We evaluated the regulatory milestone payment associated with this planned NDA submission and concluded that this milestone became probable of being achieved in the second quarter of 2019. Accordingly, the consideration of \$50.0 million associated with this milestone was included in the transaction price and allocated to performance obligations under the U.S./ RoW Agreement in the second quarter of 2019.

Additional Information Related to Collaboration Agreements

Total cash consideration received through September 30, 2019 and potential cash consideration, other than development cost reimbursement, transfer price payments, royalties and profit share, pursuant to our existing collaboration agreements are as follows:

	Cash Received Through September 30,2019		Additional Potential ash Payments in thousands)	Total Potential Cash Payments		
Astellasrelated-party:						
Japan Agreement	\$	77,593	\$ 95,000	\$	172,593	
Europe Agreement		410,000	 335,000		745,000	
Total Astellas		487,593	430,000		917,593	
AstraZeneca:						
U.S. / RoW Agreement		389,000	860,000		1,249,000	
China Agreement		55,200	 321,500		376,700	
Total AstraZeneca		444,200	1,181,500		1,625,700	
Total revenue	\$	931,793	\$ 1,611,500	\$	2,543,293	

These collaboration agreements also provide for reimbursement of certain fully burdened research and development costs as well as direct out of pocket expenses.

PART II-OTHER INFORMATION

ITEM 1, LEGAL PROCEEDINGS

We are not currently a party to any material legal proceedings.

ITEM 1A. RISK FACTORS

Investing in our common stock involves a high degree of risk. You should carefully consider the risks described below in addition to the other information included or incorporated by reference in this Quarterly Report on Form 10-Q, including our condensed consolidated financial statements and the related notes and "Management's Discussion and Analysis of Financial Condition and Results of Operations," before deciding whether to invest in our common stock. The occurrence of any of the events or developments described below could harm our business, financial condition, results of operations and growth prospects. In such an event, the market price of our common stock could decline, and you may lose all or part of your investment. Although we have discussed all known material risks, the risks described below are not the only ones that we may face. Additional risks and uncertainties not presently known to us or that we currently deem immaterial may also impair our business operations.

We have marked with an asterisk (*) those risks described below that reflect substantive changes from the risks described under Part I, Item 1A "Risk Factors" included in our Annual Report on Form 10-K for the year ended December 31, 2018.

Risks Related to Our Financial Condition and History of Operating Losses

We have incurred significant losses since our inception and anticipate that we will continue to incur losses for the foreseeable future and may never achieve or sustain profitability. We may require additional financings in order to fund our operations.*

We are a clinical-stage biopharmaceutical company with two lead product candidates in clinical development, roxadustat in anemia in chronic kidney disease ("CKD") and myelodysplastic syndromes ("MDS"), and pamrevlumab (FG-3019) in idiopathic pulmonary fibrosis ("IPF"), pancreatic cancer and Duchenne muscular dystrophy ("DMD"). Pharmaceutical product development is a highly risky undertaking. To date, we have focused our efforts and most of our resources on hypoxia-inducible factor ("HIF") and fibrosis biology research, as well as developing our lead product candidates. We are not profitable and, other than in 2006 and 2007 due to income received from our Astellas Pharma Inc. ("Astellas") collaboration, have incurred annual losses each year since our inception. We have not generated any revenue based on commercial drug product sales to date. We continue to incur significant research and development and other expenses related to our ongoing operations. Our net loss for the year ended December 31, 2018 was approximately \$86.4 million, and our net loss for the years ended December 31, 2017, and 2016, recast from amounts previously reported due to the adoption of the new revenue standards, were approximately \$120.9 million and \$58.1 million, respectively. As of September 30, 2019, we had an accumulated deficit of \$686.6 million. As of September 30, 2019, we had capital resources consisting of cash, cash equivalents and short-term investments of \$628.6 million plus \$11.0 million of long-term investments classified as available for sale securities. Despite contractual development and cost coverage commitments from our collaboration partners, AstraZeneca AB ("AstraZeneca") and Astellas, and the potential to receive milestone and other payments from these partners, and despite commercialization efforts in China and Japan for roxadustat for the treatment of anemia caused by CKD, we anticipate we will continue to incur losses on an annual basis for the foreseeable future, and we anticipate these losses will increase as we continue our development of and seek regulatory approval for our product candidates and in our commercialization efforts. If we do not successfully develop and continue to obtain regulatory approval for our existing or any future product candidates and effectively manufacture, market and sell any product candidates that are approved, we may never generate product sales, and even if we do generate product sales, we may never achieve or sustain profitability on a quarterly or annual basis. Our prior losses, combined with expected future losses, have had and will continue to have an adverse effect on our stockholders' equity and working capital. Our failure to become and remain profitable would depress the market price of our common stock and could impair our ability to raise capital, expand our business, diversify our product offerings or continue our operations.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 161 of 1730

Table of Contents

We believe that we will continue to expend substantial resources for the foreseeable future as we continue late-stage clinical development of roxadustat, grow our operations in the People's Republic of China ("China"), expand our clinical development efforts on pamrevlumab, seek regulatory approval, prepare for the commercialization of our product candidates, and pursue additional indications. These expenditures will include costs associated with research and development, conducting preclinical trials and clinical trials, obtaining regulatory approvals in various jurisdictions, and manufacturing and supplying products and product candidates for ourselves and our partners. In particular, in our planned Phase 3 clinical trial program for roxadustat, which we believe will be the largest Phase 3 program ever conducted for an anemia product candidate, we are expecting to enroll more than 8,000 patients for our United States ("U.S.") and European programs alone. We are conducting this Phase 3 program in conjunction with Astellas and AstraZeneca, and we are substantially dependent on Astellas and AstraZeneca for the funding of this large program. The outcome of any clinical trial and/or regulatory approval process is highly uncertain and we are unable to fully estimate the actual costs necessary to successfully complete the development and regulatory approval process for our compounds in development and any future product candidates. We believe that the net proceeds from our 2017 public offerings, our existing cash and cash equivalents, short-term and longterm investments and accounts receivable, and expected third-party collaboration revenues will allow us to fund our operating plans through at least the next 12 months. Our operating plans or third-party collaborations may change as a result of many factors, which are discussed in more detail below, and other factors that may not currently be known to us, and we therefore may need to seek additional funds sooner than planned, through offerings of public or private securities, debt financings or other sources, such as royalty monetization or other structured financings. Such financings may result in dilution to stockholders, imposition of debt covenants and repayment obligations, or other restrictions that may adversely affect our business. We may also seek additional capital due to favorable market conditions or strategic considerations even if we currently believe that we have sufficient funds for our current or future operating plans.

Our future funding requirements will depend on many factors, including, but not limited to:

- the rate of progress in the development of our product candidates;
- the costs of development efforts for our product candidates, such as pamrevlumab, that are not subject to reimbursement from our collaboration partners;
- the costs necessary to obtain regulatory approvals, if any, for our product candidates in the U.S., China and other jurisdictions, and
 the costs of post-marketing studies that could be required by regulatory authorities in jurisdictions where approval is obtained;
- the continuation of our existing collaborations and entry into new collaborations;
- the time and unreimbursed costs necessary to commercialize products in territories in which our product candidates are approved for sale:
- the revenues from any future sales of our products as well as revenue earned from profit share, royalties and milestones;
- the level of reimbursement or third-party payor pricing available to our products;
- the costs of establishing and maintaining manufacturing operations and obtaining third-party commercial supplies of our products, if any, manufactured in accordance with regulatory requirements;
- · the costs we incur in maintaining domestic and foreign operations, including operations in China;
- regulatory compliance costs;
- · the costs of our commercialization efforts for roxadustat for the treatment of anemia caused by CKD in China and Japan; and
- the costs we incur in the filing, prosecution, maintenance and defense of our extensive patent portfolio and other intellectual property rights.

Additional funds may not be available when we require them, or on terms that are acceptable to us. If adequate funds are not available to us on a timely basis, we may be required to delay, limit, reduce or terminate our research and development efforts or other operations or activities that may be necessary to commercialize our product candidates.

Table of Contents

All of our recent revenue has been earned from collaboration partners for our product candidates under development.*

Substantially all of our revenues recognized in recent years have been from our collaboration partners.

We will require substantial additional capital to achieve our development and commercialization goals, which for our lead product, roxadustat, is currently contemplated to be provided under our existing third-party collaborations with Astellas and AstraZeneca.

If either or both of these collaborations were to be terminated, we could require significant additional capital in order to proceed with development and commercialization of our product candidates, including with respect to our expected commercialization for roxadustat for the treatment of anemia caused by CKD in China and Japan, or we may require additional partnering in order to help fund such development and commercialization. If adequate funds or partners are not available to us on a timely basis or on favorable terms, we may be required to delay, limit, reduce or terminate our research and development efforts or other operations.

If we are unable to continue to progress our development efforts and achieve milestones under our collaboration agreements, our revenues may decrease and our activities may fail to lead to commercial products.

Substantially all of our revenues to date have been, and a significant portion of our future revenues are expected to be, derived from our existing collaboration agreements. Revenues from research and development collaborations depend upon continuation of the collaborations, reimbursement of development costs, the achievement of milestones and royalties and profits from our product sales, if any, derived from future products developed from our research. If we are unable to successfully advance the development of our product candidates or achieve milestones, revenues under our collaboration agreements will be substantially less than expected.

Risks Related to the Development and Commercialization of Our Product Candidates

We are substantially dependent on the success of our lead product, roxadustat, and our second compound in development, pamrevlumab.*

To date, we have invested a substantial portion of our efforts and financial resources in the research and development of roxadustat and pamrevlumab. While we have received approval of our New Drug Applications ("NDA") for roxadustat in China for CKD anemia for patients on dialysis and not on dialysis, and for roxadustat in Japan for CKD anemia in dialysis patients, we will need to make substantial additional investments in both the development and commercialization of roxadustat worldwide and in various indications. Our near-term prospects, including maintaining our existing collaborations with Astellas and AstraZeneca, will depend heavily on successful development and commercialization of roxadustat, including obtaining regulatory approvals for the commercialization of roxadustat for anemia associated with CKD in the U.S., Europe, and Japan for non-dialysis patients.

Our other lead product candidate, pamrevlumab, is currently in clinical development for IPF, pancreatic cancer and DMD. Pamrevlumab requires substantial further development and investment. We do not have a collaboration partner for support of this compound, and, while we have promising open-label safety data and potential signals of efficacy, we would need to complete larger and more extensive controlled clinical trials to validate the results to date in order to continue further development of this product candidate. In addition, although there are many potentially promising indications beyond IPF, pancreatic cancer and DMD, we are still exploring indications for which further development of, and investment for, pamrevlumab may be appropriate. Accordingly, the costs and time to complete development and related risks are currently unknown. Moreover, pamrevlumab is a monoclonal antibody, which may require experience and expertise that we may not currently possess as well as financial resources that are potentially greater than those required for our small molecule lead compound, roxadustat.

The clinical and commercial success of roxadustat and pamrevlumab will depend on a number of factors, many of which are beyond our control, and we may be unable to complete the development or commercialization of roxadustat or pamrevlumab.*

The clinical and commercial success of roxadustat and pamrevlumab will depend on a number of factors, including the following:

- the timely completion of data analyses from our Phase 3 clinical trials for roxadustat, which will depend substantially upon requirements for such trials imposed by the U.S. Food and Drug Administration ("FDA") and other regulatory agencies and bodies and the continued commitment and coordinated and timely performance by our third-party collaboration partners, AstraZeneca and Astellas;
- the timely initiation and completion of our clinical trials for pamrevlumab, including in IPF, pancreatic cancer and DMD;
- our ability to demonstrate the safety and efficacy of our product candidates to the satisfaction of the relevant regulatory authorities;

- the ultimate approval criteria (which may include non-inferiority margins and statistical analyses methods), indications, patient populations, and ultimate benefit-risk analysis used by regulatory authorities in their approval processes;
- whether we are required by the FDA or other regulatory authorities to conduct additional clinical trials, and the scope and nature of such clinical trials, prior to approval to market our products;
- the timely receipt of necessary marketing approvals from the FDA and foreign regulatory authorities, including pricing and reimbursement determinations:
- the ability to successfully commercialize our product candidates, if approved, for marketing and sale by the FDA or foreign regulatory authorities, whether alone or in collaboration with others;
- our ability and the ability of our third-party manufacturing partners to manufacture quantities of our product candidates at quality levels necessary to meet regulatory requirements and at a scale sufficient to meet anticipated demand at a cost that allows us to achieve profitability;
- our success in educating health care providers and patients about the benefits, risks, administration and use of our product candidates, if approved:
- · acceptance of our product candidates, if approved, as safe and effective by patients and the healthcare community;
- the success of efforts to enter into relationships with large dialysis organizations involving the administration of roxadustat to dialysis
 patients;
- the achievement and maintenance of compliance with all regulatory requirements applicable to our product candidates;
- the maintenance of an acceptable safety profile of our products following any approval;
- the availability, perceived advantages, relative cost, relative safety, and relative efficacy of alternative and competitive treatments;
- our ability to obtain and sustain an adequate level of pricing or reimbursement for our products by third-party payors;
- our ability to enforce successfully our intellectual property rights for our product candidates and against the products of potential competitors; and
- our ability to avoid or succeed in third-party patent interference or patent infringement claims.

Many of these factors are beyond our control. Accordingly, we cannot assure you that we will ever be able to achieve profitability through the sale of, or royalties from, our product candidates. If we or our collaboration partners are not successful in obtaining approval for and commercializing our product candidates, or are delayed in completing those efforts, our business and operations would be adversely affected.

If our commercialization efforts for roxadustat in China are unsuccessful, our business, financial condition and results of operations will be materially harmed.*

We have invested and continue to invest a significant portion of our efforts and financial resources in the development, approval and now commercialization of roxadustat for the treatment of anemia caused by CKD in in China, as well as in other indications and other geographic regions. With the marketing authorization received from the National Medical Products Administration ("NMPA") for roxadustat for the treatment of anemia caused by CKD in patients on dialysis and not on dialysis in China, we plan to launch commercialization efforts in China in the third quarter of 2019 with our commercialization partner AstraZeneca.

Our success of commercialization of roxadustat in China will depend on numerous factors in China, including:

- · our success in the marketing, sales, and distribution of the product along with our collaboration partner AstraZeneca;
- our success in negotiating a cost-effective reimbursed price with the government in China;
- acceptance of roxadustat by state-owned and state-controlled hospitals, physicians, patients and the healthcare community;
- acceptance of pricing and placement of roxadustat on China's Medical Insurance Catalogs. Refer to "Business Government Regulation - Regulation in China" in our annual report on Form 10-K for the year ended December 31, 2018;
- successfully establishing and maintaining commercial manufacturing with third parties;

Table of Contents

- successfully manufacturing our drug substances and drug products through our subsidiary FibroGen (China) Medical Technology Development Co., Ltd. ("FibroGen Beijing");
- our success in arranging for and passing the inspection of our clinical sites by the NMPA;
- whether AstraZeneca is able to recruit and retain adequate numbers of effective sales and marketing personnel for the sale of roxadustat;
- whether we can compete successfully as a new entrant in the treatment of anemia caused by CKD in dialysis patients and non-dialysis
 patients in China; and
- whether we will maintain sufficient funding to cover the costs and expenses associated with creating and sustaining a capable sales and marketing organization and related commercial infrastructure.

Successful commercialization of roxadustat will require significant resources and time, and there is a risk that we may not successfully commercialize roxadustat. If we do not achieve one or more of these factors in a timely manner or at all, we could experience significant delays or an inability to successfully commercialize roxadustat and generate revenues, which would deprive us from additional working capital and would materially harm our business. If we do not successfully commercialize roxadustat in China, our collaboration partners and third parties may also lose confidence in our ability to execute in commercialization efforts and become less likely to collaborate with us, and our business may be harmed.

As a company, we have no commercialization experience, and the time and resources to develop such experience are significant. If we fail to achieve and sustain commercial success for roxadustat in China, either directly or with AstraZeneca, our business would be harmed.*

Commercializing roxadustat in China with AstraZeneca will require us to establish commercialization systems, including but not limited to, medical affairs, sales, pharmacovigilance, supply-chain, and distribution capabilities to perform our portion of the collaborative efforts. These efforts will require resources and time. In particular, significant resources may be necessary to successfully market, sell and distribute roxadustat to patients with anemia caused by CKD in dialysis patients and non-dialysis patients. If we, along with AstraZeneca, are not successful in setting our marketing, pricing and reimbursement strategy, facilitating adoption by hospitals in China, recruiting sales and marketing personnel or in building a sales and marketing infrastructure, we will have difficulty commercializing roxadustat, which would adversely affect our business and financial condition.

As we evolve from a company primarily involved in research and development to a company potentially involved in commercialization, we may encounter difficulties in managing our growth and expanding our operations successfully.

If we are successful in advancing roxadustat and our other product candidates through the development stage towards commercialization, we will need to expand our organization, including adding marketing and sales capabilities or continuing to contract with third parties to provide these capabilities for us. As our operations expand, we expect that we will also need to manage our existing and additional relationships with various collaborative partners, suppliers and other third parties. Future growth will impose significant added responsibilities on our organization, in particular on management. Our future financial performance and our ability to commercialize roxadustat and our other product candidates and to compete effectively will depend, in part, on our ability to manage any future growth effectively. To that end, we may not be able to manage our growth efforts effectively, and hire, train and integrate additional management, administrative and sales and marketing personnel, and our failure to accomplish any of these activities could prevent us from successfully growing our Company.

Although regulatory approval has been obtained for roxadustat in China and Japan, we may be unable to obtain regulatory approval for our product candidates in other countries, or such approval may be delayed or limited, due to a number of factors, many of which are beyond our control.*

The clinical trials and the manufacturing of our product candidates are and will continue to be, and the marketing of our product candidates will be, subject to extensive and rigorous review and regulation by numerous government authorities in the U.S. and in other countries where we intend to develop and, if approved, market any product candidates. Before obtaining regulatory approval for the commercial sale of any product candidate, we must demonstrate through extensive preclinical trials and clinical trials that the product candidate is safe and effective for use in each indication for which approval is sought. The regulatory review and approval process is expensive and requires substantial resources and time, and in general very few product candidates that enter development receive regulatory approval. In addition, our collaboration partners for roxadustat have final control over development decisions in their respective territories and they may make decisions with respect to development or regulatory authorities that delay or limit the potential approval of roxadustat, or increase the cost of development or commercialization. Accordingly, we may be unable to successfully develop or commercialize roxadustat or pamrevlumab or any of our other product candidates.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 165 of 1730

Table of Contents

Even though regulatory approval has been obtained for roxadustat in China and Japan, we have not obtained regulatory approval for any of our product candidates in other countries and it is possible that roxadustat and pamrevlumab will never receive regulatory approval in other countries. Other regulatory authorities may take actions or impose requirements that delay, limit or deny approval of roxadustat or pamrevlumab for many reasons, including, among others:

- our failure to adequately demonstrate to the satisfaction of regulatory authorities that roxadustat is safe and effective in treating anemia in CKD or that pamrevlumab is safe and effective in treating IPF, pancreatic cancer or DMD;
- our failure to demonstrate that a product candidate's clinical and other benefits outweigh its safety risks;
- the determination by regulatory authorities that additional clinical trials are necessary to demonstrate the safety and efficacy of roxadustat or pamrevlumab, or that ongoing clinical trials need to be modified in design, size, conduct or implementation;
- our product candidates may exhibit an unacceptable safety signal as they advance through clinical trials, in particular controlled Phase 3 trials;
- the clinical research organizations ("CROs") that conduct clinical trials on our behalf may take actions outside of our control that materially adversely impact our clinical trials;
- we or third-party contractors manufacturing our product candidates may not maintain current good manufacturing practices ("cGMP"), successfully pass inspection or meet other applicable manufacturing regulatory requirements;
- · regulatory authorities may not agree with our interpretation of the data from our preclinical trials and clinical trials;
- · collaboration partners may not perform or complete their clinical programs in a timely manner, or at all; or
- principal investigators may determine that one or more serious adverse events ("SAEs"), is related or possibly related to roxadustat,
 and any such determination may adversely affect our ability to obtain regulatory approval, whether or not the determination is correct.

Any of these factors, many of which are beyond our control, could jeopardize our or our collaboration partners' abilities to obtain regulatory approval for and successfully market roxadustat. Because our business and operations in the near-term are almost entirely dependent upon roxadustat, any significant delays or impediments to regulatory approval could have a material adverse effect on our business and prospects.

In China, the NMPA required that FibroGen Beijing conduct three clinical studies as a post-approval commitment: (i) a post-approval safety study in 2,000 patients; (ii) a drug-intensive monitoring study in 1,000 patients; and (iii) a dosing optimization study in approximately 300 patients on dialysis. Furthermore, in the U.S., we also expect to be required to perform additional clinical trials in order to obtain approval or as a condition to maintaining approval due to post-marketing requirements. If the FDA requires a risk evaluation and mitigation strategy ("REMS"), for any of our product candidates if approved, the substantial cost and expense of complying with a REMS or other post-marketing requirements may limit our ability to successfully commercialize our product candidates.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 166 of 1730

Table of Contents

Preclinical, Phase 1 and Phase 2 clinical trial results may not be indicative of the results that may be obtained in larger, controlled Phase 3 clinical trials required for approval.*

Clinical development is expensive and can take many years to complete, and its outcome is inherently uncertain. Failure can occur at any time during the clinical trial process. Success in preclinical and early clinical trials, which are often highly variable and use small sample sizes, may not be predictive of similar results in humans or in larger, controlled clinical trials, and successful results from early or small clinical trials may not be replicated or show as favorable an outcome, even if successful.

We have conducted a limited number of Phase 2 clinical trials with pamrevlumab. We have conducted a randomized placebo-controlled study in 103 IPF patients with sub-studies in an additional 57 IPF patients comparing pamrevlumab to one of two standards of care, an open-label Phase 2 dose escalation study of pamrevlumab for IPF in 89 patients and a randomized double-blind placebo controlled study for liver fibrosis in subjects with hepatitis B, we are currently conducting an open-label randomized, active-control, neoadjuvant Phase 2 trial in pancreatic cancer combining pamrevlumab with nab-paclitaxel plus gemcitabine in 37 patients, and we are currently in a Phase 2 open-label trial of pamrevlumab for DMD in 21 non-ambulatory patients. We cannot be sure that the results we have received to date from these trials will be substantiated in larger, well-controlled Phase 3 clinical trials, that larger trials will demonstrate the safety and efficacy of pamrevlumab for these or other indications, that further studies will provide benefits over existing approved products or that new safety issues will not be uncovered in further trials. In addition, while we believe that the limited animal and human studies conducted to date suggest that pamrevlumab has the potential to arrest or reverse fibrosis and reduce tumor mass in some patients or diseases, we cannot be sure that these results will be indicative of the effects of pamrevlumab in larger human trials. In addition, the IPF and pancreatic cancer patient populations are extremely ill and routinely experience SAEs, including death, which may be attributed to pamrevlumab in a manner that negatively impacts the safety profile of our product candidate. If the additional clinical trials that we are planning or are currently conducting for pamrevlumab do not show favorable efficacy results or result in safety concerns, or if we do not meet our clinical endpoints with statistical significance, or demonstrate an acceptable risk-benefit profile, we may be prevented from or delay

In the past we developed an earlier generation product candidate aimed at treating anemia in CKD that resulted in a clinical hold for a safety signal seen in that product in Phase 2 clinical trials. The clinical hold applied to that product candidate and roxadustat was lifted for both product candidates after submission of the requested information to the FDA. While we have not seen similar safety concerns involving roxadustat to date, some of the safety concerns associated with the treatment of patients with anemia in CKD using erythropoiesis stimulating agents ("ESAs") did not emerge for many years until placebo-controlled studies had been conducted in large numbers of patients. And while the data monitoring committee for our U.S. and Europe Phase 3 anemia trials has consistently determined that our trials should continue without modification to the protocol, safety issues may still be discovered upon review of unblinded major adverse cardiac event ("MACE") or other data. The biochemical pathways that we believe are affected by roxadustat are implicated in a variety of biological processes and disease conditions, and it is possible that the use of roxadustat to treat larger numbers of patients will demonstrate unanticipated adverse effects, including possible drug interactions, which may negatively impact the safety profile, use and market acceptance of roxadustat. We studied the potential interaction between roxadustat and three statins (atorvastatin, rosuvastatin and simvastatin), which are used to lower levels of lipids in the blood. An adverse effect associated with increased statin plasma concentration is myopathy, which typically presents in a form of myalgia. The studies indicated the potential for increased exposure to those statins when roxadustat is taken simultaneously with those statins and suggested the need for statin dose reductions for patients receiving higher statin doses. We performed additional clinical pharmacology studies to evaluate if the effect of any such interaction could be minimized or eliminated by a modification of the dosing schedule that would separate the administration of roxadustat and the statin by up to 10 hours, however, such studies showed no minimization of effect. It is possible that the potential for interaction between roxadustat and statins could lead to label provisions for statins or roxadustat relating, for example, to dose scheduling or recommended statin dose limitations. In CKD patients, statin therapy is often initiated earlier than treatment for anemia, and risks of myopathy have been shown to decrease with increased time on drug. While we believe the prior statin treatment history of such patients at established doses may reduce the risk of adverse effects from any interaction with roxadustat and facilitate any appropriate dose adjustments, we cannot be sure that this will be the case.

Our Phase 3 trials include a MACE safety endpoint, which is a composite endpoint designed to identify major safety concerns, in particular relating to cardiovascular events such as cardiovascular death, myocardial infarction and stroke. The European Medicines Agency ("EMA") is requiring MACE+ as a safety endpoint which, in addition to the MACE components, incorporates measurements of hospitalization rates due to heart failure or unstable angina. The EMA will also review MACE results. The FDA has also informed us that the MACE endpoint will need to be evaluated separately for our Phase 3 trials in non-dialysis-dependent ("NDD")-CKD patients and our Phase 3 trials in dialysis-dependent ("DD")-CKD patients. The MACE endpoint is being evaluated in pooled analysis across Phase 3 studies of similar study populations and requires demonstration of non-inferiority relative to comparator, which means that the MACE event rate in roxadustat-treated patients must have less than a specified probability of exceeding the rate in the comparator trial by a specified hazard ratio.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 167 of 1730

Table of Contents

The number of patients necessary in order to permit a statistical analysis with adequate ability to detect the relative risk of MACE or MACE+ events in different arms of the trial, referred to as statistical power, depends on a number of factors, including the rate at which MACE or MACE+ events occur per patient-year in the trial, treatment duration of the patients, the achieved hazard ratios, the rates of discontinuation, and the required statistical power and confidence intervals.

In addition, we cannot be sure that the potential advantages we believe roxadustat may have for treatment of patients with anemia in CKD, as compared to the use of ESAs, will be substantiated by our larger U.S. and European Phase 3 clinical trials, or that we will be able to include a discussion of such advantages in our labeling should we obtain approval. We believe that roxadustat may have certain benefits as compared to ESAs based on the data from our Phase 2 clinical trials and China Phase 3 trials conducted to date, including safety benefits, the absence of a hypertensive effect, the potential to lower cholesterol levels and the potential to correct anemia without the use of IV iron. However, our belief that roxadustat may offer those benefits is based on a limited amount of data from our clinical trials to date, and our understanding of the likely mechanisms of action for roxadustat. Some of these benefits, such as those associated with the apparent effects on blood pressure and cholesterol, are not fully understood and, even if roxadustat receives marketing approval in additional countries beyond China and Japan, we do not expect that it will be approved for the treatment of high blood pressure or high cholesterol based on the data from our Phase 3 trials, and we may not be able to refer to any such benefits in the labeling. While the data from our Phase 2 trials suggests roxadustat may reduce low-density lipoprotein ("LDL"), and reduce the ratio of LDL to high-density lipoprotein ("HDL"), the data show it may also reduce HDL, which may be a risk to patients. In addition, causes of the safety concerns associated with the use of ESAs to achieve specified target hemoglobin levels have not been fully elucidated. While we believe that the issues giving rise to these concerns with ESAs are likely due to factors other than the hemoglobin levels achieved, we cannot be certain that roxadustat will not be associated with similar, or more severe, safety concerns.

Many companies in the pharmaceutical and biotechnology industries have suffered significant setbacks in late-stage clinical trials after achieving positive results in early-stage development, and we may face similar setbacks. In addition, the CKD patient population has many afflictions that may cause severe illness or death, which may be attributed to roxadustat in a manner that negatively impacts the safety profile of our product candidate. The results of our completed Phase 3 clinical trials for roxadustat demonstrated efficacy, as all primary efficacy endpoints were met with statistical significance. While we have reported topline cardiovascular safety results, the analysis of these data is ongoing; there may be unanticipated safety concerns or adverse events that prevent from or delay obtaining marketing approval for roxadustat in additional countries beyond China and Japan, and even if we obtain marketing approval, any sales of roxadustat may suffer.

We do not know whether our ongoing or planned clinical trials of roxadustat or pamrevlumab will need to be redesigned based on interim results, be able to achieve sufficient enrollment or be completed on schedule, if at all.*

Clinical trials can be delayed or terminated for a variety of reasons, including delay or failure to:

- address any physician or patient safety concerns that arise during the course of the trial;
- obtain required regulatory or institutional review board ("IRB") approval or guidance;
- reach timely agreement on acceptable terms with prospective CROs and clinical trial sites;
- recruit, enroll and retain patients through the completion of the trial;
- maintain clinical sites in compliance with clinical trial protocols;
- initiate or add a sufficient number of clinical trial sites; and
- manufacture sufficient quantities of product candidate for use in clinical trials.

In addition, we could encounter delays if a clinical trial is suspended or terminated by us, by the relevant IRBs at the sites at which such trials are being conducted, or by the FDA or other regulatory authorities. A suspension or termination of clinical trials may result from any number of factors, including failure to conduct the clinical trial in accordance with regulatory requirements or our clinical protocols, inspection of the clinical trial operations or trial site by the FDA or other regulatory authorities resulting in the imposition of a clinical hold, unforeseen safety issues or adverse side effects, changes in laws or regulations, or a principal investigator's determination that a serious adverse event could be related to our product candidates. Any delays in completing our clinical trials will increase the costs of the trial, delay the product candidate development and approval process and jeopardize our ability to commence marketing and generate revenues. Any of these occurrences may materially and adversely harm our business and operations and prospects.

Our product candidates may cause or have attributed to them undesirable side effects or have other properties that delay or prevent their regulatory approval or limit their commercial potential.

Undesirable side effects caused by our product candidates or that may be identified as related to our product candidates by physician investigators conducting our clinical trials or even competing products in development that utilize a similar mechanism of action or act through a similar biological disease pathway could cause us or regulatory authorities to interrupt, delay or halt clinical trials and could result in the delay or denial of regulatory approval by the FDA or other regulatory authorities and potential product liability claims. Adverse events and SAEs that emerge during treatment with our product candidates or other compounds acting through similar biological pathways may be deemed to be related to our product candidate and may result in:

- our Phase 3 clinical trial development plan becoming longer and more extensive;
- regulatory authorities increasing the data and information required to approve our product candidates and imposing other requirements; and
- our collaboration partners terminating our existing agreements.

The occurrence of any or all of these events may cause the development of our product candidates to be delayed or terminated, which could materially and adversely affect our business and prospects. Refer to "Business - Our Development Program for Roxadustat" and "Business - Pamrevlumab for the Treatment of Fibrosis and Cancer" for a discussion of the adverse events and SAEs that have emerged in clinical trials of roxadustat and pamrevlumab.

Clinical trials of our product candidates may not uncover all possible adverse effects that patients may experience.

Clinical trials are conducted in representative samples of the potential patient population, which may have significant variability. Clinical trials are by design based on a limited number of subjects and of limited duration for exposure to the product used to determine whether, on a potentially statistically significant basis, the planned safety and efficacy of any product candidate can be achieved. As with the results of any statistical sampling, we cannot be sure that all side effects of our product candidates may be uncovered, and it may be the case that only with a significantly larger number of patients exposed to the product candidate for a longer duration, that a more complete safety profile is identified. Further, even larger clinical trials may not identify rare serious adverse effects or the duration of such studies may not be sufficient to identify when those events may occur. There have been other products, including ESAs, for which safety concerns have been uncovered following approval by regulatory authorities. Such safety concerns have led to labeling changes or withdrawal of ESAs products from the market. While our most advanced product candidate is chemically unique from ESAs, it or any of our product candidates may be subject to similar risks. For example, roxadustat for use in anemia in CKD is being developed to address a very diverse patient population expected to have many serious health conditions at the time of administration of roxadustat, including diabetes, high blood pressure and declining kidney function.

To date we have not seen evidence of significant safety concerns with our product candidates currently in clinical trials. Patients treated with our products, if approved, may experience adverse reactions and it is possible that the FDA or other regulatory authorities may ask for additional safety data as a condition of, or in connection with, our efforts to obtain approval of our product candidates. If safety problems occur or are identified after our product candidates reach the market, we may, or regulatory authorities may require us to amend the labeling of our products, recall our products or even withdraw approval for our products.

We may fail to enroll a sufficient number of patients in our clinical trials in a timely manner, which could delay or prevent clinical trials of our product candidates.

Identifying and qualifying patients to participate in clinical trials of our product candidates is critical to our success. The timing of our clinical trials depends on the rate at which we can recruit and enroll patients in testing our product candidates. Patients may be unwilling to participate in clinical trials of our product candidates for a variety of reasons, some of which may be beyond our control:

- severity of the disease under investigation;
- availability of alternative treatments;
- size and nature of the patient population;
- eligibility criteria for and design of the study in question;
- perceived risks and benefits of the product candidate under study;
- ongoing clinical trials of competitive agents;

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 169 of 1730

Table of Contents

- physicians' and patients' perceptions of the potential advantages of our product candidates being studied in relation to available therapies or other products under development;
- our CRO's and our trial sites' efforts to facilitate timely enrollment in clinical trials;
- patient referral practices of physicians; and
- ability to monitor patients and collect patient data adequately during and after treatment.

Patients may be unwilling to participate in our clinical trials for roxadustat due to adverse events observed in other drug treatments of anemia, and patients currently controlling their disease with existing ESAs may be reluctant to participate in a clinical trial with an investigational drug. We may not be able to successfully initiate or continue clinical trials if we cannot rapidly enroll a sufficient number of eligible patients to participate in the clinical trials required by regulatory agencies. If we have difficulty enrolling a sufficient number of patients to conduct our clinical trials as planned, we may need to delay, limit or terminate on-going or planned clinical trials, any of which could have a material and adverse effect on our business and prospects.

If we or third-party manufacturers and other service providers on which we rely cannot manufacture sufficient quantities of our product candidates, or at sufficient quality, or perform other services we require, we may experience delays in development, regulatory approval, launch or commercialization.

Completion of our clinical trials and commercialization of our product candidates require access to, or development of, facilities to manufacture and manage our product candidates at sufficient yields and at commercial scale. Although we have entered into commercial supply agreements for the manufacture of some of our raw materials, we have not yet entered into commercial supply agreements with all of our third-party manufacturers. We are continuing to negotiate and expect to enter into commercial supply agreements and other supply management agreements with third-party manufacturers, but we may not be able to enter into these agreements with satisfactory terms or on a timely manner.

We have limited experience manufacturing or managing third parties in manufacturing any of our product candidates in the volumes that are expected to be necessary to support large-scale clinical trials and sales. In addition, we have limited experience forecasting supply requirements or coordinating supply chain (including export management) for launch or commercialization, which is a complex process involving our third-party manufacturers and logistics providers, and for roxadustat, our collaboration partners. We may not be able to accurately forecast supplies for commercial launch, or do so in a timely manner and our efforts to establish these manufacturing and supply chain management capabilities may not meet our requirements as to quantities, scale-up, yield, cost, potency or quality in compliance with cGMP.

We have a limited amount of roxadustat and pamrevlumab in storage, limited capacity reserved at our third-party manufactures, and there are long lead times required to manufacture and scale-up the manufacture of additional supply, as required for both late-stage clinical trials, post-approval trials, and commercial supply. If we are unable to forecast, order or manufacture sufficient quantities of roxadustat or pamrevlumab on a timely basis, it may delay our development, launch or commercialization in some or all indications we are currently pursuing. For example, prior to agreement with regulatory authorities on the scope of our Phase 3 IPF trial design, there is uncertainty as to whether our supply plans will meet our clinical requirements in a timely manner. Any delay or interruption in the supply of our product candidates or products could have a material adverse effect on our business and operations.

Our clinical trials must be conducted with product produced under applicable cGMP regulations. Failure to comply with these regulations may require us to repeat clinical trials, which would delay the regulatory approval process. We, and even an experienced third-party manufacturer, may encounter difficulties in production. Difficulties may include:

- costs and challenges associated with scale-up and attaining sufficient manufacturing yields, in particular for biologic products such as pamrevlumab, which is a monoclonal antibody;
- supply chain issues, including coordination of multiple contractors in our supply chain and securing necessary licenses (such as export licenses);
- the timely availability and shelf life requirements of raw materials and supplies;
- · quality control and quality assurance;
- shortages of qualified personnel and capital required to manufacture large quantities of product;

Table of Contents

- · compliance with regulatory requirements that vary in each country where a product might be sold;
- · capacity or forecasting limitations and scheduling availability in contracted facilities; and
- natural disasters, such as floods, storms, earthquakes, tsunamis, and droughts, or accidents such as fire, that affect facilities, possibly limit or postpone production, and increase costs.

The FDA and EMA will do their own benefit risk analysis and may reach a different conclusion than we or our partners have internally, and these regulatory authorities may base their approval decision on different analyses, data, and statistical methods than ours.*

Even if we believe we have achieved certain results based on a totality of the evidence, such as superiority or non-inferiority, in certain endpoints, populations or subpopulations, or using certain statistical methods of analysis, the FDA and EMA will each conduct their own benefit-risk analysis and may reach different conclusions, using different statistical methods, different endpoints or definitions thereof, or different patient populations or sub-populations, and regulatory authorities may change their approvability criteria based on their internal analyses and discussions with expert advisors. Regulatory authorities may approve roxadustat for fewer or more limited indications than we request or may grant approval contingent on the performance of costly post-approval clinical trials. While we will present to regulatory authorities certain pre-specified and not pre-specified sub-populations and sub-group analyses (for example, incident dialysis), multiple secondary endpoints, and multiple analytical methods (such as long-term follow up analyses), including adjusted and censored data, regulatory authorities may reject these analyses, methods, or even parts of our trial design or certain data from our studies, the rationale for our pre-specified non-inferiority margins or other portions of our statistical analysis plans. In addition, even if we are able to provide positive data with respect to certain analyses, such as incident dialysis, estimated glomerular filtration rate, hepcidin, or quality of life measures, regulatory authorities may not include such claims on any approved labeling for roxadustat, which may limit the commercialization or market opportunity for roxadustat. Further, initial topline results reported for certain studies (such as reduction of transfusion risk or hemoglobin response in the presence of inflammation), may not be representative of the data seen in all studies or may not be sustained upon further analyses or after more wide-spread use upon commercialization. The failure to obtain regulatory approval, or any label, population or other approval limitations in any jurisdiction, may significantly limit our ability to generate revenues, and any failure to obtain such approval for all of the indications and labeling claims we deem desirable could reduce our potential revenue.

Positive topline results from our Phase 3 clinical trials assessing the safety and efficacy of roxadustat may not be indicative of additional results or results for roxadustat in other indications.*

There are multiple key and secondary endpoints as well as sub-group analyses in both dialysis and non-dialysis in the U.S. and multiple secondary endpoints in addition to MACE+ as well as sub-group analyses in dialysis and non-dialysis in Europe. We continue to analyze these additional endpoints from the Phase 3 clinical trials of roxadustat in anemia of CKD, as well as from the pooled analyses, some of which may have a bearing on the safety or efficacy of roxadustat. The topline results we have reported thus far may not be indicative of these additional results. In addition, results in these CKD-anemia indications may not be indicative of our clinical trials in other indications or the safety, efficacy, or approvability of roxadustat in other indications. If these topline results are not indicative of additional results or results in other indications, our potential revenue may be reduced.

Even if we are able to obtain regulatory approval of our product candidates, the label we obtain may limit the indicated uses for which our product candidates may be marketed.*

With respect to roxadustat, regulatory approvals obtained outside of China and Japan, could limit the approved indicated uses for which roxadustat may be marketed. For example, ESAs have been subject to significant safety warnings, including the "Black Box" warnings on their labels. Refer to "Business - Roxadustat for the Treatment of Anemia in Chronic Kidney Disease - Limitations of the Current Standard of Care for Anemia in CKD" in our annual report on Form 10-K for the year ended December 31, 2018. In addition, in the past, an approved ESA was voluntarily withdrawn due to serious safety issues discovered after approval. The safety concerns relating to ESAs may result in labeling for roxadustat containing similar warnings even if our Phase 3 clinical trials do not suggest that roxadustat has similar safety issues. Even if the label for roxadustat does not contain all of the warnings contained in the "Black Box" warning for ESAs, the label for roxadustat may contain other warnings or limit the market opportunity or approved indications for roxadustat. These warnings could include warnings against exceeding specified hemoglobin targets and other warnings that derive from the lack of clarity regarding the safety issues associated with ESAs, even if our Phase 3 clinical trials do not themselves raise safety concerns.

As an organization, we have not successfully commercialized any drug product. Therefore, we may not be able to efficiently execute our development and commercialization plans.*

We are currently conducting Phase 3 clinical trials for pamrevlumab and roxadustat. The conduct of Phase 3 clinical trials and the submission of a successful NDA is a complicated process. As an organization, we have limited experience in preparing, submitting and prosecuting regulatory filings, and have not received approval for an NDA outside of China, where we received marketing authorization from the NMPA for the treatment of anemia caused by CKD in dialysis patients and non-dialysis patients, and Japan, where the Ministry of Health, Labour and Welfare approved roxadustat for the treatment of CKD in dialysis patients. Consequently, we may be unable to successfully and efficiently execute and complete necessary clinical trials and regulatory submissions in other countries or for any other product candidate we are developing, even if our earlier stage clinical trials are successful. We may require more time and incur greater costs than our competitors and may not succeed in obtaining regulatory approvals of product candidates that we develop. Failure to commence or complete, or delays in, our planned clinical trials would prevent us from or delay us in commercializing product candidates we are developing.

In addition, in order for any Phase 3 clinical trial to support an NDA submission for approval, the FDA and foreign regulatory authorities require compliance with regulations and standards, including good clinical practices ("GCP") requirements for designing, conducting, monitoring, recording, analyzing, and reporting the results of clinical trials to ensure that the data and results from trials are credible and accurate and that the rights, integrity and confidentiality of trial participants are protected. Although we rely on third parties to conduct our clinical trials, we as the sponsor remain responsible for ensuring that each of these clinical trials is conducted in accordance with its general investigational plan and protocol under legal and regulatory requirements, including GCP. Regulatory authorities enforce these GCP requirements through periodic inspections of trial sponsors, principal investigators and trial sites. If we or any of our CROs, trial sites, principal investigators or other third parties fail to comply with applicable GCP requirements, the clinical data generated in our clinical trials may be deemed unreliable and the FDA or other regulatory authorities may require us to exclude the use of patient data from our clinical trials not conducted in compliance with GCP or perform additional clinical trials before approving our marketing applications. They may even reject our application for approval or refuse to accept our future applications for an extended time period. For example in China in March 2016, the State Drug Administration, now known as the NMPA issued guidance related to its clinical trial data integrity regulations. While trial sites and CROs bear liability for the accuracy and authenticity of data they are directly responsible for, the sponsor ultimately bears full responsibility for submitted clinical data and the drug application dossier. Fraudulent clinical data could result in a ban in China of a sponsor's product-related NDA applications for three years and other NDA applications for one year. We have taken extensive steps to ensure the integrity of our China clinical data. In China, the clinical site inspections confirmed our compliance with GCP regulations and supported our approval. However, we cannot assure you that upon inspection by a regulatory authority in other regions, such regulatory authority will determine that any of our clinical trials comply with GCP requirements or that our results will be deemed authentic or may be used in support of our regulatory submissions.

If we are unable to establish sales, marketing and distribution capabilities or enter into or maintain agreements with third parties to market and sell our product candidates, we may not be successful in commercializing our product candidates if and when they are approved.

We do not have a sales or marketing infrastructure and have no experience in the sales, marketing or distribution of pharmaceutical products in any country. To achieve commercial success for any product for which we obtain marketing approval, we will need to establish sales and marketing capabilities or make and maintain our existing arrangements with third parties to perform these services at a level sufficient to support our commercialization efforts.

To the extent that we would undertake sales and marketing of any of our products directly, there are risks involved with establishing our own sales, marketing and distribution capabilities. Factors that may inhibit our efforts to commercialize our products on our own include:

- · our inability to recruit, train and retain adequate numbers of effective sales and marketing personnel;
- the inability of sales personnel to obtain access to physicians or persuade adequate numbers of physicians to prescribe any future products:
- our inability to effectively manage geographically dispersed sales and marketing teams;
- the lack of complementary products to be offered by sales personnel, which may put us at a competitive disadvantage relative to companies with more extensive product lines; and
- unforeseen costs and expenses associated with creating an independent sales and marketing organization.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 172 of 1730

Table of Contents

With respect to roxadustat, we are dependent on the commercialization capabilities of our collaboration partners, AstraZeneca and Astellas. If either such partner were to terminate its agreement with us, we would have to commercialize on our own or with another third party. We will have limited or little control over the commercialization efforts of such third parties, and any of them may fail to devote the necessary resources and attention to sell and market our products, if any, effectively. If they are not successful in commercializing our product candidates, our business and financial condition would suffer.

We face substantial competition, which may result in others discovering, developing or commercializing products before, or more successfully, than we do.*

The development and commercialization of new pharmaceutical products is highly competitive. Our future success depends on our ability to achieve and maintain a competitive advantage with respect to the development and commercialization of our product candidates. Our objective is to discover, develop and commercialize new products with superior efficacy, convenience, tolerability, and safety. We expect that in many cases, the products that we commercialize will compete with existing, market-leading products of companies that have large, established commercial organizations.

If roxadustat is approved and launched commercially, competing drugs are expected to include ESAs, particularly in those patient segments where ESAs are used. Currently available ESAs include epoetin alfa (EPOGEN ®, marketed by Amgen Inc. in the U.S., Procrit ® and Erypo ®/Eprex ®, marketed by Johnson & Johnson Inc., and Espo ® marketed by Kyowa Hakko Kirin in Japan and China), darbepoetin (Amgen/Kyowa Hakko Kirin's Aranesp ® and NESP ®) and Mircera ® marketed by Hoffmann-La Roche ("Roche") outside of the U.S. and by Vifor Pharma ("Vifor"), a Roche licensee, in the U.S. and Puerto Rico, as well as biosimilar versions of these currently marketed ESA products. ESAs have been used in the treatment of anemia in CKD for more than 20 years, serving a significant majority of DD-CKD patients. While NDD-CKD patients who are not under the care of nephrologists, including those with diabetes and hypertension, do not typically receive ESAs and are often left untreated, some patients under nephrology care may be receiving ESA therapy. It may be difficult to encourage healthcare providers and patients to switch to roxadustat from products with which they have become familiar.

We may also face competition from potential new anemia therapies currently in clinical development, including in those patient segments not currently addressed by ESAs. Companies such as GlaxoSmithKline plc ("GSK"), Bayer Corporation ("Bayer"), Akebia Therapeutics, Inc. ("Akebia"), and Japan Tobacco Inc., are currently developing HIF prolyl hydroxylase ("HIF-PH") inhibitors for anemia in CKD indications. Akebia has completed enrollment in its global Phase 3 studies in NDD-CKD and DD-CKD, while conducting additional Phase 1 and Phase 2 studies. In Japan, Mitsubishi Tanabe Pharmaceutical Corporation ("Mitsubishi Tanabe"), Akebia's collaboration partner, submitted an NDA in July 2019 for treatment of anemia in CKD patients on dialysis and not on dialysis, supported by the Phase 3 studies conducted by Mitsubishi Tanabe in Japan. GSK is conducting global Phase 3 studies in NDD-CKD and DD-CKD. In Japan, GSK submitted an NDA in August 2019 for the treatment of patients with renal anemia due to CKD. GSK and Kyowa Hakko Kirin announced in November 2018 that the two companies signed a strategic commercialization deal in Japan for daprodustat. Bayer has completed global Phase 2 studies and announced in May 2017 its HIF-PH inhibitor is now in continued development in Japan only, and its Japan Phase 3 studies in NDD-CKD and DD-CKD are expected to complete in the second half of 2019. Japan Tobacco Inc. is also conducting Phase 3 studies in NDD-CKD and DD-CKD in Japan only. Some of these product candidates may enter the market prior to roxadustat.

In addition, there are other companies developing biologic therapies for the treatment of other anemia indications that we may also seek to pursue in the future, including anemia of MDS. For example, Acceleron Pharma Inc. and its partner Celgene Corporation ("Celgene") announced in June 2019 that the U.S. FDA accepted Celgene's Biologics License Application ("BLA") for luspatercept for the treatment of adult patients with very low to intermediate risk of MDS-associated anemia who have ring sideroblasts and require red blood cell transfusions for regular review, and beta-thalassemia-associated anemia who require red blood cell transfusions for priority review, with the target action dates of April 2020 and December 2019, respectively. Celgene's marketing approval application for luspatercept has also been accepted by the European Union ("EU"), and a luspatercept Phase 2 study started in Japan. There may also be new therapies for renal-related diseases that could limit the market or level of reimbursement available for roxadustat if and when it is commercialized.

Table of Contents

In China, locally manufactured epoetin alfa are offered by Chinese pharmaceutical companies such as EPIAO marketed by 3SBio Inc. as well as more than 15 other local manufacturers. We may also face competition by HIF-PH inhibitors from other companies such as Akebia, Bayer, and GSK, which was authorized by the NMPA to conduct trials in China to support its ex-China regulatory filings. Furthermore, while it is too early to understand how the NMPA will implement its recently approved guidelines to allow multinational companies to use their ex-China clinical data in their NDAs in China, these guidelines could in theory allow competitors to accelerate their NDA applications in China. Akebia announced in December 2015 that it has entered into a development and commercialization partnership with Mitsubishi Tanabe for its HIF-PH inhibitor vadadustat in Japan, Taiwan, South Korea, India, and certain other countries in Asia, and announced in April 2017 an expansion of their U.S. collaboration with Otsuka to add markets, including China. Two Chinese domestic companies, Jiangsu Hengrui Medicine Co., Ltd. and Guangdong Sunshine Health Investment Co., Ltd., have announced they also secured the NMPA approval to conduct clinical trials for their respective HIF-PH inhibitors. 3SBio Inc. has recently filed an IND for its HIF-PH inhibitor with the NMPA.

The first biosimilar ESAs, Pfizer's Retacrit® (epoetin zeta), entered the U.S. market in November 2018. Market penetration of Retacrit® (epoetin zeta) and the potential addition of other biosimilar ESAs, currently under development, may alter the competitive and pricing landscape of anemia therapy in DD-CKD patients under the end stage renal disease bundle. The patents for Amgen's epoetin alfa, EPOGEN, expired in 2004 in the EU, and the final material patents in the U.S. expired in May 2015. Several biosimilar versions of currently marketed ESAs are available for sale in the EU, China and other territories. In the U.S., a few ESA biosimilars are currently under development. Sandoz, a division of Novartis, markets Binocrit® (epoetin alfa) in Europe and may file a biosimilar BLA in the U.S.

The majority of the current CKD anemia market focuses on dialysis patients, who visit dialysis centers on a regular basis, typically three-times a week, and anemia therapies are administered as part of the visit. Two of the largest operators of dialysis clinics in the U.S., DaVita Healthcare Partners Inc. ("DaVita") and Fresenius Medical Care AG & Co. KGaA ("Fresenius"), collectively provide dialysis care to over 80% of U.S. dialysis patients, and therefore have historically won long-term contracts including rebate terms with Amgen. In January 2017, DaVita entered into a new 6-year sourcing and supply agreement with Amgen that is effective through 2022. Fresenius' contract with Amgen expired in 2015, and Fresenius is now administering Mircera® in a significant portion of its U.S. dialysis patients since Mircera was made available by Vifor. Successful penetration of this market may require a significant agreement with Fresenius or DaVita on favorable terms and on a timely basis.

If pamrevlumab is approved and launched commercially to treat IPF, competing drugs are expected to include Roche's Esbriet® (pirfenidone) and Boehringer Ingelheim Pharma GmbH & Co. KG's Ofev® (nintedanib). Nintedanib is also in development for non-small cell lung cancer and ovarian cancer. Other potential competitive product candidates in development for IPF include Biogen-Idec's BG-00011, Galapagos NV's GLPG1690 and GLPG1205, Kadmon Holdings, Inc.'s KD025, Prometic Life Sciences Inc.'s PBI-4050, and Promedior Inc.'s PRM-151. Galapagos NV initiated a Phase 3 study for GLPG 1690 in December 2018.

If pamrevlumab is approved and launched commercially to treat locally advanced pancreatic cancer patients who are not candidates for surgical resection, pamrevlumab may face competition from agents seeking approval in combination with gemcitibine and nab-paclitaxel from companies such as NewLink Genetics Corporation and Halozyme Therapeutics, Inc. Gemcitabine and/or nab-paclitaxel are the current standard of care in the first-line treatment of metastatic pancreatic cancer. Celgene Corporation's Abraxane® (nab-paclitaxel) was launched in the U.S. and Europe in 2013 and 2014, and was the first drug approved in this disease in nearly a decade.

If pamrevlumab is approved and launched commercially to treat DMD, pamrevlumab may face competition for some patients from Sarepta Therapeutics, Inc. ("Sarepta") with Exondys 51® (eteplirsen), approved in the U.S. for patients who have a confirmed mutation in the DMD gene that is amenable to exon 51 skipping, and from PTC Therapeutics' drug ataluren approved in ambulatory patients in Europe. We may also face competition from Sarepta's golodirsen, currently under NDA review in the U.S., and agents currently in development for DMD, including PTC Therapeutics, Inc.'s ataluren, Santhera Pharmaceuticals Holding's idebone, Catabasis Pharmaceuticals, Inc.'s edasalonexent, Capricor Therapeutics Inc.'s CAP-1002, and Sarepta's casimersen and other gene therapies, if and when these agents are approved and launched.

The success of any or all of these potential competitive products may negatively impact the development and potential for success of pamrevlumab. In addition, any competitive products that are on the market or in development may compete with pamrevlumab for patient recruitment and enrollment for clinical trials or may force us to change our clinical trial design, including, in order to compare pamrevlumab against another drug, which may be the new standard of care.

Table of Contents

If FG-5200 is approved and launched in China to treat corneal blindness resulting from partial thickness corneal damage without active inflammation and infection, it is likely to compete with other products designed to treat corneal damage. For example, in April 2015, a subsidiary of China Regenerative Medicine International Limited received approval for their acellular porcine cornea stroma medical device to treat patients in China with corneal ulcers and in April 2016, Guangzhou Yourvision Biotech Co. Ltd, a subsidiary of Guanhao Biotech, received approval for their acellular porcine cornea medical device to treat patients in China with infectious keratitis that does not respond to drug treatment.

Moreover, many of our competitors have significantly greater resources than we do. Large pharmaceutical companies, in particular, have extensive experience in clinical testing, obtaining regulatory approvals, recruiting patients, manufacturing pharmaceutical products, and commercialization. In the potential anemia market for roxadustat, for example, large and established companies such as Amgen and Roche, among others, compete aggressively to maintain their market shares. In particular, the currently marketed ESA products are supported by large pharmaceutical companies that have greater experience and expertise in commercialization in the anemia market, including in securing reimbursement, government contracts and relationships with key opinion leaders; conducting testing and clinical trials; obtaining and maintaining regulatory approvals and distribution relationships to market products; and marketing approved products. These companies also have significantly greater scale, research and marketing capabilities than we do and may also have products that have been approved or are in later stages of development and have collaboration agreements in our target markets with leading dialysis companies and research institutions. These competitors have in the past successfully prevented new and competing products from entering the anemia market, and we expect that their resources will represent challenges for us and our collaboration partners, AstraZeneca and Astellas. If we and our collaboration partners are not able to compete effectively against existing and potential competitors, our business and financial condition may be materially and adversely affected.

Our future commercial success depends upon attaining significant market acceptance of our product candidates, if approved, among physicians, patients, third-party payors and others in the health care community.

Even if we obtain marketing approval for roxadustat, pamrevlumab or any other product candidates that we may develop or acquire in the future in all indications and geographic regions, these product candidates may not gain market acceptance among physicians, third-party payors, patients and others in the health care community. Market acceptance of any approved product, including in roxadustat for the treatment of anemia caused by CKD in China and Japan, depends on a number of other factors, including:

- the clinical indications for which the product is approved and the labeling required by regulatory authorities for use with the product, including any warnings that may be required in the labeling;
- acceptance by physicians and patients of the product as a safe and effective treatment and the willingness of the target patient population to try new therapies and of physicians to prescribe new therapies;
- the cost, safety, efficacy and convenience of treatment in relation to alternative treatments;
- the restrictions on the use of our products together with other medications, if any;
- the availability of adequate coverage and reimbursement or pricing by third-party payors and government authorities;
- the ability of treatment providers, such as dialysis clinics, to enter into relationships with us without violating their existing agreement;
- the effectiveness of our sales and marketing efforts.

No or limited reimbursement or insurance coverage of our approved products, if any, by third-party payors may render our products less attractive to patients and healthcare providers.

Market acceptance and sales of any approved products will depend significantly on reimbursement or coverage of our products by the Chinese government or third-party payors and may be affected by existing and future healthcare reform measures or prices of related products for which the government or third-party reimbursement applies. Coverage and reimbursement by the government or a third-party payor may depend upon a number of factors, including the payor's determination that use of a product is:

- a covered benefit under its health plan;
- safe, effective and medically necessary;
- appropriate for the specific patient;
- cost-effective; and
- neither experimental nor investigational.

The review and publication cycle for the Chinese government to update their reimbursement lists (national or provincial) is unpredictable and is outside our control.

Obtaining coverage and reimbursement approval for a product from a government or other third-party payor is a time consuming and costly process that could require us to provide supporting scientific, clinical and cost-effectiveness data for the use of our products to the payor, which we may not be able to provide. Furthermore, the reimbursement policies of third-party payors may significantly change in a manner that renders our clinical data insufficient for adequate reimbursement or otherwise limits the successful marketing of our products. Even if we obtain coverage for our product candidates, third-party payors may not establish adequate reimbursement amounts, which may reduce the demand for, or the price of, our products. If reimbursement is not available or is available only to limited levels, we may not be able to commercialize certain of our products.

Price controls may limit the price at which products such as roxadustat, if approved, are sold. For example, reference pricing is used by various EU member states and parallel distribution, or arbitrage between low-priced and high-priced member states, can further reduce prices. In some countries, we or our partner may be required to conduct a clinical trial or other studies that compare the cost-effectiveness of our product candidates to other available products in order to obtain or maintain reimbursement or pricing approval. Publication of discounts by third-party payors or authorities may lead to further pressure on the prices or reimbursement levels within the country of publication and other countries. If reimbursement of our products is unavailable or limited in scope or amount, or if pricing is set at unacceptable levels, we or our partner may elect not to commercialize our products in such countries, and our business and financial condition could be adversely affected.

Risks Related to Our Reliance on Third Parties

If our collaborations with Astellas or AstraZeneca were terminated, or if Astellas or AstraZeneca were to prioritize other initiatives over their collaborations with us, whether as a result of a change of control or otherwise, our ability to successfully develop and commercialize our lead product candidate, roxadustat, would suffer.

We have entered into collaboration agreements with respect to the development and commercialization of our lead product candidate, roxadustat, with Astellas and AstraZeneca. These agreements provide for reimbursement of our development costs by our collaboration partners and also provide for commercialization of roxadustat throughout the major territories of the world.

Our agreements with Astellas and AstraZeneca provide each of them with the right to terminate their respective agreements with us, upon the occurrence of negative clinical results, delays in the development and commercialization of our product candidates or adverse regulatory requirements or guidance. The termination of any of our collaboration agreements would require us to fund and perform the further development and commercialization of roxadustat in the affected territory, or pursue another collaboration, which we may be unable to do, either of which could have an adverse effect on our business and operations. In addition, each of those agreements provides our respective partners the right to terminate any of those agreements upon written notice for convenience. Moreover, if Astellas or AstraZeneca, or any successor entity, were to determine that their collaborations with us are no longer a strategic priority, or if either of them or a successor were to reduce their level of commitment to their collaborations with us, our ability to develop and commercialize roxadustat could suffer. In addition, some of our collaborations are exclusive and preclude us from entering into additional collaboration agreements with other parties in the area or field of exclusivity.

Table of Contents

If we fail to establish and maintain strategic collaborations related to our product candidates, we will bear all of the risk and costs related to the development and commercialization of any such product candidate, and we may need to seek additional financing, hire additional employees and otherwise develop expertise at significant cost. This in turn may negatively affect the development of our other product candidates as we direct resources to our most advanced product candidates.

Conflicts with our collaboration partners could jeopardize our collaboration agreements and our ability to commercialize product candidates.

Our collaboration partners have certain rights to control decisions regarding the development and commercialization of our product candidates with respect to which they are providing funding. If we have a disagreement over strategy and activities, our plans for obtaining approval may be revised and negatively affect the anticipated timing and potential for success of our product candidates. Even if a product under a collaboration agreement is approved, we will remain substantially dependent on the commercialization strategy and efforts of our collaboration partners, and neither of our collaboration partners has experience in commercialization of a novel drug such as roxadustat in the dialysis market.

With respect to our collaboration agreements for roxadustat, there are additional complexities in that we and our collaboration partners, Astellas and AstraZeneca, must reach consensus on our Phase 3 development program. Multi-party decision-making is complex and involves significant time and effort, and there can be no assurance that the parties will cooperate or reach consensus, or that one or both of our partners will not ask to proceed independently in some or all of their respective territories or functional areas of responsibility in which the applicable collaboration partner would otherwise be obligated to cooperate with us. Any disputes or lack of cooperation with us by either Astellas or AstraZeneca may negatively impact the timing or success of our planned Phase 3 clinical studies.

We intend to conduct proprietary research programs in specific disease areas that are not covered by our collaboration agreements. Our pursuit of such opportunities could, however, result in conflicts with our collaboration partners in the event that any of our collaboration partners takes the position that our internal activities overlap with those areas that are exclusive to our collaboration agreements, and we should be precluded from such internal activities. Moreover, disagreements with our collaboration partners could develop over rights to our intellectual property. In addition, our collaboration agreements may have provisions that give rise to disputes regarding the rights and obligations of the parties. Any conflict with our collaboration partners could lead to the termination of our collaboration agreements, delay collaborative activities, reduce our ability to renew agreements or obtain future collaboration agreements or result in litigation or arbitration and would negatively impact our relationship with existing collaboration partners.

Certain of our collaboration partners could also become our competitors in the future. If our collaboration partners develop competing products, fail to obtain necessary regulatory approvals, terminate their agreements with us prematurely or fail to devote sufficient resources to the development and commercialization of our product candidates, the development and commercialization of our product candidates and products could be delayed.

We rely on third parties for the conduct of most of our preclinical and clinical trials for our product candidates, and if our third-party contractors do not properly and successfully perform their obligations under our agreements with them, we may not be able to obtain or may be delayed in receiving regulatory approvals for our product candidates.

We rely heavily on university, hospital, dialysis centers and other institutions and third parties, including the principal investigators and their staff, to carry out our clinical trials in accordance with our clinical protocols and designs. We also rely on a number of third-party CROs to assist in undertaking, managing, monitoring and executing our ongoing clinical trials, including those for roxadustat. We expect to continue to rely on CROs, clinical data management organizations, medical institutions and clinical investigators to conduct our development efforts in the future, including our Phase 3 development program for roxadustat. We compete with many other companies for the resources of these third parties, and large pharmaceutical companies often have significantly more extensive agreements and relationships with such third-party providers, and such third-party providers may prioritize the requirements of such large pharmaceutical companies over ours. The third parties on whom we rely may terminate their engagements with us at any time, which may cause delay in the development and commercialization of our product candidates. If any such third party terminates its engagement with us or fails to perform as agreed, we may be required to enter into alternative arrangements, which would result in significant cost and delay to our product development program. Moreover, our agreements with such third parties generally do not provide assurances regarding employee turnover and availability, which may cause interruptions in the research on our product candidates by such third parties.

Table of Contents

Moreover, while our reliance on these third parties for certain development and management activities will reduce our control over these activities, it will not relieve us of our responsibilities. For example, the FDA and foreign regulatory authorities require compliance with regulations and standards, including GCP requirements for designing, conducting, monitoring, recording, analyzing and reporting the results of clinical trials to ensure that the data and results from trials are credible and accurate and that the rights, integrity and confidentiality of trial participants are protected. Although we rely on third parties to conduct our clinical trials, we, as the sponsor, remain responsible for ensuring that each of these clinical trials is conducted in accordance with its general investigational plan and protocol under legal and regulatory requirements, including GCP. Regulatory authorities enforce these GCP requirements through periodic inspections of trial sponsors, principal investigators and trial sites.

If any of our CROs, trial sites, principal investigators or other third parties fail to comply with applicable GCP requirements, other regulations, trial protocol or other requirements under their agreements with us, the quality or accuracy of the data they obtain may be compromised or unreliable, and the trials of our product candidates may not meet regulatory requirements. If trials do not meet regulatory requirements or if these third parties need to be replaced, the development of our product candidates may be delayed, suspended or terminated, regulatory authorities may require us to exclude the use of patient data from our approval applications or perform additional clinical trials before approving our marketing applications. Regulatory authorities may even reject our application for approval or refuse to accept our future applications for an extended time period. We cannot assure that upon inspection by a regulatory authority, such regulatory authority will determine that any of our clinical trials comply with GCP requirements or that our results may be used in support of our regulatory submissions. If any of these events occur, we may not be able to obtain regulatory approval for our product candidates on a timely basis, at a reasonable cost, or at all.

We currently rely, and expect to continue to rely, on third parties to conduct many aspects of our clinical studies and product manufacturing, and these third parties may not perform satisfactorily.

We do not have operating manufacturing facilities at this time other than our roxadustat and FG-5200 manufacturing facility in China, and our current commercial manufacturing facility plans in China are not expected to satisfy the requirements necessary to support development and commercialization outside of China. Other than in and for China specifically, we do not expect to independently manufacture our products. We currently rely, and expect to continue to rely, on third parties to scale-up, manufacture and supply roxadustat and our other product candidates outside of China. Risks arising from our reliance on third-party manufacturers include:

- reduced control and additional burdens of oversight as a result of using third-party manufacturers for all aspects of manufacturing activities, including regulatory compliance and quality control and quality assurance;
- termination of manufacturing agreements, termination fees associated with such termination, or nonrenewal of manufacturing
 agreements with third parties may negatively impact our planned development and commercialization activities;
- · the possible misappropriation of our proprietary technology, including our trade secrets and know-how; and
- disruptions to the operations of our third-party manufacturers or suppliers unrelated to our product, including the merger, acquisition, or bankruptcy of a manufacturer or supplier or a catastrophic event affecting our manufacturers or suppliers.

Any of these events could lead to development delays or failure to obtain regulatory approval or affect our ability to successfully commercialize our product candidates. Some of these events could be the basis for action by the FDA or another regulatory authority, including injunction, recall, seizure or total or partial suspension of production.

Table of Contents

The facilities used by our contract manufacturers to manufacture our product candidates must pass inspections by the FDA and other regulatory authorities. Although, except for China, we do not control the manufacturing operations of, and expect to remain completely dependent on, our contract manufacturers for manufacture of drug substance and finished drug product, we are ultimately responsible for ensuring that our product candidates are manufactured in compliance with cGMP requirements. If our contract manufacturers cannot successfully manufacture material that conforms to our or our collaboration partners' specifications, or the regulatory requirements of the FDA or other regulatory authorities, we may not be able to secure and/or maintain regulatory approval for our product candidates and our development or commercialization plans may be delayed. In addition, we have no control over the ability of our contract manufacturers to maintain adequate quality control, quality assurance and qualified personnel. In addition, although our longer-term agreements are expected to provide for requirements to meet our quantity and quality requirements to manufacture our products candidates for clinical studies and commercial sale, we will have minimal direct control over the ability of our contract manufacturers to maintain adequate quality control, quality assurance and qualified personnel and we expect to rely on our audit rights to ensure that those qualifications are maintained to meet our requirements. If our contract manufacturers' facilities do not pass inspection by regulatory authorities, or if regulatory authorities do not approve these facilities for the manufacture of our products, or withdraw any such approval in the future, we would need to identify and qualify alternative manufacturing facilities, which would significantly impact our ability to develop, obtain regulatory approval for or market our products, if approved. Moreover, any failure of our third-party manufacturers, to comply with applicable regulations could result in sanctions being imposed on us or adverse regulatory consequences, including clinical holds, warnings or untitled letters, fines, injunctions, civil penalties, delays, suspension or withdrawal of approvals, license revocation, seizures or recalls of product candidates or products, operating restrictions and criminal prosecutions, any of which would be expected to significantly and adversely affect supplies of our products to us and our collaboration partners.

Any of our third-party manufacturers may terminate their engagement with us at any time and we have not yet entered into any commercial supply agreements for the manufacture of active pharmaceutical ingredient ("API") or drug products. With respect to roxadustat, AstraZeneca and Astellas have certain rights to assume manufacturing of roxadustat and the existence of those rights may limit our ability to enter into favorable long-term supply agreements, if at all, with other third-party manufacturers. In addition, our product candidates and any products that we may develop may compete with other product candidates and products for access and prioritization to manufacture. Certain third-party manufacturers may be contractually prohibited from manufacturing our product due to non-compete agreements with our competitors or a commitment to grant another party priority relative to our products. There are a limited number of third-party manufacturers that operate under cGMP and that might be capable of manufacturing to meet our requirements. Due to the limited number of third-party manufacturers with the contractual freedom, expertise, required regulatory approvals and facilities to manufacture our products on a commercial scale, identifying and qualifying a replacement third-party manufacturer would be expensive and time-consuming and may cause delay or interruptions in the production of our product candidates or products, which in turn may delay, prevent or impair our development and commercialization efforts.

We have a letter agreement with IRIX Pharmaceuticals, Inc. ("IRIX"), a third-party manufacturer that we have used in the past, pursuant to which we agreed to negotiate a single source manufacturing agreement that included a right of first negotiation for the cGMP manufacture of HIF-PH inhibitors, including roxadustat, provided that IRIX is able to match any third-party bids within 5%. The exclusive right to manufacture extends for five years after approval of an NDA for those compounds, and any agreement would provide that no minimum amounts would be specified until appropriate by forecast and that we and a commercialization partner would have the rights to contract with independent third parties that exceed IRIX's internal manufacturing capabilities or in the event that we or our commercialization partner determines for reasons of continuity of supply and security that such a need exists, provided that IRIX would supply no less than 65% of the product if it is able to provide this level of supply. Subsequent to the letter agreement, we and IRIX have entered into several additional service agreements. IRIX has requested in writing that we honor the letter agreement with respect to the single source manufacturing agreement, and if we were to enter into any such exclusive manufacturing agreement, there can be no assurance that IRIX will not assert a claim for right to manufacture roxadustat or that IRIX could manufacture roxadustat successfully and in accordance with applicable regulations for a commercial product and the specifications of our collaboration partners. In 2015, Patheon Pharmaceuticals Inc., a business unit of DPx Holdings B.V. ("Patheon"), acquired IRIX, and in 2017 ThermoFisher Scientific Inc. acquired Patheon.

If any third-party manufacturer terminates its engagement with us or fails to perform as agreed, we may be required to find replacement manufacturers, which would result in significant cost and delay to our development programs. Although we believe that there are several potential alternative manufacturers who could manufacture our product candidates, we may incur significant delays and added costs in identifying, qualifying and contracting with any such third party or potential second source manufacturer. In any event, with any third-party manufacturer we expect to enter into technical transfer agreements and share our know-how with the third-party manufacturer, which can be time-consuming and may result in delays. These delays could result in a suspension or delay of marketing roxadustat.

Certain of the components of our product candidates are acquired from single-source suppliers and have been purchased without long-term supply agreements. The loss of any of these suppliers, or their failure to supply us with supplies of sufficient quantity and quality to complete our drug substance or finished drug product of acceptable quality and an acceptable price, would materially and adversely affect our business.

We do not have an alternative supplier of certain components of our product candidates. To date, we have used purchase orders for the supply of materials that we use in our product candidates. We may be unable to enter into long-term commercial supply arrangements with our vendors, or do so on commercially reasonable terms, which could have a material adverse impact upon our business. In addition, we currently rely on our contract manufacturers to purchase from third-party suppliers some of the materials necessary to produce our product candidates. We do not have direct control over the acquisition of those materials by our contract manufacturers. Moreover, we currently do not have any agreements for the commercial production of those materials.

The logistics of our supply chain, which include shipment of materials and intermediates from countries such as China and India add additional time and risk (including risk of loss) to the manufacture of our product candidates. While we have in the past maintained sufficient inventory of materials, active pharmaceutical ingredient ("API"), and drug product to meet our and our collaboration partners' needs for roxadustat to date, the lead time and regulatory approvals required to source from and into countries outside of the U.S. increase the risk of delay and potential shortages of supply.

Risks Related to Our Intellectual Property

If our efforts to protect our proprietary technologies are not adequate, we may not be able to compete effectively in our market.

We rely upon a combination of patents, trade secret protection and contractual arrangements to protect the intellectual property related to our technologies. We will only be able to protect our products and proprietary information and technology by preventing unauthorized use by third parties to the extent that our patents, trade secrets, and contractual position allow us to do so. Any disclosure to or misappropriation by third parties of our trade secrets or confidential information could compromise our competitive position. Moreover, we are involved in, have in the past been involved in, and may in the future be involved in legal or administrative proceedings involving our intellectual property initiated by third parties, and which proceedings can result in significant costs and commitment of management time and attention. As our product candidates continue in development, third parties may attempt to challenge the validity and enforceability of our patents and proprietary information and technologies.

We also are involved in, have in the past been involved in, and may in the future be involved in initiating legal or administrative proceedings involving the product candidates and intellectual property of our competitors. These proceedings can result in significant costs and commitment of management time and attention, and there can be no assurance that our efforts would be successful in preventing or limiting the ability of our competitors to market competing products.

Composition-of-matter patents relating to the API are generally considered to be the strongest form of intellectual property protection for pharmaceutical products, as such patents provide protection not limited to any one method of use. Method-of-use patents protect the use of a product for the specified method(s), and do not prevent a competitor from making and marketing a product that is identical to our product for an indication that is outside the scope of the patented method. We rely on a combination of these and other types of patents to protect our product candidates, and there can be no assurance that our intellectual property will create and sustain the competitive position of our product candidates.

Biotechnology and pharmaceutical product patents involve highly complex legal and scientific questions and can be uncertain. Any patent applications that we own or license may fail to result in issued patents. Even if patents do successfully issue from our applications, third parties may challenge their validity or enforceability, which may result in such patents being narrowed, invalidated, or held unenforceable. Even if our patents and patent applications are not challenged by third parties, those patents and patent applications may not prevent others from designing around our claims and may not otherwise adequately protect our product candidates. If the breadth or strength of protection provided by the patents and patent applications we hold with respect to our product candidates is threatened, competitors with significantly greater resources could threaten our ability to commercialize our product candidates. Discoveries are generally published in the scientific literature well after their actual development, and patent applications in the U.S. and other countries are typically not published until 18 months after their filing, and in some cases are never published. Therefore, we cannot be certain that we or our licensors were the first to make the inventions claimed in our owned and licensed patents or patent applications, or that we or our licensors were the first to file for patent protection covering such inventions. Subject to meeting other requirements for patentability, for U.S. patent applications filed prior to March 16, 2013, the first to invent the claimed invention is entitled to receive patent protection for that invention while, outside the U.S., the first to file a patent application encompassing the invention is entitled to patent protection for the invention. The U.S. moved to a "first to file" system under the Leahy-Smith America Invents Act ("AIA"), effective March 16, 2013. This system also includes procedures for challenging issued patents and pending patent applications, which creates additional uncertainty. We may become involved in opposition or interference proceedings challenging our patents and patent applications or the patents and patent applications of others, and the outcome of any such proceedings are highly uncertain. An unfavorable outcome in any such proceedings could reduce the scope of or invalidate our patent rights, allow third parties to commercialize our technology and compete directly with us, or result in our inability to manufacture, develop or commercialize our product candidates without infringing the patent rights of others.

Table of Contents

In addition to the protection afforded by patents, we seek to rely on trade secret protection and confidentiality agreements to protect proprietary know-how, information, or technology that is not covered by our patents. Although our agreements require all of our employees to assign their inventions to us, and we require all of our employees, consultants, advisors and any third parties who have access to our trade secrets, proprietary know-how and other confidential information and technology to enter into appropriate confidentiality agreements, we cannot be certain that our trade secrets, proprietary know-how and other confidential information and technology will not be subject to unauthorized disclosure or that our competitors will not otherwise gain access to or independently develop substantially equivalent trade secrets, proprietary know-how and other information and technology. Furthermore, the laws of some foreign countries, in particular, China, where we have operations, do not protect proprietary rights to the same extent or in the same manner as the laws of the U.S. As a result, we may encounter significant problems in protecting and defending our intellectual property globally. If we are unable to prevent unauthorized disclosure of our intellectual property related to our product candidates and technology to third parties, we may not be able to establish or maintain a competitive advantage in our market, which could materially adversely affect our business and operations.

Intellectual property disputes with third parties and competitors may be costly and time consuming, and may negatively affect our competitive position.*

Our commercial success may depend on our avoiding infringement of the patents and other proprietary rights of third parties as well as on enforcing our patents and other proprietary rights against third parties. Pharmaceutical and biotechnology intellectual property disputes are characterized by complex, lengthy and expensive litigation over patents and other intellectual property rights. We may initiate or become party to or be threatened with future litigation or other proceedings regarding intellectual property rights with respect to our product candidates and competing products.

As our product candidates progress toward commercialization, we or our collaboration partners may be subject to patent infringement claims from third parties. We attempt to ensure that our product candidates do not infringe third-party patents and other proprietary rights. However, the patent landscape in competitive product areas is highly complex, and there may be patents of third parties of which we are unaware that may result in claims of infringement. Accordingly, there can be no assurance that our product candidates do not infringe proprietary rights of third parties, and parties making claims against us may seek and obtain injunctive or other equitable relief, which could potentially block further efforts to develop and commercialize our product candidates including roxadustat or pamrevlumab. Any litigation involving defense against claims of infringement, regardless of the merit of such claims, would involve substantial litigation expense and would be a substantial diversion of management time.

We may consider administrative proceedings and other means for challenging third-party patents and patent applications. An unfavorable outcome in any such challenge could require us to cease using the related technology and to attempt to license rights to it from the prevailing third party, which may not be available on commercially reasonable terms, if at all, in which case our business could be harmed.

We intend, if necessary, to vigorously enforce our intellectual property in order to protect the proprietary position of our product candidates, including roxadustat and pamrevlumab. In addition, our collaboration partners who have been granted licenses to our patents may also have rights related to enforcement of those patents. Active efforts to enforce our patents by us or by our partners may include litigation, administrative proceedings, or both, depending on the potential benefits that might be available from those actions and the costs associated with undertaking those efforts against third parties. We carefully review and monitor publicly available information regarding products that may be competitive with our product candidates and assert our intellectual property rights where appropriate. For example, we previously prevailed in an administrative challenge initiated by a major biopharmaceutical company regarding our intellectual property rights, maintaining our intellectual property in all relevant scope, and will continue to protect and enforce our intellectual property rights. In addition, our partner Astellas has recently initiated *quia timet* infringement actions against Akebia and GSK based on our specific patents in the United Kingdom in response to actions taken by Akebia and GSK against those patents, as further detailed below.

Third parties may also challenge our patents and patent applications, through interference, reexamination, *inter partes* review, and post-grant review proceedings before the U.S. Patent and Trademark Office ("USPTO") or through comparable proceedings in other territories. For example, Akebia and others have filed oppositions against certain European patents within our HIF anemia-related technologies patent portfolio. In three of these proceedings, for FibroGen European Patent Nos. 1463823, 1633333, and 2322155, the European Patent Office has handed down decisions unfavorable to FibroGen. In a fourth of these proceedings, the European Patent Office issued a decision favorable to FibroGen, maintaining FibroGen European Patent No. 2322153 in amended form. All of these decisions are currently under appeal, and these four patents are valid and enforceable pending resolution of the appeals. The ultimate outcomes of such proceedings remain uncertain, and ultimate resolution of the appeals may take two years or longer. In addition, Akebia recently filed oppositions against FibroGen European Patent Nos. 2289531 and 2298301. As mentioned above, Akebia and GSK have also initiated actions in the United Kingdom against the United Kingdom counterparts of each of these European Patent Nos. 2322153 and 2322155) with respect to its daprodustat product. Akebia is also pursuing invalidation actions against corresponding patents in Canada and in Japan. While we believe the ultimate outcome of all proceedings will be that these FibroGen patents will be upheld in relevant part, we note that narrowing or even revocation of any of these patents would not affect our exclusivity for roxadustat or our freedom-to-operate with respect to use of roxadustat for the treatment of anemia.

Oppositions have also recently been filed against our European Patent No. 2872488, which claims a crystalline form of roxadustat.

Furthermore, there is a risk that any public announcements concerning the status or outcomes of intellectual property litigation or administrative proceedings may adversely affect the price of our stock. If securities analysts or our investors interpret such status or outcomes as negative or otherwise creating uncertainty, our common stock price may be adversely affected.

Our reliance on third parties and agreements with collaboration partners requires us to share our trade secrets, which increases the possibility that a competitor may discover them or that our trade secrets will be misappropriated or disclosed.

Our reliance on third-party contractors to develop and manufacture our product candidates is based upon agreements that limit the rights of the third parties to use or disclose our confidential information, including our trade secrets and know-how. Despite the contractual provisions, the need to share trade secrets and other confidential information increases the risk that such trade secrets and information are disclosed or used, even if unintentionally, in violation of these agreements. In the highly competitive markets in which our product candidates are expected to compete, protecting our trade secrets, including our strategies for addressing competing products, is imperative, and any unauthorized use or disclosure could impair our competitive position and may have a material adverse effect on our business and operations.

In addition, our collaboration partners are larger, more complex organizations than ours, and the risk of inadvertent disclosure of our proprietary information may be increased despite their internal procedures and contractual obligations in place with our collaboration partners. Despite our efforts to protect our trade secrets and other confidential information, a competitor's discovery of such trade secrets and information could impair our competitive position and have an adverse impact on our business.

We have an extensive worldwide patent portfolio. The cost of maintaining our patent protection is high and maintaining our patent protection requires continuous review and compliance in order to maintain worldwide patent protection. We may not be able to effectively maintain our intellectual property position throughout the major markets of the world.

The USPTO and foreign patent authorities require maintenance fees and payments as well as continued compliance with a number of procedural and documentary requirements. Noncompliance may result in abandonment or lapse of the subject patent or patent application, resulting in partial or complete loss of patent rights in the relevant jurisdiction. Non-compliance may result in reduced royalty payments for lack of patent coverage in a particular jurisdiction from our collaboration partners or may result in competition, either of which could have a material adverse effect on our business.

We have made, and will continue to make, certain strategic decisions in balancing costs and the potential protection afforded by the patent laws of certain countries. As a result, we may not be able to prevent third parties from practicing our inventions in all countries throughout the world, or from selling or importing products made using our inventions in and into the U.S. or other countries. Third parties may use our technologies in territories in which we have not obtained patent protection to develop their own products and, further, may infringe our patents in territories which provide inadequate enforcement mechanisms, even if we have patent protection. Such third-party products may compete with our product candidates, and our patents or other intellectual property rights may not be effective or sufficient to prevent them from competing.

The laws of some foreign countries do not protect proprietary rights to the same extent as do the laws of the U.S., and we may encounter significant problems in securing and defending our intellectual property rights outside the U.S.

Many companies have encountered significant problems in protecting and defending intellectual property rights in certain countries. The legal systems of certain countries, particularly certain developing countries such as China, do not always favor the enforcement of patents, trade secrets, and other intellectual property rights, particularly those relating to pharmaceutical and biotechnology products, which could make it difficult for us to stop infringement of our patents, misappropriation of our trade secrets, or marketing of competing products in violation of our proprietary rights. In China, our intended establishment of significant operations will depend in substantial part on our ability to effectively enforce our intellectual property rights in that country. Proceedings to enforce our intellectual property rights in foreign countries could result in substantial costs and divert our efforts and attention from other aspects of our business, and could put our patents in these territories at risk of being invalidated or interpreted narrowly, or our patent applications at risk of not being granted, and could provoke third parties to assert claims against us. We may not prevail in all legal or other proceedings that we may initiate and, if we were to prevail, the damages or other remedies awarded, if any, may not be commercially meaningful. Accordingly, our efforts to enforce our intellectual property rights around the world may be inadequate to obtain a significant commercial advantage from the intellectual property that we develop or license.

Intellectual property rights do not address all potential threats to any competitive advantage we may have.

The degree of future protection afforded by our intellectual property rights is uncertain because intellectual property rights have limitations, and intellectual property rights may not adequately protect our business or permit us to maintain our competitive advantage. The following examples are illustrative:

- Others may be able to make compounds that are the same as or similar to our current or future product candidates but that are not
 covered by the claims of the patents that we own or have exclusively licensed.
- We or any of our licensors or strategic partners might not have been the first to make the inventions covered by the issued patent or pending patent application that we own or have exclusively licensed.
- We or any of our licensors or strategic partners might not have been the first to file patent applications covering certain of our inventions.
- Others may independently develop similar or alternative technologies or duplicate any of our technologies without infringing our intellectual property rights.
- The prosecution of our pending patent applications may not result in granted patents.
- Granted patents that we own or have exclusively licensed may not provide us with any competitive advantages, or may be held invalid
 or unenforceable, as a result of legal challenges by our competitors.
- Patent protection on our product candidates may expire before we are able to develop and commercialize the product, or before we are able to recover our investment in the product.
- Our competitors might conduct research and development activities in the U.S. and other countries that provide a safe harbor from
 patent infringement claims for such activities, as well as in countries in which we do not have patent rights, and may then use the
 information learned from such activities to develop competitive products for sale in markets where we intend to market our product
 candidates.

Roxadustat is considered a Class 2 substance on the 2019 World Anti-Doping Agency Prohibited List which could limit sales and increase security and distribution costs for us and our partners, particularly in China.

Roxadustat is considered a Class 2 substance on the World Anti-Doping Agency ("WADA") Prohibited List. There are enhanced security and distribution procedures we and our collaboration partners and third-party contractors will have to take to limit the risk of loss of product in the supply chain. As a result, our distribution, manufacturing and sales costs for roxadustat, as well as for our partners, will be increased which will reduce profitability. In addition, there is a risk of reduced sales due to patient access to this drug. This is particularly the case in China where we will not be able to sell roxadustat in private pharmacies due to the WADA classification. While private pharmacies only represent approximately 10% of the market in China, this will negatively affect sales and therefore the profitability of roxadustat and the Company as a whole.

The existence of counterfeit pharmaceutical products in pharmaceutical markets may compromise our brand and reputation and have a material adverse effect on our business, operations and prospects.

Counterfeit products, including counterfeit pharmaceutical products, are a significant problem, particularly in China. Counterfeit pharmaceuticals are products sold or used for research under the same or similar names, or similar mechanism of action or product class, but which are sold without proper licenses or approvals, and are often lower cost, lower quality, different potency, or have different ingredients or formulations, and have the potential to damage the reputation for quality and effectiveness of the genuine product. Such products may be used for indications or purposes that are not recommended or approved or for which there is no data or inadequate data with regard to safety or efficacy. Such products divert sales from genuine products. If counterfeit pharmaceuticals illegally sold or used for research result in adverse events or side effects to consumers, we may be associated with any negative publicity resulting from such incidents. Consumers may buy counterfeit pharmaceuticals that are in direct competition with our pharmaceuticals, which could have an adverse impact on our revenues, business and results of operations. In addition, the use of counterfeit products could be used in non-clinical or clinical studies, or could otherwise produce undesirable side effects or adverse events that may be attributed to our products as well, which could cause us or regulatory authorities to interrupt, delay or halt clinical trials and could result in the delay or denial of regulatory approval by the FDA or other regulatory authorities and potential product liability claims. With respect to China, although the government has recently been increasingly active in policing counterfeit pharmaceuticals, there is not yet an effective counterfeit pharmaceutical regulation control and enforcement system in China. As a result, we may not be able to prevent third parties from selling or purporting to sell our products in China. The proliferation of counterfeit pharmaceuticals has grown in recent years and may continue to grow in the future. The existence of and any increase in the sales and production of counterfeit pharmaceuticals, or the technological capabilities of counterfeiters, could negatively impact our revenues, brand reputation, business and results of operations.

Risks Related to Government Regulation

The regulatory approval process is highly uncertain and we may not obtain regulatory approval for the commercialization of our product candidates.

The time required to obtain approval by the FDA and comparable foreign regulatory authorities is unpredictable, but typically takes many years following the commencement of preclinical studies and clinical trials and depends upon numerous factors, including the substantial discretion of the regulatory authorities. In addition, approval policies, regulations, or the type and amount of clinical data necessary to gain approval may change during the course of a product candidate's clinical development and may vary among jurisdictions. Except for roxadustat in China for patients on dialysis and not on dialysis, and Japan for patients on dialysis, we have not obtained regulatory approval for any product candidate, and it is possible that neither roxadustat nor pamrevlumab, nor any future product candidates we may discover, in-license or acquire and seek to develop in the future, will obtain regulatory approval in countries other than China and Japan.

Our product candidates could fail to receive regulatory approval from the FDA or other regulatory authorities for many reasons, including:

- disagreement over the design or implementation of our clinical trials;
- failure to demonstrate that a product candidate is safe and effective for its proposed indication;
- failure of clinical trials to meet the level of statistical significance required for approval;
- failure to demonstrate that a product candidate's clinical and other benefits outweigh its safety risks;
- disagreement over our interpretation of data from preclinical studies or clinical trials;
- disagreement over whether to accept efficacy results from clinical trial sites outside the U.S. where the standard of care is potentially different from that in the U.S.;
- the insufficiency of data collected from clinical trials of our present or future product candidates to support the submission and filing of an NDA or other submission or to obtain regulatory approval;
- disapproval of the manufacturing processes or facilities of either our manufacturing plant or third-party manufacturers with whom we contract for clinical and commercial supplies; or
- · changes in the approval policies or regulations that render our preclinical and clinical data insufficient for approval.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 184 of 1730

Table of Contents

The FDA or other regulatory authorities may require more information, including additional preclinical or clinical data to support approval, which may delay or prevent approval and our commercialization plans, or we may decide to abandon the development program altogether. Even if we do obtain regulatory approval, our product candidates may be approved for fewer or more limited indications than we request, approval may be contingent on the performance of costly post-marketing clinical trials, or approval may require labeling that does not include the labeling claims necessary or desirable for the successful commercialization of that product candidate. In addition, if our product candidates produce undesirable side effects or safety issues, the FDA may require the establishment of REMS or other regulatory authorities may require the establishment of a similar strategy, that may restrict distribution of our approved products, if any, and impose burdensome implementation requirements on us. Any of the foregoing scenarios could materially harm the commercial prospects for our product candidates.

Even if we believe our current or planned clinical trials are successful, regulatory authorities may not agree that our completed clinical trials provide adequate data on safety or efficacy. Approval by one regulatory authority does not ensure approval by any other regulatory authority. However, a failure or delay in obtaining regulatory approval in one country may have a negative effect on the regulatory process in others. We may not be able to file for regulatory approvals and even if we file we may not receive the necessary approvals to commercialize our product candidates in any market.

If our product candidates obtain marketing approval, we will be subject to more extensive healthcare laws, regulation and enforcement and our failure to comply with those laws could have a material adverse effect on our results of operations and financial condition.

If we obtain approval in the U.S. for any of our product candidates, the regulatory requirements applicable to our operations, in particular our sales and marketing efforts, will increase significantly with respect to our operations and the potential for civil and criminal enforcement by the federal government and the states and foreign governments will increase with respect to the conduct of our business. The laws that may affect our operations in the U.S. include:

- the federal Anti-Kickback Statute, which prohibits, among other things, persons from knowingly and willfully soliciting, receiving,
 offering or paying remuneration, directly or indirectly, to induce, or in return for, the purchase or recommendation of an item or service
 reimbursable under a federal healthcare program, such as the Medicare and Medicaid programs;
- federal civil and criminal false claims laws and civil monetary penalty laws, which prohibit, among other things, individuals or entities from knowingly presenting, or causing to be presented, claims for payment from Medicare, Medicaid, or other third-party payors that are false or fraudulent;
- the Health Insurance Portability and Accountability Act of 1996 ("HIPAA"), which created new federal criminal statutes that prohibit executing a scheme to defraud any healthcare benefit program and making false statements relating to healthcare matters;
- HIPAA, as amended by Health Information Technology and Clinical Health Act, and its implementing regulations, which imposes
 certain requirements relating to the privacy, security, and transmission of individually identifiable health information;
- the federal physician sunshine requirements under the Patient Protection and Affordable Care Act ("PPACA"), which requires
 manufacturers of drugs, devices, biologics, and medical supplies to report annually to the Centers for Medicare and Medicaid Services
 ("CMS"), information related to payments and other transfers of value to physicians, other healthcare providers, and teaching
 hospitals, and ownership and investment interests held by physicians and other healthcare providers and their immediate family
 members;

Table of Contents

- foreign and state law equivalents of each of the above federal laws, such as the U.S. Foreign Corrupt Practices Act ("FCPA"), anti-kickback and false claims laws that may apply to items or services reimbursed by any third-party payor, including commercial insurers; state laws that require pharmaceutical companies to comply with the pharmaceutical industry's voluntary compliance guidelines and the applicable compliance guidance promulgated by the federal government, or otherwise restrict payments that may be made to healthcare providers and other potential referral sources; state laws that require drug manufacturers to report information related to payments and other transfers of value to physicians and other healthcare providers or marketing expenditures; and state laws governing the privacy and security of health information in certain circumstances, many of which differ from each other in significant ways, thus complicating compliance efforts; and
- the Trade Agreements Act ("TAA"), which requires that drugs sold to the U.S. Government must be manufactured in the U.S. or in TAA approved and designated countries. Drugs manufactured in countries not approved under the TAA, may not be sold to the U.S. without specific regulatory approval. We have little experience with this regulation and there is a risk that drugs made from Chinesemade API may not be sold to an entity of the U.S. such as the Veterans Health Administration ("VA") due to our inability to obtain regulatory approval. While there have been recent VA policy changes that appear to allow for sale of drugs from non-TAA approved countries, this policy may change or there may be additional policies or legislation that affect our ability to sell drug to the U.S. Government.

The scope of these laws and our lack of experience in establishing the compliance programs necessary to comply with this complex and evolving regulatory environment increases the risks that we may unknowingly violate the applicable laws and regulations. If our operations are found to be in violation of any of such laws or any other governmental regulations that apply to us, we may be subject to penalties, including civil and criminal penalties, damages, fines, the curtailment or restructuring of our operations, the exclusion from participation in federal and state healthcare programs and imprisonment, any of which could materially adversely affect our ability to operate our business and our financial results.

The impact of recent U.S. healthcare reform, its potential partial or full repeal, and other changes in the healthcare industry and in healthcare spending is currently unknown, and may adversely affect our business model.

The commercial potential for our approved products could be affected by changes in healthcare spending and policy in the U.S. and abroad. We operate in a highly regulated industry and new laws, regulations or judicial decisions, or new interpretations of existing laws, regulations or decisions, related to healthcare availability, the method of delivery or payment for healthcare products and services could negatively impact our business, operations and financial condition.

In the U.S., the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 ("MMA") altered Medicare coverage and payments for pharmaceutical products. The legislation expanded Medicare coverage for drug purchases by the elderly and introduced a new reimbursement methodology based on average sales prices for physician-administered drugs. The MMA also provided authority for limiting the number of drugs that will be covered in any therapeutic class and as a result, we expect that there will be additional pressure to reduce costs. For example, the CMS in implementing the MMA has enacted regulations that reduced capitated payments to dialysis providers. These cost reduction initiatives and other provisions of the MMA could decrease the scope of coverage and the price that may be received for any approved dialysis products and could seriously harm our business and financial condition. While the MMA applies only to drug benefits for Medicare beneficiaries, private payors often follow Medicare coverage policies and payment limitations in setting their own reimbursement rates, and any reduction in reimbursement that results from the MMA may cause a similar reduction in payments from private payors. Similar regulations or reimbursement policies have been enacted in many international markets which could similarly impact the commercial potential for our products.

Under the Medicare Improvements for Patients and Providers Act ("MIPPA"), a basic case-mix adjusted composite, or bundled, payment system commenced in January 2011 and transitioned fully by January 2014 to a single reimbursement rate for drugs and all services furnished by renal dialysis centers for Medicare beneficiaries with end-stage renal disease. Specifically, under MIPPA the bundle now covers drugs, services, lab tests and supplies under a single treatment base rate for reimbursement by the CMS based on the average cost per treatment, including the cost of ESAs and IV iron doses, typically without adjustment for usage. It is unknown whether roxadustat, if approved in the U.S., will be included in the payment bundle. Under MIPPA, agents that have no IV equivalent in the bundle are currently expected to be excluded from the bundle until 2025. If roxadustat were included in the bundle, it may reduce the price that could be charged for roxadustat, and therefore potentially limit our profitability. Based on roxadustat's differentiated mechanism of action and therapeutic effects, and discussions with our collaboration partner, we currently believe that roxadustat might not be included in the bundle. If roxadustat is reimbursed outside of the bundle, it may potentially limit or delay market penetration of roxadustat.

Table of Contents

More recently, the PPACA was enacted in 2010 with a goal of reducing the cost of healthcare and substantially changing the way healthcare is financed by both government and private insurers. The PPACA, among other things, increases the minimum Medicaid rebates owed by manufacturers under the Medicaid Drug Rebate Program and extends the rebate program to individuals enrolled in Medicaid managed care organizations, establishes annual fees and taxes on manufacturers of certain branded prescription drugs, and creates a new Medicare Part D coverage gap discount program, in which manufacturers must agree to offer 50% point-of-sale discounts off negotiated prices of applicable brand drugs to eligible beneficiaries during their coverage gap period as a condition for the manufacturer's outpatient drugs to be covered under Medicare Part D. In addition, other legislative changes have been proposed and adopted in the U.S. since the PPACA was enacted. On August 2, 2011, the Budget Control Act of 2011 created measures for spending reductions by Congress. A Joint Select Committee on Deficit Reduction, tasked with recommending a targeted deficit reduction of at least \$1.2 trillion for the years 2013 through 2021, was unable to reach required goals, thereby triggering the legislation's automatic reduction to several government programs. This includes aggregate reductions of Medicare payments to providers of up to 2% per fiscal year, which went into effect on April 1, 2013.

It is likely that federal and state legislatures within the U.S. and foreign governments will continue to consider changes to existing healthcare legislation. We cannot predict the reform initiatives that may be adopted in the future or whether initiatives that have been adopted will be repealed or modified. The continuing efforts of the government, insurance companies, managed care organizations and other payors of healthcare services to contain or reduce costs of healthcare may adversely affect:

- the demand for any products that may be approved for sale;
- the price and profitability of our products;
- pricing, coverage and reimbursement applicable to our products;
- the ability to successfully position and market any approved product; and
- the taxes applicable to our pharmaceutical product revenues.

Some of the provisions of the PPACA have yet to be fully implemented, while certain provisions have been subject to judicial and Congressional challenges. In January 2017, Congress voted to adopt a budget resolution for fiscal year 2017, that while not a law, is widely viewed as the first step toward the passage of legislation that would repeal certain aspects of the PPACA. Further, on January 20, 2017, President Trump signed an Executive Order directing federal agencies with authorities and responsibilities under the Affordable Care Act to waive, defer, grant exemptions from, or delay the implementation of any provision of the Affordable Care Act that would impose a fiscal burden on states or a cost, fee, tax, penalty or regulatory burden on individuals, healthcare providers, health insurers, or manufacturers of pharmaceuticals or medical devices. Congress also could consider subsequent legislation to replace elements of the Affordable Care Act that are repealed. Given these possibilities and others we may not anticipate, the full extent to which our business, results of operations and financial condition could be adversely affected by the recent proposed legislation and the Executive Order is uncertain. The implementation of cost containment measures or other healthcare reforms may prevent us from being able to generate revenue, attain profitability, or commercialize our drugs.

Furthermore, legislative and regulatory proposals have been made to expand post-approval requirements and restrict sales and promotional activities for pharmaceutical products. We cannot be sure whether additional legislative changes will be enacted, or whether FDA regulations, guidance or interpretations will be changed, or what the impact of such changes on the regulatory approvals of our product candidates, if any, may be. In addition, increased scrutiny by the U.S. Congress of the FDA's approval process may significantly delay or prevent regulatory approval, as well as subject us to more stringent product labeling and post-marketing testing and other requirements.

We may not be able to conduct, or contract others to conduct, animal testing in the future, which could harm our research and development activities.

Certain laws and regulations relating to drug development require us to test our product candidates on animals before initiating clinical trials involving humans. Animal testing activities have been the subject of controversy and adverse publicity. Animal rights groups and other organizations and individuals have attempted to stop animal testing activities by pressing for legislation and regulation in these areas and by disrupting these activities through protests and other means. To the extent the activities of these groups are successful, our research and development activities may be interrupted or delayed.

Our employees may engage in misconduct or other improper activities, including noncompliance with regulatory standards and requirements, which could result in significant liability for us and harm our reputation.

We are exposed to the risk of employee fraud or other misconduct, including intentional failure to:

- comply with FDA regulations or similar regulations of comparable foreign regulatory authorities;
- provide accurate information to the FDA or comparable foreign regulatory authorities;
- comply with manufacturing standards we have established;
- · comply with privacy laws protecting personal information;
- comply with federal and state healthcare fraud and abuse laws and regulations and similar laws and regulations established and enforced by comparable foreign regulatory authorities;
- comply with the FCPA and other anti-bribery laws;
- report financial information or data accurately;
- or disclose unauthorized activities to us.

Employee misconduct could also involve the improper use of information obtained in the course of clinical trials, which could result in regulatory sanctions, delays in clinical trials, or serious harm to our reputation. We have adopted a code of conduct for our directors, officers and employees, but it is not always possible to identify and deter employee misconduct. The precautions we take to detect and prevent this activity may not be effective in controlling unknown or unmanaged risks or losses or in protecting us from governmental investigations or other actions or lawsuits stemming from a failure to be in compliance with such laws or regulations. If any such actions are instituted against us, and we are not successful in defending ourselves or asserting our rights, those actions could harm our business, results of operations, financial condition and cash flows, including through the imposition of significant fines or other sanctions.

If we fail to comply with environmental, health and safety laws and regulations, we could become subject to fines or penalties or incur costs that could harm our business.

We are subject to numerous environmental, health and safety laws and regulations, including those governing laboratory procedures and the handling, use, storage, treatment and disposal of hazardous materials and wastes. Our operations involve the use of hazardous and flammable materials, including chemicals and biological materials. Our operations also produce hazardous waste products. We contract with third parties for the disposal of these materials and wastes. We cannot eliminate the risk of contamination or injury from these materials. In the event of contamination or injury resulting from our use of hazardous materials, we could be held liable for any resulting damages, and any liability could exceed our resources. We also could incur significant costs associated with civil or criminal fines and penalties for failure to comply with such laws and regulations. We do not maintain insurance for environmental liability or toxic tort claims that may be asserted against us in connection with our storage or disposal of biological, hazardous or radioactive materials.

In addition, we may incur substantial costs in order to comply with current or future environmental, health and safety laws and regulations applicable to our operations in the U.S. and foreign countries. These current or future laws and regulations may impair our research, development or manufacturing efforts. Our failure to comply with these laws and regulations also may result in substantial fines, penalties or other sanctions.

Risks Related to Our International Operations

We are establishing international operations and seeking approval to commercialize our product candidates outside of the U.S., in particular in China, and a number of risks associated with international operations could materially and adversely affect our business.

We expect to be subject to a number of risks related with our international operations, many of which may be beyond our control. These risks include:

- different regulatory requirements for drug approvals in foreign countries;
- different standards of care in various countries that could complicate the evaluation of our product candidates;
- different U.S. and foreign drug import and export rules;
- reduced protection for intellectual property rights in certain countries;

Table of Contents

- · changes in tariffs, trade barriers and regulatory requirements;
- different reimbursement systems and different competitive drugs indicated to treat the indications for which our product candidates are being developed;
- economic weakness, including inflation, or political instability in particular foreign economies and markets;
- · compliance with tax, employment, immigration and labor laws for employees living or traveling abroad;
- compliance with the FCPA, and other anti-corruption and anti-bribery laws;
- U.S. and foreign taxes, including withholding of payroll taxes;
- foreign currency fluctuations, which could result in increased operating costs and expenses and reduced revenues, and other
 obligations incident to doing business in another country;
- workforce uncertainty in countries where labor unrest is more common than in the U.S.;
- production shortages resulting from any events affecting raw material supply or manufacturing capabilities abroad;
- a reliance on CROs, clinical trial sites, principal investigators and other third parties that may be less experienced with clinical trials or have different methods of performing such clinical trials than we are used to in the U.S.;
- potential liability resulting from development work conducted by foreign distributors; and
- · business interruptions resulting from geopolitical actions, including war and terrorism, or natural disasters.

The pharmaceutical industry in China is highly regulated and such regulations are subject to change.

The pharmaceutical industry in China is subject to comprehensive government regulation and supervision, encompassing the approval, registration, manufacturing, packaging, licensing and marketing of new drugs. Refer to "Business - Government Regulation - Regulation in China" in our annual report on Form 10-K for the year ended December 31, 2018 for a discussion of the regulatory requirements that are applicable to our current and planned business activities in China. In recent years, the regulatory framework in China regarding the pharmaceutical industry has undergone significant changes, and we expect that it will continue to undergo significant changes. Any such changes or amendments may result in increased compliance costs on our business or cause delays in or prevent the successful development or commercialization of our product candidates in China. For example, the NMPA recently adopted the International Council for Harmonisation of Technical Requirements for Pharmaceuticals for Human Use guidelines, and accordingly imposed regulatory oversight earlier in our production process for roxadustat manufactured and sold in China. The change in regulatory starting material triggered an extension of the inspection to our contract manufacturer STA, which was successfully completed in October 2018. In addition, Chinese authorities have become increasingly vigilant in enforcing laws in the pharmaceutical industry, in some cases launching industry-wide investigations, oftentimes appearing to focus on foreign companies. The costs and time necessary to respond to an investigation can be material. Any failure by us or our partners to maintain compliance with applicable laws and regulations or obtain and maintain required licenses and permits may result in the suspension or termination of our business activities in China.

We plan to use our own manufacturing facilities in China to produce roxadustat API, roxadustat drug product, and FG-5200 corneal implants. As an organization, we have limited experience in the construction, licensure, and operation of a manufacturing plant, and accordingly we cannot assure you we will be able to meet regulatory requirements to operate our plant and to sell our products.*

We have two manufacturing facilities in China, with one located in Beijing and the other in Cangzhou, Hebei. However, as an organization, we have limited experience licensing and operating commercial manufacturing facilities.

We will be obligated to comply with continuing cGMP requirements and there can be no assurance that we will maintain all of the appropriate licenses required to manufacture our product candidates for clinical and commercial use in China. In addition, we and our product suppliers must continually spend time, money and effort in production, record-keeping and quality assurance and appropriate controls in order to ensure that any products manufactured in our facilities meet applicable specifications and other requirements for product safety, efficacy and quality and there can be no assurance that our efforts will continue to be successful in meeting these requirements.

Table of Contents

We would require separate approval for the manufacture of FG-5200. In addition, we may convert the existing manufacturing process of FG-5200 to a semi-automated process, which may require us to show that implants from our new manufacturing process are comparable to the implants from our existing manufacturing process. There can be no assurance that we will successfully receive licensure and maintain approval for the manufacture of FG-5200, either of which would be expected to delay or preclude our ability to develop FG-5200 in China and may materially adversely affect our business and operations and prospects in China.

Manufacturing facilities in China are subject to periodic unannounced inspections by the NMPA and other regulatory authorities. We expect to depend on these facilities for our product candidates and business operations in China. Natural disasters or other unanticipated catastrophic events, including power interruptions, water shortages, storms, fires, earthquakes, terrorist attacks, government appropriation of our facilities, and wars, could significantly impair our ability to operate our manufacturing facilities. Certain equipment, records and other materials located in these facilities would be difficult to replace or would require substantial replacement lead time that would impact our ability to successfully commercialize our product candidates in China. The occurrence of any such event could materially and adversely affect our business, financial condition, results of operations, cash flows and prospects.

In addition to manufacturing, we are responsible for pharmacovigilance, medical affairs, and management of the third-party distribution logistics for roxadustat in China. We have no experience in these areas as a company, and accordingly we cannot assure you we will be able to meet regulatory requirements or operate in these capacities successfully.

We are responsible for commercial manufacturing, pharmacovigilance, medical affairs, and management of the third-party distribution logistics for roxadustat commercial activities in China. While we have been increasing our staffing in these areas, as a company, we have no experience managing or operating these functions for a commercial product and there can be no guarantee that we will do so efficiently or effectively. Mistakes or delays in these areas could limit our ability to successfully commercialize roxadustat in China, could limit our eventual market penetration, sales and profitability, and could subject us to significant liability in China.

We and our collaboration partner in China, AstraZeneca, may experience difficulties in successfully generating sales of roxadustat in China.*

We and AstraZeneca have a profit sharing arrangement with respect to roxadustat in China and any difficulties we may experience in generating sales will affect our bottom line. Difficulties may be related to our ability to obtain reasonable pricing, reimbursement, hospital listing, and tendering, or other difficulties related to distribution, marketing, and sales efforts in China. Sales of roxadustat in China may be limited due to the complex nature of the healthcare system, low average personal income, pricing controls, still developing infrastructure and potentially rapid competition from other products. The government has committed to updating the National Reimbursement Drug List ("NRDL") in 2019. Previous updates to the NRDL occurred in 2017 and 2009. In addition, there were also NRDL price negotiations in 2018 for oncology drugs. Admission to the NRDL depends on a number of factors, including on-market experience, scale of patient adoption, physician endorsement, cost-effectiveness and budget impact. Given that roxadustat was approved at the end of 2018, we may or may not qualify for the NRDL update in 2019. In particular, if we are unable to obtain reimbursement for roxadustat through the 2019 update to the NRDL, we may have to wait a substantial period of time before the reimbursement drug list is updated again. Without government reimbursement, many patients will not be able to afford roxadustat, since private commercial health insurance is rare, and our business and operations could be adversely affected. Therefore reimbursement and obtaining hospital listing is critical to roxadustat's near-term commercial success in China.

The market for treatment of anemia in CKD in China is highly competitive.*

Although we have now received approval for roxadustat for the treatment of anemia caused by CKD in dialysis patients and non-dialysis patients in China, it faces intense competition in the market for treatment of anemia in CKD. Roxadustat would compete with ESAs, which are offered by established multinational pharmaceutical companies such as Kyowa Hakko Kirin China Pharmaceutical Co., Ltd., Roche and Chinese pharmaceutical companies such as 3SBio Inc. and Di'ao Group Chengdu Diao Jiuhong Pharmaceutical Factory. Many of these competitors have substantially greater name recognition, scientific, financial, and marketing resources, as well as established distribution capabilities. Many of our competitors have more resources to develop or acquire, and more experience in developing or acquiring, new products and in creating market awareness for those products. Many of these competitors have significantly more experience than we have in navigating the Chinese regulatory framework regarding the development, manufacturing and marketing of drugs in China, as well as in marketing and selling anemia products in China. Additionally, we believe that most patients with anemia in CKD in China are currently being treated with traditional Chinese medicine, which is widely accepted and highly prevalent in China. Traditional Chinese medicine treatments are often oral and thus convenient and low-cost, and practitioners of traditional Chinese medicine are numerous and accessible in China. As a result, it may be difficult to persuade patients with anemia in CKD to switch from traditional Chinese medicine to roxadustat.

Table of Contents

The Chinese government is implementing a new "Two Invoices" regulation which could affect the way we structure our distributorship relationships in China for roxadustat.

The Chinese government is implementing new regulations that impact distribution of pharmaceutical products in China. These regulations generally require that at most two invoices may be issued throughout the distribution chain. Failure to comply with the "Two-Invoices" regulations would prevent us from accessing the market in China. We are planning on modifying the distribution responsibilities under the China Agreement between AstraZeneca and FibroGen such that FibroGen would engage distributors and a third-party logistics provider, and both companies will work together to manage the distribution network. FibroGen China Anemia Holdings, Ltd ("FibroGen China") has never managed distribution of pharmaceutical products, and this new distribution structure may impose higher costs or limit or delay our ability to sell products to our principal customers, and may limit the near term sales of our products.

There is no assurance that roxadustat will be included in the Medical Insurance Catalogs.

Eligible participants in the national basic medical insurance program in China, which consists of mostly urban residents, are entitled to reimbursement from the social medical insurance fund for up to the entire cost of medicines that are included in the Medical Insurance Catalogs. Refer to "Business - Government Regulation - Regulation in China" in our annual report on Form 10-K for the year ended December 31, 2018. We believe that the inclusion of a drug in the Medical Insurance Catalogs can substantially improve the sales of a drug in China. The Ministry of Labor and Social Security in China ("MLSS") together with other government authorities, select medicines to be included in the Medical Insurance Catalogs based on a variety of factors, including treatment requirements, frequency of use, effectiveness and price. The MLSS also occasionally removes medicines from such catalogs. There can be no assurance that roxadustat will be included, and once included, remain in the Medical Insurance Catalogs. The exclusion or removal of roxadustat from the Medical Insurance Catalogs may materially and adversely affect sales of roxadustat.

Even if FG-5200 can be manufactured successfully and achieve regulatory approval, we may not achieve commercial success.

We have not yet received a license to manufacture FG-5200 in our Beijing manufacturing facility or at scale, and we will have to show that FG-5200 produced in our China manufacturing facility meets the applicable regulatory requirements. There can be no assurance that we can meet these requirements or that FG-5200 can be approved for development, manufacture and sale in China.

Even if we are able to manufacture and develop FG-5200 as a medical device in China, the size and length of any potential clinical trials required for approval are uncertain and we are unable to predict the time and investment required to obtain regulatory approval. Moreover, even if FG-5200 can be successfully developed for approval in China, our product candidate would require extensive training and investment in assisting physicians in the use of FG-5200.

The retail prices of any product candidates that we develop may be subject to control, including periodic downward adjustment, by Chinese government authorities.

The price for pharmaceutical products is highly regulated in China, both at the national and provincial level. Price controls may reduce prices to levels significantly below those that would prevail in less regulated markets or limit the volume of products that may be sold, either of which may have a material and adverse effect on potential revenues from sales of roxadustat in China. Moreover, the process and timing for the implementation of price restrictions is unpredictable, which may cause potential revenues from the sales of roxadustat to fluctuate from period to period.

If our planned business activities in China fall within a restricted category under the China Catalog for Guidance for Foreign Investment, we will need to operate in China through a variable interest entity ("VIE") structure.

The China Catalog for Guidance for Foreign Investment sets forth the industries and sectors that the Chinese government encourages and restricts with respect to foreign investment and participation. The Catalog for Guidance for Foreign Investment is subject to revision from time to time by the China Ministry of Commerce. While we currently do not believe the development and marketing of roxadustat falls within a restricted category under the Catalog for Guidance for Foreign Investment, if roxadustat does fall under such a restricted category, we will need to operate in China through a VIE structure. A VIE structure involves a wholly foreign-owned enterprise that would control and receive the economic benefits of a domestic Chinese company through various contractual relationships. Such a structure would subject us to a number of risks that may have an adverse effect on our business, including that the Chinese government may determine that such contractual arrangements do not comply with applicable regulations, Chinese tax authorities may require us to pay additional taxes, shareholders of our VIEs may have potential conflicts of interest with us, and we may lose the ability to use and enjoy assets held by our VIEs that are important to the operations of our business if such entities go bankrupt or become subject to dissolution or liquidation proceedings. VIE structures in China have come under increasing scrutiny from accounting firms and the Securities and Exchange Commission ("SEC") staff. If we do attempt to use a VIE structure and are unsuccessful in structuring it so as to qualify as a VIE, we would not be able to consolidate the financial statements of the VIE with our financial statements, which could have a material adverse effect on our operating results and financial condition.

FibroGen Beijing would be subject to restrictions on paying dividends or making other payments to us, which may restrict our ability to satisfy our liquidity requirements.*

We plan to conduct all of our business in China through FibroGen China and FibroGen Beijing. We may rely on dividends and royalties paid by FibroGen Beijing for a portion of our cash needs, including the funds necessary to service any debt we may incur and to pay our operating costs and expenses. The payment of dividends by FibroGen Beijing is subject to limitations. Regulations in China currently permit payment of dividends only out of accumulated profits as determined in accordance with accounting standards and regulations in China. FibroGen Beijing is not permitted to distribute any profits until losses from prior fiscal years have been recouped and in any event must maintain certain minimum capital requirements. FibroGen Beijing is also required to set aside at least 10.0% of its after-tax profit based on Chinese accounting standards each year to its statutory reserve fund until the cumulative amount of such reserves reaches 50.0% of its registered capital. Statutory reserves are not distributable as cash dividends. In addition, if FibroGen Beijing incurs debt on its own behalf in the future, the agreements governing such debt may restrict its ability to pay dividends or make other distributions to us. As of September 30, 2019, approximately \$6.9 million of our cash and cash equivalents is held in China.

Any capital contributions from us to FibroGen Beijing must be approved by the Ministry of Commerce in China, and failure to obtain such approval may materially and adversely affect the liquidity position of FibroGen Beijing.

The Ministry of Commerce in China or its local counterpart must approve the amount and use of any capital contributions from us to FibroGen Beijing, and there can be no assurance that we will be able to complete the necessary government registrations and obtain the necessary government approvals on a timely basis, or at all. If we fail to do so, we may not be able to contribute additional capital to fund our Chinese operations, and the liquidity and financial position of FibroGen Beijing may be materially and adversely affected.

We may be subject to currency exchange rate fluctuations and currency exchange restrictions with respect to our operations in China, which could adversely affect our financial performance.*

Most of our product sales will occur in local Chinese currency and our operating results will be subject to volatility from currency exchange rate fluctuations. To date, we have not hedged against the risks associated with fluctuations in exchange rates and, therefore, exchange rate fluctuations could have an adverse impact on our future operating results. Changes in value of the Renminbi against the U.S. dollar, Euro and other currencies is affected by, among other things, changes in China's political and economic conditions. Currently, the Renminbi is permitted to fluctuate within a narrow and managed band against a basket of certain foreign currencies. Any significant currency exchange rate fluctuations may have a material adverse effect on our business and financial condition.

Table of Contents

In addition, the Chinese government imposes controls on the convertibility of the Renminbi into foreign currencies and the remittance of foreign currency out of China for certain transactions. Shortages in the availability of foreign currency may restrict the ability of FibroGen Beijing to remit sufficient foreign currency to pay dividends or other payments to us, or otherwise satisfy their foreign currency-denominated obligations. Under existing Chinese foreign exchange regulations, payments of current account items, including profit distributions, interest payments and balance of trade, can be made in foreign currencies without prior approval from the State Administration of Foreign Exchange ("SAFE") by complying with certain procedural requirements. However, approval from SAFE or its local branch is required where Renminbi is to be converted into foreign currency and remitted out of China to pay capital expenses such as the repayment of loans denominated in foreign currencies. The Chinese government may also at its discretion restrict access in the future to foreign currencies for current account transactions. If the foreign exchange control system prevents us from obtaining sufficient foreign currency to satisfy our operational requirements, our liquidity and financial position may be materially and adversely affected.

Because FibroGen Beijing's funds are held in banks that do not provide insurance, the failure of any bank in which FibroGen Beijing deposits its funds could adversely affect our business.

Banks and other financial institutions in China do not provide insurance for funds held on deposit. As a result, in the event of a bank failure, FibroGen Beijing may not have access to funds on deposit. Depending upon the amount of money FibroGen Beijing maintains in a bank that fails, its inability to have access to cash could materially impair its operations.

We may be subject to tax inefficiencies associated with our offshore corporate structure.*

The tax regulations of the U.S. and other jurisdictions in which we operate are extremely complex and subject to change. New laws, new interpretations of existing laws, such as the Base Erosion Profit Shifting project initiated by the Organization for Economic Co-operation and Development, and any legislation proposed by the relevant taxing authorities, or limitations on our ability to structure our operations and intercompany transactions may lead to inefficient tax treatment of our revenue, profits, royalties, and distributions, if any are achieved.

In addition, we and our foreign subsidiaries have various intercompany transactions. We may not be able to obtain certain benefits under relevant tax treaties to avoid double taxation on certain transactions among our subsidiaries. If we are not able to avail ourselves to the tax treaties, we could be subject to additional taxes, which could adversely affect our financial condition and results of operations.

On December 22, 2017, the U.S. enacted the Tax Cuts and Jobs Act ("Tax Act") that instituted fundamental changes to the taxation of multinational corporations. The Tax Act includes changes to the taxation of foreign earnings by implementing a dividend exemption system, expansion of the current anti-deferral rules, a minimum tax on low-taxed foreign earnings and new measures to deter base erosion. The Tax Act also includes a permanent reduction in the corporate tax rate to 21%, repeal of the corporate alternative minimum tax, expensing of capital investment, and limitation of the deduction for interest expense. Furthermore, as part of the transition to the new tax system, a one-time transition tax is imposed on a U.S. shareholder's historical undistributed earnings of foreign affiliates. There have been developing interpretations of the provisions of the Tax Act, including changes and issuance of new U.S. Treasury regulations, administrative interpretations, or court decisions since its inception. As regulations and guidance evolve with respect to the Tax Act, we continue to examine the impact to our business, which could have a material adverse effect on our business, results of operations or financial condition.

Our foreign operations, particularly those in China, are subject to significant risks involving the protection of intellectual property.

We seek to protect the products and technology that we consider important to our business by pursuing patent applications in China and other countries, relying on trade secrets or pharmaceutical regulatory protection or employing a combination of these methods. We note that the filing of a patent application does not mean that we will be granted a patent, or that any patent eventually granted will be as broad as requested in the patent application or will be sufficient to protect our technology. There are a number of factors that could cause our patents, if granted, to become invalid or unenforceable or that could cause our patent applications not to be granted, including known or unknown prior art, deficiencies in the patent application, or lack of originality of the technology. Furthermore, the terms of our patents are limited. The patents we hold and the patents that may be granted from our currently pending patent applications have, absent any patent term adjustment or extension, a twenty-year protection period starting from the date of application.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 193 of 1730

Table of Contents

Intellectual property rights and confidentiality protections in China may not be as effective as those in the U.S. or other countries for many reasons, including lack of procedural rules for discovery and evidence, low damage awards, and lack of judicial independence. Implementation and enforcement of China intellectual property laws have historically been deficient and ineffective and may be hampered by corruption and local protectionism. Policing unauthorized use of proprietary technology is difficult and expensive, and we may need to resort to litigation to enforce or defend patents issued to us or to determine the enforceability and validity of our proprietary rights or those of others. The experience and capabilities of China courts in handling intellectual property litigation varies and outcomes are unpredictable. An adverse determination in any such litigation could materially impair our intellectual property rights and may harm our business.

We are subject to laws and regulations governing corruption, which will require us to develop, maintain, and implement costly compliance programs.

We must comply with a wide range of laws and regulations to prevent corruption, bribery, and other unethical business practices, including the FCPA, anti-bribery and anti-corruption laws in other countries, particularly China. The creation and implementation of international business practices compliance programs is costly and such programs are difficult to enforce, particularly where reliance on third parties is required.

Anti-bribery laws prohibit us, our employees, and some of our agents or representatives from offering or providing any personal benefit to covered government officials to influence their performance of their duties or induce them to serve interests other than the missions of the public organizations in which they serve. Certain commercial bribery rules also prohibit offering or providing any personal benefit to employees and representatives of commercial companies to influence their performance of their duties or induce them to serve interests other than their employers. The FCPA also obligates companies whose securities are listed in the U.S. to comply with certain accounting provisions requiring us to maintain books and records that accurately and fairly reflect all transactions of the corporation, including international subsidiaries, and devise and maintain an adequate system of internal accounting controls for international operations. The anti-bribery provisions of the FCPA are enforced primarily by the Department of Justice. The SEC is involved with enforcement of the books and records provisions of the FCPA.

Compliance with these anti-bribery laws is expensive and difficult, particularly in countries in which corruption is a recognized problem. In addition, the anti-bribery laws present particular challenges in the pharmaceutical industry because in many countries including China, hospitals are state-owned or operated by the government, and doctors and other hospital employees are considered foreign government officials. Furthermore, in certain countries (China in particular), hospitals and clinics are permitted to sell pharmaceuticals to their patients and are primary or significant distributors of pharmaceuticals. Certain payments to hospitals in connection with clinical studies, procurement of pharmaceuticals and other work have been deemed to be improper payments to government officials that have led to vigorous anti-bribery law enforcement actions and heavy fines in multiple jurisdictions, particularly in the U.S. and China.

It is not always possible to identify and deter violations, and the precautions we take to detect and prevent this activity may not be effective in controlling unknown or unmanaged risks or losses or in protecting us from governmental investigations or other actions or lawsuits stemming from a failure to be in compliance with such laws or regulations.

In the pharmaceutical industry, corrupt practices include, among others, acceptance of kickbacks, bribes or other illegal gains or benefits by the hospitals and medical practitioners from pharmaceutical manufacturers, distributors or their third-party agents in connection with the prescription of certain pharmaceuticals. If our employees, affiliates, distributors or third-party marketing firms violate these laws or otherwise engage in illegal practices with respect to their sales or marketing of our products or other activities involving our products, we could be required to pay damages or heavy fines by multiple jurisdictions where we operate, which could materially and adversely affect our financial condition and results of operations. The Chinese government has also sponsored anti-corruption campaigns from time to time, which could have a chilling effect on any future marketing efforts by us to new hospital customers. There have been recent occurrences in which certain hospitals have denied access to sales representatives from pharmaceutical companies because the hospitals wanted to avoid the perception of corruption. If this attitude becomes widespread among our potential customers, our ability to promote our products to hospitals may be adversely affected.

Table of Contents

As we expand our operations in China and other jurisdictions internationally, we will need to increase the scope of our compliance programs to address the risks relating to the potential for violations of the FCPA and other anti-bribery and anti-corruption laws. Our compliance programs will need to include policies addressing not only the FCPA, but also the provisions of a variety of anti-bribery and anti-corruption laws in multiple foreign jurisdictions, including China, provisions relating to books and records that apply to us as a public company, and include effective training for our personnel throughout our organization. The creation and implementation of anti-corruption compliance programs is costly and such programs are difficult to enforce, particularly where reliance on third parties is required. Violation of the FCPA and other anti-corruption laws can result in significant administrative and criminal penalties for us and our employees, including substantial fines, suspension or debarment from government contracting, prison sentences, or even the death penalty in extremely serious cases in certain countries. The SEC also may suspend or bar us from trading securities on U.S. exchanges for violation of the FCPA's accounting provisions. Even if we are not ultimately punished by government authorities, the costs of investigation and review, distraction of our personnel, legal defense costs, and harm to our reputation could be substantial and could limit our profitability or our ability to develop or commercialize our product candidates. In addition, if any of our competitors are not subject to the FCPA, they may engage in practices that will lead to their receipt of preferential treatment from foreign hospitals and enable them to secure business from foreign hospitals in ways that are unavailable to us.

Uncertainties with respect to the China legal system could have a material adverse effect on us.

The legal system of China is a civil law system primarily based on written statutes. Unlike in a common law system, prior court decisions may be cited for reference but are not binding. Because the China legal system continues to rapidly evolve, the interpretations of many laws, regulations and rules are not always uniform and enforcement of these laws, regulations and rules involve uncertainties, which may limit legal protections available to us. Moreover, decision makers in the China judicial system have significant discretion in interpreting and implementing statutory and contractual terms, which may render it difficult for FibroGen Beijing to enforce the contracts it has entered into with our business partners, customers and suppliers. Different government departments may have different interpretations of certain laws and regulations, and licenses and permits issued or granted by one government authority may be revoked by a higher government authority at a later time. Navigating the uncertainty and change in the China legal system will require the devotion of significant resources and time, and there can be no assurance that our contractual and other rights will ultimately be enforced.

Changes in China's economic, political or social conditions or government policies could have a material adverse effect on our business and operations.*

Chinese society and the Chinese economy continue to undergo significant change. Changes in the regulatory structure, regulations, and economic policies of the Chinese government could have a material adverse effect on the overall economic growth of China, which could adversely affect our ability to conduct business in China. The Chinese government continues to adjust economic policies to promote economic growth. Some of these measures benefit the overall Chinese economy, but may also have a negative effect on us. For example, our financial condition and results of operations in China may be adversely affected by government control over capital investments or changes in tax regulations. As the Chinese pharmaceutical industry grows and evolves, the Chinese government may also implement measures to change the regulatory structure and structure of foreign investment in this industry. We are unable to predict the frequency and scope of such policy changes and structural changes, any of which could materially and adversely affect FibroGen Beijing's development and commercialization timelines, liquidity, access to capital, and its ability to conduct business in China. Any failure on our part to comply with changing government regulations and policies could result in the loss of our ability to develop and commercialize our product candidates in China. In addition, the changing government regulations and policies could result in delays and cost increases to our development, manufacturing, approval, and commercialization timelines in China.

Our operations in China subject us to various Chinese labor and social insurance laws, and our failure to comply with such laws may materially and adversely affect our business, financial condition and results of operations.

We are subject to China Labor Contract Law, which provides strong protections for employees and imposes many obligations on employers. The Labor Contract Law places certain restrictions on the circumstances under which employers may terminate labor contracts and require economic compensation to employees upon termination of employment, among other things. In addition, companies operating in China are generally required to contribute to labor union funds and the mandatory social insurance and housing funds. Any failure by us to comply with Chinese labor and social insurance laws may subject us to late fees, fines and penalties, or cause the suspension or termination of our ability to conduct business in China, any of which could have a material and adverse effect on business, results of operations and prospects.

Recent developments relating to the United Kingdom's referendum vote in favor of leaving the EU could adversely affect us.

The United Kingdom held a referendum on June 23, 2016 in which a majority voted for the United Kingdom's withdrawal from the EU, commonly referred to as "Brexit". As a result of this vote, negotiations are expected to commence to determine the terms of the United Kingdom's withdrawal from the EU as well as its relationship with the EU going forward, including the terms of trade between the United Kingdom and the EU. The effects of the United Kingdom's withdrawal from the EU, and the perceptions as to its impact, are expected to be far-reaching and may adversely affect business activity and economic conditions in Europe and globally and could continue to contribute to instability in global financial markets, including foreign exchange markets. The United Kingdom's withdrawal from the EU could also have the effect of disrupting the free movement of goods, services and people between the United Kingdom and the EU and could also lead to legal uncertainty and potentially divergent national laws and regulations as the United Kingdom determines which EU laws to replace or replicate, including laws that could impact our ability, or our collaborator's ability in the case of roxadustat, to obtain approval of our products or sell our products in the United Kingdom. However, the full effects of such withdrawal are uncertain and will depend on any agreements the United Kingdom may make to retain access to EU markets. Lastly, as a result of the United Kingdom's withdrawal from the EU, other European countries may seek to conduct referenda with respect to their continuing membership with the EU. Given these possibilities and others we may not anticipate, as well as the lack of comparable precedent, the full extent to which our business, results of operations and financial condition could be adversely affected by the United Kingdom's withdrawal from the EU is uncertain.

Risks Related to the Operation of Our Business

We may encounter difficulties in managing our growth and expanding our operations successfully.

As we seek to advance our product candidates through clinical trials and commercialization, we will need to expand our development, regulatory, manufacturing, commercialization and administration capabilities or contract with third parties to provide these capabilities for us. As our operations expand and we continue to undertake the efforts and expense to operate as a public reporting company, we expect that we will need to increase the responsibilities on members of management in order to manage any future growth effectively. Our failure to accomplish any of these steps could prevent us from successfully implementing our strategy and maintaining the confidence of investors in our Company.

Loss of senior management and key personnel, including the recent passing of our founder, chairman and chief executive officer, could adversely affect our ability to successfully develop our product candidates, conduct our clinical trials and commercialize our product candidates.*

We are highly dependent on members of our senior management team, in particular our chief executive officer. On August 26, 2019, we announced the passing of Thomas B. Neff, our founder, chairman and chief executive officer. It was concurrently announced that James Schoeneck, a longtime member of our Board of Directors, was appointed as interim chief executive officer and that the Board of Directors would pursue the search for a permanent chief executive officer. The transitions in our executive team over the next year or more may be disruptive to our operations. The loss of the services of Mr. Neff and the potential delay with finding a permanent CEO could significantly negatively impact the development and commercialization of our product candidates, our existing collaborative relationships, and our ability to successfully implement our business strategy.

Recruiting and retaining qualified commercial, development, scientific, clinical, and manufacturing personnel are and will continue to be critical to our success, particularly as we expand our commercialization operations. Furthermore, replacing executive officers and key employees may be difficult and may take an extended period of time because of the limited number of individuals in our industry with the breadth of skills and experience required to successfully develop, gain regulatory approval of and commercialize product candidates. We may be unable to hire, train, retain or motivate these key personnel on acceptable terms given the intense competition among numerous biopharmaceutical companies for similar personnel.

There is also significant competition, in particular in the San Francisco Bay Area, for the hiring of experienced and qualified personnel, which increases the importance of retention of our existing personnel. If we are unable to continue to attract and retain personnel with the quality and experience applicable to our product candidates, our ability to pursue our strategy will be limited and our business and operations would be adversely affected.

If product liability lawsuits are brought against us, we may incur substantial liabilities and may be required to limit commercialization of our product candidates.

We face an inherent risk of product liability as a result of the clinical testing, manufacturing and commercialization of our product candidates. Any such product liability claims may include allegations of defects in manufacturing, defects in design, a failure to warn of dangers inherent in a product, negligence, strict liability or breach of warranty. Claims could also be asserted under state consumer protection acts. If we are unable to obtain insurance coverage at levels that are appropriate to maintain our business and operations, or if we are unable to successfully defend ourselves against product liability claims, we may incur substantial liabilities or otherwise cease operations. Product liability claims may result in:

- · termination of further development of unapproved product candidates or significantly reduced demand for any approved products;
- material costs and expenses to defend the related litigation;
- a diversion of time and resources across the entire organization, including our executive management;
- product recalls, withdrawals or labeling restrictions;
- · termination of our collaboration relationships or disputes with our collaboration partners; and
- · reputational damage negatively impacting our other product candidates in development.

If we fail to obtain and retain sufficient product liability insurance at an acceptable cost to protect against potential product liability claims, we may not be able to continue to develop our product candidates. We maintain product liability insurance in a customary amount for the stage of development of our product candidates. Although we believe that we have sufficient coverage based on the advice of our third-party advisors, there can be no assurance that such levels will be sufficient for our needs. Moreover, our insurance policies have various exclusions, and we may be in a dispute with our carrier as to the extent and nature of our coverage, including whether we are covered under the applicable product liability policy. If we are not able to ensure coverage or are required to pay substantial amounts to settle or otherwise contest the claims for product liability, our business and operations would be negatively affected.

Our business and operations would suffer in the event of computer system failures.

Despite the implementation of security measures, our internal computer systems, and those of our CROs, collaboration partners, and other third parties on which we rely, are vulnerable to damage from computer viruses, unauthorized access, natural disasters, fire, terrorism, war and telecommunication and electrical failures. We upgraded our disaster and data recovery capabilities in June 2017, however, to the extent that any disruption or security breach, in particular with our partners' operations, results in a loss of, or damage to, our data or applications, or inappropriate disclosure of confidential or proprietary information, we could incur liability and it could result in a material disruption and delay of our drug development programs. For example, the loss of clinical trial data from completed, ongoing or planned clinical trials could result in delays in our regulatory approval efforts and significantly increase our costs to recover or reproduce the data.

We depend on sophisticated information technology systems to operate our business and a cyber-attack or other breach of these systems could have a material adverse effect on our business.

We rely on information technology systems to process, transmit and store electronic information in our day-to-day operations. The size and complexity of our information technology systems makes them vulnerable to a cyber-attack, malicious intrusion, breakdown, destruction, loss of data privacy or other significant disruption. While we have recently upgraded our disaster data recovery program, a successful attack could result in the theft or destruction of intellectual property, data, or other misappropriation of assets, or otherwise compromise our confidential or proprietary information and disrupt our operations. Cyber-attacks are becoming more sophisticated and frequent. We have invested in our systems and the protection and recoverability of our data to reduce the risk of an intrusion or interruption, and we monitor and test our systems on an ongoing basis for any current or potential threats. There can be no assurance that these measures and efforts will prevent future interruptions or breakdowns. If we fail to maintain or protect our information technology systems and data integrity effectively or fail to anticipate, plan for or manage significant disruptions to these systems, we could have difficulty preventing, detecting and controlling such cyber-attacks and any such attacks could result in losses described above as well as disputes with physicians, patients and our partners, regulatory sanctions or penalties, increases in operating costs and expenses, expenses or lost revenues or other adverse consequences, any of which could have a material adverse effect on our business, results of operations, financial condition, prospects and cash flows.

Our headquarters and data storage facilities are located near known earthquake fault zones. The occurrence of an earthquake, fire or any other catastrophic event could disrupt our operations or the operations of third parties who provide vital support functions to us, which could have a material adverse effect on our business, results of operations and financial condition.

We and some of the third-party service providers on which we depend for various support functions, such as data storage, are vulnerable to damage from catastrophic events, such as power loss, natural disasters, terrorism and similar unforeseen events beyond our control. Our corporate headquarters and other facilities are located in the San Francisco Bay Area, which in the past has experienced severe earthquakes and fires.

We do not carry earthquake insurance. Earthquakes or other natural disasters could severely disrupt our operations, and have a material adverse effect on our business, results of operations, financial condition and prospects.

If a natural disaster, power outage or other event occurred that prevented us from using all or a significant portion of our headquarters, damaged critical infrastructure, or otherwise disrupted operations, it may be difficult or, in certain cases, impossible for us to continue our business for a substantial period of time. The disaster recovery and business continuity plans we have in place are unlikely to provide adequate protection in the event of a serious disaster or similar event. We may incur substantial expenses as a result of the limited nature of our disaster recovery and business continuity plans, which, particularly when taken together with our lack of earthquake insurance, could have a material adverse effect on our business.

Furthermore, integral parties in our supply chain are operating from single sites, increasing their vulnerability to natural disasters or other sudden, unforeseen and severe adverse events. If such an event were to affect our supply chain, it could have a material adverse effect on our business.

Risks Related to Our Common Stock

The market price of our common stock may be highly volatile, and you may not be able to resell your shares at or above your purchase price.

In general, pharmaceutical, biotechnology and other life sciences company stocks have been highly volatile in the current market. The volatility of pharmaceutical, biotechnology and other life sciences company stocks is sometimes unrelated to the operating performance of particular companies and biotechnology and life science companies stocks often respond to trends and perceptions rather than financial performance. In particular, the market price of shares of our common stock could be subject to wide fluctuations in response to the following factors:

- results of clinical trials of our product candidates, including roxadustat and pamrevlumab;
- the timing of the release of results of and regulatory updates regarding our clinical trials;
- the level of expenses related to any of our product candidates or clinical development programs;
- · results of clinical trials of our competitors' products;
- safety issues with respect to our product candidates or our competitors' products;
- regulatory actions with respect to our product candidates and any approved products or our competitors' products;
- fluctuations in our financial condition and operating results, which will be significantly affected by the manner in which we recognize revenue from the achievement of milestones under our collaboration agreements;
- adverse developments concerning our collaborations and our manufacturers;
- the termination of a collaboration or the inability to establish additional collaborations;
- the publication of research reports by securities analysts about us or our competitors or our industry or negative recommendations or withdrawal of research coverage by securities analysts;
- · the inability to obtain adequate product supply for any approved drug product or inability to do so at acceptable prices;
- disputes or other developments relating to proprietary rights, including patents, litigation matters and our ability to obtain patent protection for our technologies;
- the ineffectiveness of our internal controls;
- our failure or the failure of our competitors to meet analysts' projections or guidance that we or our competitors may give to the market;

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 198 of 1730

Table of Contents

- additions and departures of key personnel;
- announced strategic decisions by us or our competitors;
- changes in legislation or other regulatory developments affecting our product candidates or our industry;
- · fluctuations in the valuation of the biotechnology industry and particular companies perceived by investors to be comparable to us;
- sales of our common stock by us, our insiders or our other stockholders;
- · speculation in the press or investment community;
- announcement or expectation of additional financing efforts;
- announcements of investigations or regulatory scrutiny of our operations or lawsuits filed against us;
- changes in accounting principles;
- · activities of the government of China, including those related to the pharmaceutical industry as well as industrial policy generally;
- performance of other U.S. publicly traded companies with significant operations in China;
- terrorist acts, acts of war or periods of widespread civil unrest;
- natural disasters such as earthquakes and other calamities;
- changes in market conditions for biopharmaceutical stocks;
- changes in general market and economic conditions; and
- the other factors described in this "Risk Factors" section.

As a result of fluctuations caused by these and other factors, comparisons of our operating results across different periods may not be accurate indicators of our future performance. Any fluctuations that we report in the future may differ from the expectations of market analysts and investors, which could cause the price of our common stock to fluctuate significantly. Moreover, securities class action litigation has often been initiated against companies following periods of volatility in their stock price. This type of litigation could result in substantial costs and divert our management's attention and resources and could also require us to make substantial payments to satisfy judgments or to settle litigation.

We have broad discretion in the use of the remaining net proceeds from our underwritten public offerings of common stock completed on April 11, 2017 (the "April 2017 Offering") and August 24, 2017 (the "August 2017 Offering") and may not use them effectively.

The net proceeds from the April 2017 Offering is intended to be used to fund the expansion of product development in China, including developing roxadustat in additional indications beyond CKD, manufacturing and commercialization activities, as well as for general corporate purposes. The net proceeds from the August 2017 Offering is intended to be used to fund the expansion of product development, including our development of pamrevlumab through Phase 3 trials, manufacturing and commercialization activities, as well as for general corporate purposes. These general corporate purposes, may include, among other things, funding research and development, clinical trials, vendor payables, potential regulatory submissions, hiring additional personnel and capital expenditures. However, we have no current commitments or obligations to use the net proceeds in the manner described above. Our management has broad discretion in the application of the remaining net proceeds from the April 2017 Offering and the August 2017 Offering, and could spend the remaining net proceeds in ways our stockholders may not agree with or that fails to improve our business or enhance the value of our common stock. The failure by our management to use these funds effectively could result in financial losses that could harm our business, cause the price of our common stock to decline and delay the development of our product candidates.

If securities or industry analysts do not continue to publish research or reports about our business, or if they change their recommendations regarding our stock adversely, our stock price and trading volume could decline.

The trading market for our common stock will be influenced by the research and reports that industry or securities analysts publish about us or our business. If one or more of the analysts who cover us downgrade our stock, our stock price would likely decline. If one or more of these analysts cease coverage of our Company or fail to regularly publish reports on us, we could lose visibility in the financial markets, which in turn could cause our stock price or trading volume to decline.

Our principal stockholders and management own a significant percentage of our stock and will be able to exercise significant influence over matters subject to stockholder approval.*

As of October 31, 2019, our executive officers, directors and principal stockholders, together with their respective affiliates, owned approximately 28.00% of our common stock, including shares subject to outstanding options that are exercisable within 60 days after such date and shares issuable upon settlement of restricted stock units that will vest within 60 days after such date. This percentage is based upon information supplied by officers, directors and principal stockholders and Schedules 13D and 13G, if any, filed with the SEC, which information may not be accurate as of April 30, 2019. Accordingly, these stockholders will be able to exert a significant degree of influence over our management and affairs and over matters requiring stockholder approval, including the election of our board of directors and approval of significant corporate transactions. The interests of this group may differ from those of other stockholders and they may vote their shares in a way that is contrary to the way other stockholders vote their shares. This concentration of ownership could have the effect of entrenching our management and/or the board of directors, delaying or preventing a change in our control or otherwise discouraging a potential acquirer from attempting to obtain control of us, which in turn could have a material and adverse effect on the fair market value of our common stock.

Additional remedial measures that may be imposed in the proceedings instituted by the SEC against five China based accounting firms, including the Chinese affiliate of our independent registered public accounting firm, could result in our consolidated financial statements being determined to not be in compliance with the requirements of the Exchange Act.

In late 2012, the SEC commenced administrative proceedings under Rule 102(e) of its Rules of Practice and also under the Sarbanes-Oxley Act of 2002 against the Chinese affiliates of the "big four" accounting firms, including PricewaterhouseCoopers Zhong Tian CPAs Limited, the Chinese affiliate of our independent registered public accounting firm. The Rule 102(e) proceedings initiated by the SEC relate to these firms' failure to produce documents, including audit work papers, in response to the request of the SEC pursuant to Section 106 of the Sarbanes-Oxley Act of 2002, as the auditors located in China are not in a position lawfully to produce documents directly to the SEC because of restrictions under Chinese law and specific directives issued by the China Securities Regulatory Commission ("CSRC"). The issues raised by the proceedings are not specific to our auditors or to us.

In January 2014, an administrative law judge reached an initial decision that the Chinese affiliates of the "big four" accounting firms should be barred from practicing before the SEC for a period of six months. In February 2015, the Chinese affiliates of the "big four" accounting firms each agreed to a censure and to pay a fine to the SEC to settle the dispute and avoid suspension of their ability to practice before the SEC and audit U.S.-listed companies. The settlement required the firms to follow detailed procedures and to seek to provide the SEC with access to Chinese firms' audit documents via the CSRC. If future document productions fail to meet specified criteria, the SEC retains authority to impose a variety of additional remedial measures on the firms depending on the nature of the failure.

We cannot predict if the SEC will further review the four firms' compliance with specified criteria or if such further review would result in the SEC imposing additional penalties such as suspensions or commencing any further administrative proceedings. Although it does not play a substantial role (as defined under PCAOB standards) in the audit of our consolidated financial statements, if PricewaterhouseCoopers Zhong Tian CPAs Limited were denied, temporarily, the ability to practice before the SEC, our ability to produce audited consolidated financial statements for our Company could be affected and we could be determined not to be in compliance with the requirements of the Exchange Act. Such a determination could ultimately lead to the delisting of our shares from the Nasdaq Global Select Market or deregistration from the SEC, or both, which would substantially reduce or effectively terminate the trading of our stock.

We may engage in future acquisitions that could disrupt our business, cause dilution to our stockholders and harm our business, results of operations, financial condition and cash flows and future prospects.

While we currently have no specific plans to acquire any other businesses, we may, in the future, make acquisitions of, or investments in, companies that we believe have products or capabilities that are a strategic or commercial fit with our present or future product candidates and business or otherwise offer opportunities for our Company. In connection with these acquisitions or investments, we may:

- issue stock that would dilute our existing stockholders' percentage of ownership;
- · incur debt and assume liabilities; and
- incur amortization expenses related to intangible assets or incur large and immediate write-offs.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 200 of 1730

Table of Contents

We may not be able to complete acquisitions on favorable terms, if at all. If we do complete an acquisition, we cannot assure you that it will ultimately strengthen our competitive position or that it will be viewed positively by customers, financial markets or investors. Furthermore, future acquisitions could pose numerous additional risks to our operations, including:

- · problems integrating the purchased business, products or technologies, or employees or other assets of the acquisition target;
- · increases to our expenses;
- disclosed or undisclosed liabilities of the acquired asset or company;
- diversion of management's attention from their day-to-day responsibilities;
- reprioritization of our development programs and even cessation of development and commercialization of our current product candidates;
- · harm to our operating results or financial condition;
- entrance into markets in which we have limited or no prior experience; and
- potential loss of key employees, particularly those of the acquired entity.

We may not be able to complete any acquisitions or effectively integrate the operations, products or personnel gained through any such acquisition.

Provisions in our charter documents and Delaware law may have anti-takeover effects that could discourage an acquisition of us by others, even if an acquisition would be beneficial to our stockholders, and may prevent attempts by our stockholders to replace or remove our current directors or management.

Provisions in our amended and restated certificate of incorporation and amended and restated bylaws contain provisions that may have the effect of discouraging, delaying or preventing a change in control of us or changes in our management. These provisions could also limit the price that investors might be willing to pay in the future for shares of our common stock, thereby depressing the market price of our common stock. In addition, because our board of directors is responsible for appointing the members of our management team, these provisions may frustrate or prevent any attempts by our stockholders to replace or remove our current management by making it more difficult for stockholders to replace members of our board of directors. Among other things, these provisions:

- authorize "blank check" preferred stock, which could be issued by our board of directors without stockholder approval and may contain voting, liquidation, dividend and other rights superior to our common stock;
- create a classified board of directors whose members serve staggered three-year terms;
- specify that special meetings of our stockholders can be called only by our board of directors pursuant to a resolution adopted by a
 majority of the total number of directors;
- · prohibit stockholder action by written consent;
- establish an advance notice procedure for stockholder approvals to be brought before an annual meeting of our stockholders, including proposed nominations of persons for election to our board of directors;
- provide that our directors may be removed prior to the end of their term only for cause;
- provide that vacancies on our board of directors may be filled only by a majority of directors then in office, even though less than a
 quorum;
- require a supermajority vote of the holders of our common stock or the majority vote of our board of directors to amend our bylaws;
 and
- require a supermajority vote of the holders of our common stock to amend the classification of our board of directors into three classes and to amend certain other provisions of our certificate of incorporation.

These provisions, alone or together, could delay or prevent hostile takeovers and changes in control or changes in our management by making it more difficult for stockholders to replace members of our board of directors, which is responsible for appointing the members of our management.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 201 of 1730

Table of Contents

Moreover, because we are incorporated in Delaware, we are governed by certain anti-takeover provisions under Delaware law which may discourage, delay or prevent someone from acquiring us or merging with us whether or not it is desired by or beneficial to our stockholders. We are subject to the provisions of Section 203 of the Delaware General Corporation Law, which prohibits a person who owns in excess of 15% of our outstanding voting stock from merging or combining with us for a period of three years after the date of the transaction in which the person acquired in excess of 15% of our outstanding voting stock, unless the merger or combination is approved in a prescribed manner.

Any provision of our amended and restated certificate of incorporation, our amended and restated bylaws or Delaware law that has the effect of delaying or deterring a change in control could limit the opportunity for our stockholders to receive a premium for their shares of our common stock, and could also affect the price that some investors are willing to pay for our common stock.

Changes in our tax provision or exposure to additional tax liabilities could adversely affect our earnings and financial condition.*

As a multinational corporation, we are subject to income taxes in the U.S. and various foreign jurisdictions. Significant judgment is required in determining our global provision for income taxes and other tax liabilities. In the ordinary course of a global business, there are intercompany transactions and calculations where the ultimate tax determination is uncertain. Our income tax returns are subject to audits by tax authorities. Although we regularly assess the likelihood of adverse outcomes resulting from these examinations to determine our tax estimates, a final determination of tax audits or tax disputes could have an adverse effect on our results of operations and financial condition.

We are also subject to non-income taxes, such as payroll, sales, use, value-added, net worth, property, gross receipts, and goods and services taxes in the U.S., state and local, and various foreign jurisdictions. We are subject to audit and assessments by tax authorities with respect to these non-income taxes and may have exposure to additional non-income tax liabilities, which could have an adverse effect on our results of operations and financial condition.

In addition, our judgment in providing for the possible impact of the Tax Act remains subject to developing interpretations of the provisions of the Tax Act. As regulations and guidance evolve with respect to the Tax Act, we continue to examine the impact to our tax provision or exposure to additional tax liabilities, which could have a material adverse effect on our business, results of operations or financial condition.

Our amended and restated certificate of incorporation designates the state or federal courts located in the State of Delaware as the sole and exclusive forum for certain types of actions and proceedings that may be initiated by our stockholders, which could limit our stockholders' ability to obtain a favorable judicial forum for disputes with us or our directors, officers or employees.

Our amended and restated certificate of incorporation provides that, subject to limited exceptions, the state and federal courts located in the State of Delaware will be the sole and exclusive forum for (1) any derivative action or proceeding brought on our behalf, (2) any action asserting a claim of breach of a fiduciary duty owed by any of our directors, officers or other employees to us or our stockholders, (3) any action asserting a claim against us arising pursuant to any provision of the Delaware General Corporation Law, our amended and restated certificate of incorporation or our amended and restated by-laws, or (4) any other action asserting a claim against us that is governed by the internal affairs doctrine. Any person or entity purchasing or otherwise acquiring any interest in shares of our capital stock shall be deemed to have notice of and to have consented to the provisions of our amended and restated certificate of incorporation described above. This choice of forum provision may limit a stockholder's ability to bring a claim in a judicial forum that it finds favorable for disputes with us or our directors, officers or other employees, which may discourage such lawsuits against us and our directors, officers and employees. Alternatively, if a court were to find these provisions of our amended and restated certificate of incorporation inapplicable to, or unenforceable in respect of, one or more of the specified types of actions or proceedings, we may incur additional costs associated with resolving such matters in other jurisdictions, which could adversely affect our business and financial condition.

Because we do not anticipate paying any cash dividends on our capital stock in the foreseeable future, capital appreciation, if any, will be your sole source of gain and you may never receive a return on your investment.

You should not rely on an investment in our common stock to provide dividend income. We do not anticipate that we will pay any cash dividends to holders of our common stock in the foreseeable future and investors seeking cash dividends should not purchase our common stock. We plan to retain any earnings to invest in our product candidates and maintain and expand our operations. Therefore, capital appreciation, or an increase in your stock price, which may never occur, may be the only way to realize any return on your investment.

ITEM 2. UNREGISTERED SALES OF EQUITY SECURITIES AND USE OF PROCEEDS.

Use of Proceeds from Initial Public Offering of Common Stock

On November 13, 2014, our Registration Statement on Form S-1, as amended (Reg. Nos. 333-199069 and 333-200189) was declared effective in connection with the initial public offering of our common stock. There has been no material change in the planned use of proceeds from our initial public offering as described in our final prospectus filed with the SEC pursuant to Rule 424(b) under the Securities Act on November 14, 2014.

On May 2, 2019, we issued an aggregate of 4,430 shares of our common stock to a warrant holder who exercised an outstanding warrant to purchase our common stock at an exercise price of \$15.00 per share, for an aggregation consideration of \$66,456. This issuance was exempt from registration under Section 4(2) of the Securities Act of 1933, as amended, as sales of securities not involving any public offering.

ITEM 3. DEFAULTS UPON SENIOR SECURITIES.

Not applicable.

ITEM 4. MINE SAFETY DISCLOSURES.

Not applicable.

SIGNATURES

Pursuant to the requirements of the Securities Exchange Act of 1934, as amended, the registrant has duly caused this report to be signed on its behalf by the undersigned thereunto duly authorized.

Dated: November 12, 2019

Dated: November 12, 2019

FibroGen, Inc.

By: /s/ James Schoeneck

James Schoeneck Interim Chief Executive Officer (Principal Executive Officer)

By: /s/ Pat Cotroneo

Pat Cotroneo

Senior Vice President, Finance and Chief Financial Officer (Principal Financial and Accounting Officer)

Exhibit 31.1

CERTIFICATION

- I, James Schoeneck, certify that;
- 1. I have reviewed this Form 10-Q of FibroGen, Inc.;
- 2. Based on my knowledge, this report does not contain any untrue statement of a material fact or omit to state a material fact necessary to make the statements made, in light of the circumstances under which such statements were made, not misleading with respect to the period covered by this report;
- 3. Based on my knowledge, the financial statements, and other financial information included in this report, fairly present in all material respects the financial condition, results of operations and cash flows of the registrant as of, and for, the periods presented in this report;
- 4. The registrant's other certifying officer and I are responsible for establishing and maintaining disclosure controls and procedures (as defined in Exchange Act Rules 13a-15(e) and 15d-15(e)) and internal control over financial reporting (as defined in Exchange Act Rules 13a-15(f) and 15d-15(f)) for the registrant and have:
- (a) Designed such disclosure controls and procedures, or caused such disclosure controls and procedures to be designed under our supervision, to ensure that material information relating to the registrant, including its consolidated subsidiaries, is made known to us by others within those entities, particularly during the period in which this report is being prepared;
- (b) Designed such internal control over financial reporting, or caused such internal control over financial reporting to be designed under our supervision, to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles;
- (c) Evaluated the effectiveness of the registrant's disclosure controls and procedures and presented in this report our conclusions about the effectiveness of the disclosure controls and procedures, as of the end of the period covered by this report based on such evaluation; and
- (d) Disclosed in this report any change in the registrant's internal control over financial reporting that occurred during the registrant's most recent fiscal quarter (the registrant's fourth fiscal quarter in the case of an annual report) that has materially affected, or is reasonably likely to materially affect, the registrant's internal control over financial reporting; and
- 5. The registrant's other certifying officer(s) and I have disclosed, based on our most recent evaluation of internal control over financial reporting, to the registrant's auditors and the audit committee of the registrant's board of directors (or persons performing the equivalent functions):
- (a) All significant deficiencies and material weaknesses in the design or operation of internal control over financial reporting which are reasonably likely to adversely affect the registrant's ability to record, process, summarize and report financial information; and
- (b) Any fraud, whether or not material, that involves management or other employees who have a significant role in the registrant's internal control over financial reporting.

Pat Cotroneo Senior Vice President, Finance and Chief Financial Officer (Principal Financial Officer)

Exhibit 32.1

CERTIFICATION

Pursuant to the requirement set forth in Rule 13a-14(b) of the Securities Exchange Act of 1934, as amended ("Exchange Act"), and Section 1350 of Chapter 63 of Title 18 of the United States Code (18 U.S.C. §1350), James Schoeneck, Interim Chief Executive Officer of FibroGen, Inc. ("the Company"), and Pat Cotroneo, Chief Financial Officer of the Company, each hereby certifies that, to the best of his knowledge:

- 1. The Company's Quarterly Report on Form 10-Q for the period ended September 30, 2019, to which this Certification is attached as Exhibit 32.1 ("Periodic Report") fully complies with the requirements of Section 13(a) or Section 15(d) of the Exchange Act, and
- 2. The information contained in the Periodic Report fairly presents, in all material respects, the financial condition and results of operations of the Company.

Dated: November 12, 2019

IN WITNESS WHEREOF, the undersigned have set their hands hereto as of the 12th day of November, 2019.

/s/ James Schoeneck	/s/ Pat Cotroneo
James Schoeneck	Pat Cotroneo
Interim Chief Executive Officer	Senior Vice President, Finance and
	Chief Financial Officer

This certification accompanies the Form 10-Q to which it relates, is not deemed filed with the Securities and Exchange Commission and is not to be incorporated by reference into any filing of FibroGen, Inc. under the Securities Act of 1933, as amended, or the Securities Exchange Act of 1934, as amended (whether made before or after the date of the Form 10-Q), irrespective of any general incorporation language contained in such filing.

VICTORY LAP RE-UP: WHAT'S HARDER TO FIND, THE PYRENEES DATA SET IN AN FGEN PRESENTATION, OR ANDORRA ON A MAP? (FGEN, AZN)

[The following notes on Fibrogen (FGEN) are from November 2019. Re-upping it for a tiny victory lap. The company has known for years that the data was bogus. - Editor]

Both Fibrogen (FGEN) and AstraZeneca (AZN) have replied to reporters (but not the investing public at large) recently in response to the recent posts (see here and here) where we examined the Roxadustat DD-CKD data.

*ASTRA COMMENTS IN EMAILED STATEMENT ON ROXADUSTAT

• FGEN said in an emailed statement "We do not agree with this report, which contains many inaccuracies. The data presented at [American Society of Nephrology] reflect the analytical methods and study pools agreed upon with the FDA

Here at BuyersStrike! HQ we take accuracy seriously and if there is a material error of fact in a post, we will gladly set the record straight, and punish the offending intern with complicated coffee orders and only bags of nickels to pay the pizza guy. However, we believe that both Fibrogen's and AstraZeneca's responses do nothing more than continue to misdirect investors and fail to address the key points of the posts. So, here are some specific questions for both AZN

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 210 of 1730

and FGEN (and their sell side shills) to answer in order to truly clarify the safety data for Roxadustat.

Fibrogen:

In a Bloomberg article published on November 12, Fibrogen is reported to have replied to the author in an email statement that "[the report] contains many inaccuracies". Yet Fibrogen fails to point out a single one. Nobody here at HQ will be holding their breath waiting for FGEN to actually set the record straight. While they try to gin up even a single "inaccuracy", perhaps CEO Jim Schoeneck would also like to answer the following questions:

- Why do you present the ITT data for the NDD-CKD population but not for the DD-CKD population? This is a very simple analysis to perform and you already have the data. Appreciate that it is YOUR unwillingness to share it that causes smart investors to be skeptical.
- Why did you omit the PYRENEES study from the pooled statistical analysis when it compares Roxadustat to the prevailing standard of care? The weak excuse that two different active comparators were used in the PYRENEES study ignores the reality that:
 - Both were considered standard of care (which was the intention of the study).
 - There is an unquestionable death imbalance (more deaths in the Roxadustat arm).
- Astute readers will note that you refuse to state in any of your press releases that for the pooled analysis of ROCKIES, HIMALAYAS, PYRENEES, and SIERRAS:
 - There is no death imbalance in the ITT population.
 - The safety endpoint of non-inferiority in time to all-cause mortality in the intent-to-treat DD-CKD population was met.
 - The safety endpoint of non-inferiority in time to first MACE in the intent-to-treat DD-CKD population was met.

You have a fantastic opportunity to do so right now. Go ahead Jim.

■ In the November 11th conference call with investors and analysts, a simple yes/no question was asked but was not answered:

Answer - Xiaodong Zhang: So the noninferiority margin of 1.3 is already in agreement or not?

Answer – K. Peony Yu: So we are talking about the analysis plan, meaning how do you pool, what's the pooling strategy and the analysis plan, how to analyze the data. When you talk about NI margins, you're talking about the standard for assessment, right? And as I mentioned earlier, that we expect that all regulators will assess the data based on the very — all the — on the entire application of the NDA. And based on our dialogue with FDA over the past 6 years and the data, as we have shown, we are confident that we do have what it takes for this drug to be favorably evaluated.

As appears to be the case with analysts these days, the person asking the yes/no question seems completely fine with a confusing, non-binary (or is the proper terminology "reality-non-conforming") answer and doesn't bother to follow up. We believe this simple question should have been answered. This is another great opportunity for Schoeneck and his crew at Fibrogen to set the record straight and provide an answer to the question.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 211 of 1730

Public companies do not generally hide good news. If Roxadustat is safe in the DD-CKD population FGEN should gleefully disclose the full data set so physicians and investors alike can evaluate it on its merits.

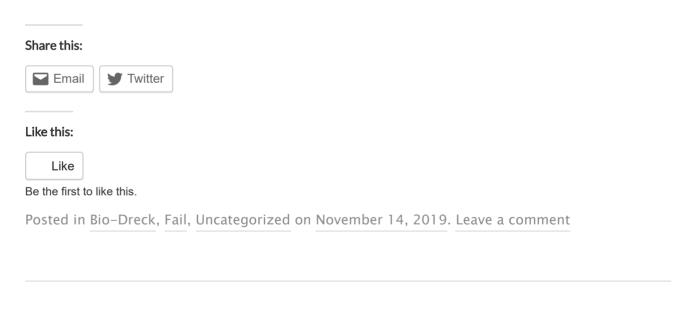

AstraZeneca (AZN):

AstraZeneca, also in an emailed correspondence to a Bloomberg reporter stated "the exclusion of the Pyrenees data from the safety analysis was agreed upon with the regulator." We understand that AstraZeneca may not have any input into the statements Fibrogen makes so in addition to the questions above, there is a very simple one below:

Why would the regulators agree to omit from the safety analysis a clinical study with a clear all-cause mortality imbalance that sheds light on the safety profile of a drug?

Ah, the sound of crickets in Andorra.

Geoffrey Craig Porges *SVB Leerink LLC, Research Division*

Presentation

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Relatively recently appointed CEO, Enrique Conterno, and other members of the FibroGen team. Hi, Peony. So welcome to GHC this year.

Enrique A. Conterno

CEO & Director

Thank you, Geoff.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Your first GHC, how is it going?

Enrique A. Conterno

CEO & Director

I think it's going awesome. We had a packed agenda today, met with a number of investors. Very good.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division Good.

Question and Answer

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Yes. So let's jump right in. You mentioned a lot of questions about the launch in China. How's the launch in China going? Are you actually commercial at this point? Great news on the NRDL, but that was last year's news. So how are things going this year?

Enrique A. Conterno

CEO & Director

Well, the NRDL was an important achievement. It was last year's news, but it was effective as of January 1. We are very much tracking, I think, and we're very encouraged with what we're seeing when it comes to both hospital listings and demand on those hospital listings. Honestly, I'm pretty impressed with what the team has achieved.

Of course, we also have the coronavirus right now in China, which has meant that it is difficult to, if not impossible, to access any hospitals, and clearly, that has a bit of an impact.

Roxa has a bit of a unique position in China for a number of different reasons. But as an oral product, clearly, you really don't need to go to the hospital. So when it comes to, for example, PD patients and so forth, it represents an interesting alternative for patients that really don't want to go into the hospital at this point in time.

So far, I think we are very pleased with what we're seeing despite the fact that we have the coronavirus.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Okay. And how is it actually working? I mean, I think your price was \$2,100 or something like that and obviously equivalent in local currency. And how much of a discount are you required to take once you get the local or provincial reimbursement? And then could you talk about, in the initial demand, how patients are -- do they have significant out-of-pocket burden? Can you kind of cover that out-of-pocket burden?

Enrique A. Conterno

CEO & Director

Sure. So I think what we've shared is that the net price that we estimate would be, getting for a patient for a full year in China, is about \$1,500. The out-of-pocket is going to be dependent on the different provinces and also whether it's a dialysis patient or an NDD patient. But I think it's -- we're still in the early stages. Keep in mind that provinces were given through Q1 to be able to implement the reimbursement system. But so far, I think we are pleased with the demand. But we have to -- it's very early, I think, in the stages of the launch for us to make too many assessments in terms of what is the exact out-of-pocket that patients are paying.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Okay. And are you finding that you're getting more traction in the dialysis patients or the nondialysis patients? Very much a very different context.

Enrique A. Conterno

CEO & Director

Yes. It's difficult to say at this stage. But clearly, dialysis is a pretty big focus for us, given that those patients are treated for anemia. So -- and there is a pretty big opportunity. So that's really where the initial focus and the uptick that we expect initially is going to be, keeping in mind that the NDD opportunity also in China is a very significant one from a [patient's] perspective.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Yes, it's obviously large. Now one of the questions that keeps coming up is the question of the ownership of the Chinese joint venture. Could you talk about the option of spinning that out or capitalizing that independently? How -- who makes the decision on that? How you might come to a decision about that?

Enrique A. Conterno

CEO & Director

Yes. Clearly, as we think about China, there are many options the company have. At this point in time, I'm not commenting on our -- the options that we have for our Chinese business. I think my focus, and appropriately so right now as we're launching the product, have to be ensuring that we are getting the fundamentals right and that we can build and create a very significant ongoing business. I think I want to make sure that there is the focus on the task at hand right now.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Okay. Now is there any intention, for example, to licensing complementary renal products or anything into that entity that you have there?

Enrique A. Conterno

CEO & Director

We're always open to think about those opportunities, but it's not a focus for us right now. I think our focus is, once again, to grow roxa to be the type of transformational medicine that it can be. It's a pretty unique opportunity to have this type of medicine, and China represents a very significant market. Keep in mind, it is the largest dialysis market in the world and we want to -- and we have achieved reimbursement across CKD anemia and a reasonable price. So we need to make sure that we capitalize in the hand that we have right now.

We're always open to look at additional opportunity, in particular, complementary opportunity, but I think it's fair to say that, that is not the focus today.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Okay. Let's just pivot to talk about the U.S. market. Is your expectation that you will get essentially the same labeling and market opportunity in the U.S. as you've been given in China?

Enrique A. Conterno

CEO & Director

Yes. So clearly, in the U.S., we submitted our application at the end of last year. We've been -- our filing has been accepted, and we have a PDUFA date of December 20 of this year. We submitted for both, dialysis-dependent and nondialysis-dependent patients, patients with anemia. So we are planning to basically pursue both opportunities.

Just to give a sense of the magnitude of the opportunity. As you know, in the U.S., there's about 600,000 patients on dialysis. About 90% of those patients are treated for anemia. That gives you about 5,500 patients -- sorry...

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

550,000.

Enrique A. Conterno

CEO & Director

550,000 patients that, in terms of patients, that is the addressable opportunity with roxadustat.

Copyright © 2020 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

If we think about NDD, the opportunity -- the addressable opportunity is about 10x as large. We're looking at an opportunity of about 5 million addressable patients. Keep in mind that the number of patients treated in this segment is basically in the low double digits. So you -- we are thinking about...

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Sorry. As a percentage of that total treated for anemia?

Enrique A. Conterno

CEO & Director

Correct.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Okay. That's what I thought you said.

Enrique A. Conterno

CEO & Director

So we are looking at basically an opportunity, yes, patients that are treated, but also, I think it's going to be important here, the significant expansion opportunity to be able to reach more patients for -- and for those patients to be treated.

Let's keep in mind that before EPO had some of the issues and they received a black box, the rate of treatment of anemia in this population was significantly higher, right?

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Yes. How high did it get? From recollection, it was in the high 20s, something like that?

Enrique A. Conterno

CEO & Director

That is correct. I think the figures that I've seen is, when you look at the prior 12 months of going into dialysis, up to 30% of those patients used to be treated. That number today is closer to 14%.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

And how many do you think are actually sufficiently anemic to qualify for the label that you expect to get?

Enrique A. Conterno

CEO & Director

Well, I think it's -- there are several questions there, a question on the label. But I do think that's the addressable population. So I'm giving you the number of the addressable population that we basically expect. It is not, to me, as much a matter of whether those patients need to be treated, but how do we ensure that we convey the right messages and the benefits of treating some of those patients.

And maybe we can speak a little bit about that because there are significant benefits. Of course, when we look at -- and just to recap, we basically, for our U.S. submission, when it comes to NDD, we have, based on our agreement with the FDA, we have 3 pivotal trials: ANDES, ALPS and OLYMPUS. They comprise over 4,000 patients. And across all the studies, we reached our primary efficacy endpoint of raising hemoglobin.

But I don't think the story ends there. I think it is interesting to see the effectiveness -- the efficacy of the product across a broad range of patients, all right, that today don't have as many options whether they

are hyper-responders, or in some cases, maybe don't tolerate well EPO, or in some cases, they need much higher EPO doses over time.

I think we have a product here with a very nice profile, and importantly, I think in NDD, we basically saw much less transfusions. So if I recall the numbers, it's 15% of transfusions for patients that were on placebo. We only saw about 5% for patients that were on roxadustat. To me, I think that is a significant benefit, a significant benefit to the patient, but also to the payer and to the system.

And then, of course, there is this question of, well, how does the cardiovascular safety look like. As you're aware, I've had a chance to conduct and be part of a number of cardiovascular studies in my previous role, and I believe that the data that we have on cardiovascular safety is very compelling. We have agreed with the agency on both the post studies. So what are the studies that are going to be included as part of the analysis as well as the methodology that we will be utilizing for this particular segment we basically intend to treat, a statistical plan methodology.

And when we look at the data, basically -- we basically show to be comparable to placebo. And importantly, when we look at the subcomponents of MACE, we had, of course, MI and stroke and death and...

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Unstable angina.

Enrique A. Conterno

CEO & Director

Hospitalization for heart failure and hospitalization for unstable angina. We -- when we look at all those, in each -- for each one of the subcomponents, that confidence interval actually encompassed one which makes our data extremely clean in -- from a -- from my perspective when it comes to cardiovascular safety.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Enrique, sorry, can I just interrupt a moment. But from your prior experience, I think the FDA has pretty much said that up above the confidence interval of 1.3. And are you below that 1.3 for the subcomponents of MACE or just for overall MACE?

Enrique A. Conterno

CEO & Director

Yes. Keep in mind that the guidance that the FDA has provided is strictly for diabetes medicines, and the guidance for diabetes medicines is a 1.3 upper bound. So that means to -- we want to make sure -- the FDA wants make sure that products can exclude more than 30% risk of MACE events -- increased risk of MACE events.

There is no such guidance for CKD anemia, which means that the FDA will have a -- this will become a product review issue when they look at the benefit/risk profile of the product.

Now in the case of the diabetes products, just to go back, the FDA looks at MACE, so the 3 components. They don't look at the subcomponents when it comes to the upper bound because the numbers are a lot slower. So the confidence intervals tend to be a lot wider.

Now in our trial, when we look at the pooled analysis of ANDES, ALPS and OLYMPUS, we do basically see hazard ratios, about one -- slightly higher than one, but the upper bound in each one of these cases, is below 1.3. I do want to make the point the 1.3 number is an arbitrary number, okay? It was arbitrary for diabetes, and it's just a number. So at the end, I think it's a question of looking at what are the options. Keep in mind that the option today for those patients in NDD is really the EPOs actually have a black box and actually had a demonstration of -- sorry, a further trial. When we look at the stroke data, actually

stroke itself have a confidence interval to the right of one, so -- which is a statistically significant finding for higher stroke. So I...

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

For EPO?

Enrique A. Conterno

CEO & Director

For the erythropoietin, yes. So I find that our data, for all those reasons, is highly compelling. There are not many options, and we have a trial that, in my view, basically, shows safety against what I think is a very high hurdle of placebo.

It will be different if maybe we were in this particular population using another comparator, but I do like, and this question also comes quite a bit, which is why did you choose a trial against placebo instead of a trial against EPO.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Yes. Comes up.

Enrique A. Conterno

CEO & Director

Clearly, both choices are available, but I like the decision that we have made at FibroGen. This decision, of course, was made way before my time, but I think it gives you the best chance for a completely clean label because you are comparing yourself relative to placebo. And then, I think if you look at the data on its face, I do not believe that the data warrants a black box.

Now there's a lot of context when we discuss a black box, and of course, there's a black box for EPO agents in the class. I get that, and the FDA takes many considerations. But I do think that it is a pretty high standard, and I'm very excited and delighted with the results that we got in -- out of cardiovascular safety.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Okay. A lot of pieces there. But -- so your base case assumption is that you do get the broad label presumably, and that potentially you don't get a black box for any of these cardiovascular events?

Enrique A. Conterno

CEO & Director

Yes. I think of -- it is the base case is, yes, that we have a broad label. And I think the base case for me is also that we get a black box, but we have the optionality of an upside of not be able to get one, given the data that we have. But that is an upside, I think, to our current plans.

We can be extremely successful. This would be a transformational medicine, regardless. Given the opportunity that we have, as we talked about 0.5 million patients on the DD side and 5 million patients on the NDD side and how do we ensure that as many of those patients are appropriately treated, I think, is going to be key.

Clearly, we are already thinking about our commercial plans. I already started discussions in many different forums with our partner, AZ in the U.S. I'm delighted to be working with AstraZeneca and I think it's going to be key for us to have a very strong launch.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Sorry, I'm conscious of time. So there's a bunch of things I want to try and get to, Enrique. First, do you expect an Adcom or not?

Enrique A. Conterno

CEO & Director

I think it's difficult to say. As you know, one, when you receive an acceptance of the filing, it is a typical time when you can get notice that you're going to receive an Adcom. We have received no indication at this stage of an Adcom. It doesn't mean that this is not a possibility, it could happen. We are preparing for an Adcom regardless. I think that -- because once they tell you, you have, I think, 45 business days to...

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Subscribe.

Enrique A. Conterno

CEO & Director

Yes. So we've got to prepare ahead of time and we're doing so right now.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Okay. Reimbursement under the ESRD, whatever it is, reimbursement. So when do you apply for the NTAP, I think it is?

Enrique A. Conterno

CEO & Director

TDAPA?

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

TDAPA, yes. When do you apply for that? And when will you get an indication if you don't have access to that?

Enrique A. Conterno

CEO & Director

So TDAPA is an add-on payment for products they're going to be setting into the dialysis centers. Otherwise, they would be in the bundle, right? It's a policy basically incentivize so that innovation can come in and can be utilized. We believe that roxa meets all the requirements and conditions for TDAPA. So I say that is our base case for us is to be given an add-on payment, which would be outside of this capitated payments that these organizations receive.

The process is, once you get approval, you have the opportunity to submit for TDAPA. And typically, that process takes somewhere within the next -- within 3 months, and you're able to basically be able to get the reimbursement or not. But we feel good about that we meet the conditions and I think this can be very helpful for us to be included.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

And TDAPA is to be realized how long, 2 years?

Enrique A. Conterno

CEO & Director

Yes. It will be -- it's a 2-year payment. And then I think the idea is that the product will be then included in the bundle of hemodialysis.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Okay. And during those 2 years, let's just hypothetically say that it's, I don't know, I'll pick a number say, \$300 a month is the cost to CMS for roxa. So they would pay the dialysis centers an extra \$300 a month for every patient they put on to roxa. And would they leave the capitated rate the same regardless of the fact that they're paying for EPO?

Enrique A. Conterno

CEO & Director

It's -- you're asking lots of questions. You know this TDAPA has been evolving and there are new guidelines even as of late last year, November. We have to see how all this is going to play out, but if you read how this is supposed to be implemented, yes, it is an add-on payment to whatever capitated payment there is. It doesn't mean that they couldn't adjust the capitated payments, but the add-on payment will be based on the average selling price plus 0, so it's a net 0 average selling price and so 100% of the average selling price. And this will be the payment that would be provided for those organizations to be -- for patients that are -- based on the number of patients that are basically on roxadustat.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Okay. So this is important. So what do you think the likelihood is that they lower the bundled rate? I mean I'm just of the impression that changing the bundled rate is a complicated process with a lot of inputs and everything. It would seem to me to be pretty hard to lower the bundled rate at the same time they give you access to TDAPA reimbursement.

Enrique A. Conterno

CEO & Director

Yes. It's difficult to say how things are going to play out. I don't think that's the intent. I think the intent is to provide truly an add-on payment. But it's difficult to predict how things are going to play out. Regardless, though, whether they lower the capitated payment or not, the -- how the add-on payment is calculated is pretty clear.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Yes. No, that's clear. The add-on is clear.

Enrique A. Conterno

CEO & Director

So -- but that's really something that we think about, and of course, is concerning to roxadustat, making sure that we can get an acceptable price and making sure that there are incentives in the system so that they can basically include valuable innovation as part of the overall dialysis system.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Okay. Sorry I keep asking questions about this. But do we have examples where oral analogs of injectable medicines have been added via TDAPA?

Enrique A. Conterno

CEO & Director

I am not familiar with this. Clearly -- and I think you're asking this question for -- due to this language in TDAPA of the oral-only language.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Yes.

Enrique A. Conterno

CEO & Director

The way we think about this is that, in this particular case, the reason that roxa can meet the criteria is because we need to be thinking of anemia functionally, and as part of that, of course, there are injectable alternatives to treat anemia. So we do believe that we could be included in TDAPA. That's the assumption that we're making right now.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Yes. Okay. Terrific. So last couple of seconds. Why doesn't anyone care about pamrevlumab? You're doing 3 Phase III trials.

Enrique A. Conterno

CEO & Director

We're not only doing 3 Phase III trials, but I view this as -- this is another jewel, and we have 3 trials on indications that are of high unmet medical need. If we think about IPF, pulmonary fibrosis, the effect size that we saw in Phase II, I think, is very impressive, not just when it comes to looking at forced vital capacity, but more importantly also, looking at some of the markers that we had when it comes to disease progression. Individually, that indication is very important.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Yes.

Enrique A. Conterno

CEO & Director

But now we also have pancreatic cancer, another very significant indication. And we -- those 2 trials Phase III programs are ongoing, and we're now starting DMD this year. Collectively -- I think the message is that, collectively, those indications are massive opportunity for a company the size of FibroGen. So very excited. The key for us is to accelerate our enrollment time lines, and we are working to ensure that is the case and that we can reach patients as quickly as possible.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Great. Okay. We've reached the end of our allotted time. So thank you very much, Enrique. Really appreciate it. Glad to see you here.

Enrique A. Conterno

CEO & Director

Yes. Thank you. Thank you.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Thank you for joining us.

Enrique A. Conterno

CEO & Director Very good.

Operator

Ladies and gentlemen, thank you for standing by. And welcome to the FibroGen Fourth Quarter and Full Year 2019 Conference Call. [Operator Instructions] Please be advised that today's conference is being recorded. [Operator Instructions]

I would now like to hand the conference over to your speaker today, Mike Tung. Thank you. Please go ahead, sir.

Michael Tung

Investor Relations Executive

Thank you, Justin. And good afternoon, everyone. Thank you for joining us on today's call to discuss FibroGen's performance for the fourth quarter and full year 2019. Today's call will be led by Enrique Conterno, our Chief Executive Officer; Enrique will be joined by Dr. Peony Yu, our Chief Medical Officer; Ms. Chris Chung, our Senior Vice President of China Operations, Dr. Elias Kouchakji, our Senior Vice President of Clinical Development, Drug Safety and Pharmacovigilance; and Mr. Pat Cotroneo, our Chief Financial Officer.

Before we begin, I would like to point out that we may make forward-looking statements regarding our business, including our collaborations with AstraZeneca and Astellas; financial guidance; the initiation, enrollment, design, conduct and results of clinical trials; our regulatory strategies and potential regulatory results; our research and development activities; commercial results and results of operations; risks related to our business and certain other business matters. For risks and uncertainties regarding our business and statements made on the call today as well as factors beyond our control that may cause differences between current expectations and actual results, we refer you to our annual report on Form 10-K for the fiscal year ended December 31, 2019, all with the Securities and Exchange Commission. Copies of these filings can be found in the Investors section of our website. We undertake no obligation to update any forward-looking statement, whether as a result of new information, future development or otherwise.

The format for today's call includes prepared remarks from FibroGen's management team, and then we'll open the lines to take your questions. The press release reporting our financial results and business update and a webcast of today's conference call can be found on the Investors section of FibroGen's website at www.fibrogen.com. The webcast will be available for 30 days from today's date.

And now I'd like to hand the call over to Enrique Conterno, our CEO.

Enrique A. Conterno

CEO & Director

Thank you, Mike, and good afternoon, everyone. And welcome to our fourth quarter and full year 2019 earnings call. I'm excited to join the call today in my new role as FibroGen's CEO. I will start this morning by sharing a few thoughts about FibroGen and some initial impressions. I would also like to give you a sense of my initial areas of focus moving forward to deliver value to both patients and shareholders.

FibroGen has 2 world-class scientific platforms, and our success comes from keeping patients and science at the core of what we do. Before I provide an overview of our progress, I would like to take this opportunity to acknowledge Tom Neff, the founder of FibroGen, who passed away last year. I thank him for his invaluable contribution to making FibroGen what it is today, and I look forward to honoring his legacy.

I am highly appreciative of what the company has accomplished, and I look forward to continuing to build on this strong foundation. I have been spending time with my team, getting a clear sense of our strengths and challenges, and I've had the opportunity to hear from our shareholders and the broader investment community. My assessment is clear. FibroGen has a unique opportunity to leverage our world-class science in 3 areas of focus.

Number one, ensuring regulatory and commercial success of roxadustat, a transformational medicine in anemia therapy, first demonstrated in patients with chronic kidney disease, with great potential for expansion of treatment to other anemias.

Number two, accelerating the development of pamrevlumab in 3 high-value indications: idiopathic pulmonary fibrosis, locally advanced and resectable pancreatic cancer and Duchenne muscular dystrophy.

And number three, maximizing our scientific and medical understanding of HIF and CpG biology to provide future innovation.

Before we move into our review of 2019, I'd like to provide some overall perspective on the roxadustat commercial opportunity. As anemia associated with chronic kidney disease, or CKD, continues to grow in worldwide prevalence, our work has never been more important. Anemia is common in patients with CKD stages 3 to 5, and the rate of anemia increases as CKD progresses. We estimate that there are 4.9 million CKD non-dialysis patients with anemia in the United States. And that are up to 50% may be addressable based on our expected label. Additionally, there are approximately 0.5 million dialysis patients with anemia in the U.S.

In 2019, we made significant progress with roxadustat and achieved several critical advances, and we see continued momentum through 2020. Notably, the roxadustat NDA was submitted in the U.S. for the treatment of dialysis-dependent and non-dialysis-dependent CKD anemia late last year. And the filing was recently accepted with a PDUFA date of December 20, 2020.

In China, we and our partner, AstraZeneca, achieved roxadustat inclusion in the National Reimbursement Drug list, an important milestone to accelerate market adoption and coverage. Initial uptick of hospital listings and demand are encouraging.

In Japan, our partner, Astellas, received approval and launched roxadustat, which has the trade name, Evrenzo, in anemia in dialysis-dependent CKD patients, and submitted a supplemental NDA for the non-dialysis indication in this past January. Finally, in Europe, we and our partner, Astellas, look forward to the upcoming submission of roxadustat for treatment of dialysis and non-dialysis-dependent CKD anemia in the second quarter of this year.

Moving on to pamrevlumab, a first-in-class antibody, which inhibits the activity of connective tissue growth factor, a common factor in chronic fibrotic and proliferative disorders. In 2019, we initiated our ZEPHYRUS Phase III clinical program of pamrevlumab in patients with idiopathic pulmonary fibrosis. Last year, we also initiated our LAPIS Phase III clinical program of pamrevlumab for the treatment of patients with locally advanced unresectable pancreatic cancer. In Duchenne muscular dystrophy, we reported positive Phase II data in 2019, and we expect to begin the pivotal Phase III program in the second half of this year. All 3 of these indications are orphan diseases, with limited treatment options. Accelerating enrollment in all of these Phase III programs is a top priority for me in 2020.

We are in a position to create significant value for patients and shareholders. Our 2020 priorities are focused on getting roxadustat approved in the U.S., advancing pamrevlumab development and finally, leveraging our expertise in both hypoxia-inducible factor and connective tissue growth factor biology to expand our pipeline on novel drug candidates.

Now I'll turn it over to Peony, who will provide you with a more in-depth discussion of roxadustat.

K. Peony Yu

Chief Medical Officer

Thank you, Enrique, and good afternoon, everyone. 2019 was a great year for roxadustat, and I would like to review some of the highlights. The roxadustat NDA was submitted to the FDA for the treatment of anemia in both dialysis-dependent CKD and non-dialysis-dependent CKD patients in December 2019. And FDA has accepted our NDA filing with PDUFA date of December 20, 2020. Roxadustat was approved in China for the treatment of anemia in DD-CKD patients at the end of in 2018 and for the treatment of NDD-CKD anemia in August 2019. Chris will go into more detail later in the call when she provides an update on FibroGen China.

In Japan, roxadustat was approved for the treatment of anemia in DD-CKD patients in September 2019 and the supplemental NDA for NDD-CKD was submitted this past January. With positive momentum, we look forward to advancing roxadustat in 2020.

In the U.S., we continue to support the FDA's review of our NDA and expect approval before the end of the year. There has been no indication at this time the FDA will hold an advisory committee meeting, but we are preparing as if there were one.

To optimize our business success in the U.S., we and our partner, AstraZeneca, continue commercialization preparation to pave the way for roxadustat to become accessible to patients. With the robust efficacy and safety profile demonstrated in our large Phase III program of over 8,000 patients, we believe roxadustat can potentially better address CKD anemia than what is currently available to CKD patients on dialysis and those not on dialysis.

I shall first summarize key positive efficacy and cardiovascular safety results from the over 3,800 patient pool of dialysis-dependent patients, where roxadustat was compared to epoetin alfa, and patient had a average treatment duration of 1.8 years.

As reported at the ASM meeting, in dialysis patients, roxadustat met the primary efficacy endpoint with larger hemoglobin increase than epoetin alfa in each of the 3 pivotal studies and in the pool analysis, while mean achieved hemoglobin levels were within the intended range. Roxadustat-treated patients had lower transfusion risk than EPO patients, while lowering MACE+ risk in the dialysis patient pool. Notably, unlike ESA, roxadustat maintain efficacy without increasing dose requirements in the presence of inflammation. Importantly, less IV iron supplementation was required with roxa than with EPO.

Within the dialysis patient population, we are particularly excited about the cardiovascular safety results of the incident dialysis of population. These patients entered the study during the first 4 months of dialysis initiation and had an average treatment duration of 1.5 years. We enrolled over 1,500 incident dialysis patients in this program, the largest in this population ever conducted.

Here, we demonstrated a meaningful reduction in cardiovascular safety risk, as roxadustat-treated incident dialysis patients had a 30% lower MACE risk and a 34% lower MACE+ than epoetin alfa-treated patients. We believe the high-risk incident dialysis population is the right and most appropriate setting for comparison of roxadustat versus the epoetin alfa, since most patients are ESA-naive to prior to study entry.

Now moving on to our non-dialysis program. I will summarize key positive efficacy and cardiovascular safety results from the over 4,200 pool of non-dialysis-dependent patients, where roxadustat was compared to placebo. As a reminder, the vast majority of NDD patients in the U.S. receive no ESA treatment, especially after the ESA label change over the period of 2007 to 2011. And placebo control is the preferred standard for safety comparison.

In NDD patients, roxadustat was superior to placebo in the primary efficacy endpoint of mean change in hemoglobin level from baseline and significantly reduce transfusion risk compared to placebo. Because roxadustat is conducive to IR mobilization, we demonstrate the roxadustat's efficacy in patients with lower iron stores than required for ESA. 40% of the patients in our Phase III NDD studies have baseline iron stores below the minimum required for treating -- for treatment with ESA, and demonstrate the hemoglobin response to roxadustat was similar to that of patients with iron repletion.

With respect to cardiovascular safety, roxadustat was comparable to placebo in risk of MACE and MACE+, while achieved a mean hemoglobin level of 11 grams per deciliter. With this favorable efficacy and safety profile in addition to the convenience of oral dosing, we believe roxadustat can potentially overcome a number of hurdles of ESAs and expand anemia treatment in NDD patients.

Beyond CKD, we continued development of roxadustat for the treatment of anemia associated with myelodysplastic syndrome for chemotherapy-induced anemia, while evaluating for additional diseases. Our vision for roxadustat is to become the standard-of-care for anemias broadly.

Last December, we presented positive results from the open-label portion of the Phase III global study evaluating roxadustat for treatment of anemia in MDS patients at the Annual American Society of Hematology Meeting. In 2019, we also initiated a Phase II study in chemotherapy-induced anemia. CIA represents a large patient population whose anemia is often left untreated today.

To make roxadustat available to the rest of the world, our partner, AstraZeneca, in collaboration with our team, is submitting marketing application of roxadustat for CKD anemia in a number of countries. We've already submitted to Canada, Mexico and several Asian countries. It is great to see all this progress in the months, following the 3 permanent scientists, including Dr. Bill Kaelin, our long time adviser and collaborator, were awarded the 2019 Nobel Prize in Medicine for discoveries in oxygen sensing, which serve as the important scientific basis for the development of roxadustat. We appreciate the medical community's strong support for roxadustat and look forward to the opportunity in working with physicians, nurses and patients to improve anemia care globally.

I would now like to turn the call over to Chris Chung, who will discuss the recent developments in China.

Christine L. Chung

Senior Vice President of China Operations

Thank you, Peony. 2019 was also a milestone year for FibroGen China. Roxadustat was launched the middle of last year. This established FibroGen as a commercial stage company. Beyond FibroGen, it was a historical milestone in global drug development, in that, for the first time in history, China was the first-launch country for a first-in-class drug. Roxadustat was added to the 2019 National Reimbursement Drug List, or NRDL, effective January 1, 2020. Reimbursement by the government greatly reduces the copay portion for patients and is critical to market adoption.

As Peony already stated, in August, the NMPA approved roxadustat for non-dialysis. Roxadustat has the unique benefit of oral administration, and we believe the NDD approval will greatly extend the reach of roxadustat to patients-in-need beyond dialysis. FibroGen earned \$22 million in milestone payments from AstraZeneca, triggered by the NRDL inclusion.

Looking forward to 2020, with reimbursement for roxadustat now available on a national basis, our top priority is hospital listings. A drug needs to be listed in a hospital formulary before it can be dispensed for 90-plus percent of the potential market represented by government hospitals. This process is done on a hospital-by-hospital basis.

Given the transformative nature of roxadustat, an equally important priority for us is physician education. As for the market potential in China, we believe there are over 600,000 dialysis patients in China, making this the largest dialysis population in the world. It is expected to continue to grow in the foreseeable future at a low double-digit rate. We estimate the addressable population in non-dialysis with anemia to be around 2 million to 3 million patients.

Anemia treatment has historically been limited to oral iron, intravenous iron and ESAs. We believe the oral nature of roxadustat and the absence of a box warning could greatly expand the addressable NDD patient base as well as increased treatment rates and persistency in this population.

Coronavirus continues to be an evolving situation in China and beyond. While ensuring the health of our employees, our top priority is in making sure that roxadustat is available to patients. As of today, both our drug product facility in Beijing, and our API facility in Hangzhou, have returned to operations after a short period of shutdown. Our ability to conduct in person visits to physicians and hospitals continues to be affected, and we will continue to monitor and assess the situation closely.

I will now turn the call over to Elias Kouchakji, who will provide an update on the pamrevlumab program.

Elias Kouchakji

Senior Vice President of Clinical Development, Drug Safety & Pharmacovigilance

Thank you, Chris, and good afternoon. I would like today to review our accomplishments with pamrevlumab over the last year and update you on our plan for 2020. In 2019, the FDA and the EMA,

both granted orphan drug designation for pamrevlumab and the treatment of the Duchenne muscular dystrophy, also known as DMD. This has strengthened our commitment to developing our novel antibody as a potential new treatment option for those suffering from this debilitating and progressive disease.

Also, in the last year, we began enrollment in our pivotal Phase III trials, in both idiopathic pulmonary fibrosis and in pancreatic cancer. These studies are ZEPHYRUS, a Phase III randomized, double-blind, placebo-controlled study; evaluating pamrevlumab and IPF; and LAPIS, a Phase III randomized, double-blind, placebo-controlled study in locally advanced unresectable pancreatic cancer.

In September of last year, Lancet Respiratory Medicine published our PRAISE Phase II study data in IPF. The published data for this randomized, double-blind, placebo-controlled study showed that both: one, the decline in forced vital capacity percent predicted; and two, the proportion of patient with the disease progression were significantly lower in the pamrevlumab group than in the placebo group.

In an accompanying editorial, Dr. Athol Wells of Royal Brompton Hospital wrote, "It is difficult to imagine a more encouraging Phase II trial." As we move forward with our Phase III program, we are gratified by the interest of our KOLs in the pulmonology community have shown in pamrevlumab as a potential new therapy for IPF.

In 2020, we are planning to accelerate and expand development of pamrevlumab. We are focused on accelerating enrollment of our ongoing ZEPHYRUS Phase III study and IPF. And to strengthen our regulatory submission, we now plan to add a second Phase III study. This change will mitigate the risk of having single study of approximately 560 patient, and now we plan to enroll approximately 340 patient in each of these 2 studies. The primary efficacy endpoint, and this is going to be the change from baseline and forced vital capacity, FVC. And the secondary endpoint will include clinical outcomes of disease progression, patient-reported outcomes and quantitative changes in lung fibrosis volume from baseline.

Moving on to the LAPC Phase III trial, LAPIS. We will continue to activate sites in the U.S. and globally to expand and accelerate enrollment of this approximately 260-patient trial.

In the second half of 2020, we also look forward to starting a Phase III trial evaluating pamrevlumab as a treatment for Duchenne muscular dystrophy. We are in discussion with the FDA and EMA to finalize the design of the program.

I will turn now the call over to our CFO, Pat Cotroneo, for the financial update. Pat?

Pat Cotroneo

Senior VP of Finance & CFO

Thank you, Elias. As announced today, total revenue for the quarter ended December 31, 2019, was \$8 million as compared to \$108.1 million for the fourth quarter of 2018. The current quarter revenue was made up of \$43.2 million in license and development revenue, plus \$1.1 million in net product revenue, less an adjustment relating to API pricing for Japan, which I will describe momentarily.

For the same period, operating costs and expenses were \$108.4 million, and net loss was \$98.1 million or \$1.12 per basic and diluted share as compared to operating costs and expenses of \$88.1 million and a net income of \$21 million or \$0.25 per basic share and \$0.23 per diluted share for the fourth quarter last year.

Included in our fourth quarter 2019 revenue recognition methodology is a total of \$22 million in milestones associated with the inclusion of roxadustat to the China NRDL in December. In the fourth quarter 2019, we recorded net product revenues of \$1.1 million for roxadustat sales in China. In addition, in the fourth quarter 2019, we recorded a reduction of \$36.3 million for commercial API delivered to Astellas in 2018, prior to approval and the establishment of the listed price in Japan. The original sale of API was based on an estimated listed price. The actual price was set by the Japanese Ministry of Health, Labor and Welfare in Q4 2019. Included in operating costs and expenses for the quarter ended December 31, 2019, was an aggregate noncash portion totaling \$22.1 million, of which \$17.4 million was a result of stock-based compensation expense as compared to aggregate noncash portion of \$15 million, of which \$13.7 million was a result of stock-based compensation expense for the same period in the prior year.

As stated in our Q2 2019 results, in accordance with U.S. GAAP, we recognized a total of \$180 million, comprised of \$50 million for an anticipated milestone from AstraZeneca related to the filing of the U.S. NDA, and \$130 million in anticipated milestones from Astellas in connection with the EU MAA filings, when such milestone achievement become probable. As noted earlier on this call, our NDA submission was accepted for review by the FDA in February, and we expect the Astellas MAA submission to occur in the second quarter of 2020. Based on these milestones and our latest forecast data, we estimate our 2020 ending cash to be in the range of \$720 million to \$730 million, assuming U.S. NDA approval in Q4 2020.

Looking ahead, we have a total of \$425 million in anticipated milestones expected over the next 18 months, which includes the \$180 million of milestones on NDA and MAA submissions already mentioned, plus \$245 million of milestones on approvals and first sale. The \$245 million is essentially equally split between our anticipated NDA and MAA approvals.

At December 31, 2019, FibroGen had \$627.1 million in cash, restricted time deposits, cash equivalents, investments and receivables.

Thank you. And I would now like to turn the call back over to Enrique.

Enrique A. Conterno

CEO & Director

In closing, this is an exciting time for FibroGen. Roxadustat is launching in China and Japan, and has been submitted in the U.S., Canada and other countries and soon in Europe. We are committed to bringing pamrevlumab as a first-in-class and best-in-class new medicines to patients in 3 high-value indications, namely idiopathic pulmonary fibrosis, locally advanced unresectable pancreatic cancer and Duchenne muscular dystrophy.

We look to re-energize our research agenda to deliver on our unique scientific expertise of both hypoxia inducible factor and connected tissue growth factor biology to create a fulsome pipeline of next-generation drug candidates.

We are in a strong financial position as roxadustat sales ramp up, with approximately \$630 million in cash and another \$425 million in anticipated roxadustat milestone payments expected over the next 18 months. In addition, we received partner reimbursement for development and commercialization of roxadustat in all geographies outside China. In China, we shared these expenses with AstraZeneca, 50-50.

I want to thank our team here at FibroGen for their dedication to improve the lives of patients that we serve. I would also like to thank Jim Schoeneck, who served as interim CEO and who will continue as Chairman of the Board.

Now I would like to turn the call back to the operator for questions. Justin?

Question and Answer

Operator

[Operator Instructions]

And our first question comes from Michael Yee from Jefferies.

Michael Jonathan Yee

Jefferies LLC, Research Division

Congrats, Enrique, on all the accomplishments recently. Two questions. One on pamrevlumab. I thought it was quite notable and you focused on accelerating IPF and pancreatic and just sort of the overall program. Maybe you could comment about specifically what you're doing to do that? Is that just site activation? Is that just more boots on the ground? Maybe talk about that. And whether you actually think you could get an interim on resection rate in pancreatic cancer in, say, 2021. Is that an achievable milestone?

And then on roxa, my question is, there is, obviously, some competitors around you, one of which will have Phase III data coming up shortly. Maybe you could comment on what we should keep in mind or what you're looking for and how to put that into context? I'm sure there'll be a lot of focus on that and compare it to your data.

Enrique A. Conterno

CEO & Director

Very good. Thank you, Michael. I'm going to ask Elias to address the question on pamrevlumab in terms of enrollment, what actions are we taking, Elias? And also, could we have an interim look on both LAPC as well as IPF? And I'm going to ask then Peony to address the roxa questions.

Elias Kouchakji

Senior Vice President of Clinical Development, Drug Safety & Pharmacovigilance

Mike, thank you for your question. So first of all, as for the IPF study, we are accelerating the site activation in the U.S. -- not only in U.S., as globally. So we are actively very aggressively submitting all our CTAs and starting our European sites to be activated. Additionally, we are in more active contact with our sites, with our investigators. And we are more engaged with our community, the pulmonology community, and we are receiving a big interest. And a matter of fact, we are getting contacted, but some of these sites asking us about opening their sites for this study. So this is the first things we are doing at this time. And as you heard, this is going to be, again, the European studies. The second study is going to be activated.

Is the second part of your question is, can you remind me?

Michael Jonathan Yee

Jefferies LLC, Research Division

For pancreatic cancer, do you think you could get an interim on resection rate in 2021? Is that a very reasonable or achievable data point?

Elias Kouchakji

Senior Vice President of Clinical Development, Drug Safety & Pharmacovigilance

So we are -- similarly, we are aggressively are going after the sites in the way of rolling sites. We all started to receive the CTA approval in Europe at the same time, and we are pushing us hard as possible to enroll these patients as fast as possible. And just a reminder, this patient is not prescreened because you have to wait for the patient to be diagnosed or unresectable, locally advanced and resectable before they get treated. If they are already treated, they cannot be in this study. So we are doing everything as possible that you're able to achieve these milestones, and we are pushing very hard to -- we expanded and increased the number of our sites at the same time.

Enrique A. Conterno

CEO & Director

Michael, maybe I can add. We're not providing, at this time, timelines when it comes to enrollment. We intend to provide more detailed timelines in the second half of this year for all of our trials when it comes to pamrevlumab. We are looking at the resection rate as one of the possibilities for us to request a meeting with the FDA for an accelerated approval. And we'll provide more details on that in the second half of this year.

Michael Jonathan Yee

Jefferies LLC, Research Division

Perfect. And then on roxa?

Enrique A. Conterno

CEO & Director

Peony?

K. Peony Yu

Chief Medical Officer

Okay. Mike, thanks for the question. We are aware that there are -- there's another HIF-PHI program that may be disclosing their Phase III data this year. To address your questions, I wanted to remind ourselves that roxadustat is the only HIF-PHI program that already demonstrated positive efficacy and safety data. So without seeing competitors' data is difficult to compare who has better data. And we know that in -- when you conduct a clinical trial, especially in safety outcome trial, one could expect a variety of outcome. And we are -- we have demonstrated a very favorable benefit and risk ratio. Now, however, I could comment on the Phase III study design, that we have designed a program to demonstrate safety in comparison to placebo and with the hope and confidence of gaining clean safety label for non-dialysis. And then in -- and we -- in incident dialysis, which is a highly relevant in treating anemia in dialysis patients, we have demonstrated a 30% reduction in MACE risk and a 34% reduction in MACE+ risk.

Based on what I have seen on trial -- Clinicaltrials.gov, none of the HIF-PHI Phase III program have the sample size even near what we have, which is over 1,500 patients.

Operator

And our next question comes from Geoffrey Porges from SVB Leerink.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Quickly, Chris, could you talk a little bit more about the launch of roxadustat in China, particularly how much of a delay do you think that the circumstances there are posing to you? And when do you think we might start to see a reduction ramp up and particularly, when you think you'll be through getting on to the hospital formulary list, at least the major institutions?

And then just a little bit more on R&D. Enrique, you mentioned sort of investing in both CTGF and HIF biology to broaden the pipeline. But could you give us a sense of what the opportunities you see there are because many companies in your situation would be saying, we need to go to another area, we have pretty good molecules already. So what you see is the opportunity from further investments around the biology of those targets from the pipeline?

Enrique A. Conterno

CEO & Director

Very good. Chris, take us on China now, then try to address the R&D question.

Christine L. Chung

Senior Vice President of China Operations

Absolutely. Geoff, so I believe your first question was about the impact of the coronavirus. So as we all know, it's an evolving situation. And as we know, for the last 30 to 45 days, many things were shut down in China. Many companies are returning to work. And as reported earlier, our 2 factories are back to full normal operations. We were extremely encouraged by the uptake in listings in the early part of the year immediately after NRDL inclusion and before the coronavirus outbreak. We believe as China returns to normal operations, the momentum will be regained. As to when that's happened, I think your guess is as good as anybody else's. We are generally optimistic that we have the team in place and with the strength of the AstraZeneca sales and key accounts team and the strength of the product, we think we could regain the momentum very quickly once that happens.

I believe the second question you had, Geoff, was when will the demand uptake be seen and how are we doing in terms of listings, in particular with the major hospitals. So in terms of demand, that comes, obviously, after only if you're listed. And we believe demand would come naturally after listing. As to how big of that demand is, again, it depends on the rate of the listings that we are focusing on in 2020.

In terms of the major hospitals, as most innovative companies will tell you, there are approximately 6,000 major academic centers in China. Roxadustat is no different in terms of when we expect to complete listings. I think if you look at historic data for all the multinationals, it takes anywhere from 5 to 6 years to list all the hospitals. However, historically, it's been the case that it took a while after launch to gain entry into NRDL. We were fortunate enough that, that time frame was not long for roxadustat. And we are optimistic that we could finish listings in a time frame shorter than what was historically the benchmark for multinationals.

Enrique A. Conterno

CEO & Director

Thank you, Chris. Clearly, one of the areas, Geoff, that I have been quite impressed when coming to FibroGen, and this has been a very positive surprise, has been to see the level of understanding that we have when it comes to both HIF biology and CTGF biology. It is known that both, in particular, HIF is involved in a number of different diseases. So the opportunities for us to explore and leverage this is quite unique.

And then when it comes to CTGF, similarly, the application for CTGF are likely in the fibrosis and cancer areas. Now when speaking about research, I think the aim here is very clear. It is to develop new drug candidates to be able to have a sustainable stream of innovation based on these 2 scientific platforms, where we are the leading edge of understanding and signed. So I'm very excited about that. And we, once again, will be providing more details on this with a caveat, of course, that we might not be able to share everything that we know for -- it may not be in FibroGen's best interest. But we intend to do so, provide more feedback on our research and our agenda in the second half of this year.

Operator

And our next question comes from Andy Hsieh from William Blair.

Tsan-Yu Hsieh

William Blair & Company L.L.C., Research Division

Congratulations on all the progress worldwide. So I want to ask a clarifying question about kind of the change in the IPF studies. So just wanted to really understand what caused the change from a 1 study, large IPF study to a 2 -- kind of 2 identical studies? Is that kind of prompted by the regulators or what? Just wanted to understand that dynamic.

Enrique A. Conterno

CEO & Director

Very good. Thank you for your question. I'm going to have Elias address the question earlier. Elias, the question relates to what caused the change in the IPF program to go from 1 study to 2 studies?

Elias Kouchakji

Senior Vice President of Clinical Development, Drug Safety & Pharmacovigilance

So this was not triggered by any regulatory agency. This is triggered by our internal review and to take a look about the level of risk if it's going with a single study versus going with the 2 studies, that is most of the time is in the clinical development, the Phase III studies that you do 2 of them. And that will reduce the level of the statistical significance is required and this is any mishaps as this could be happening to reach that highly statistically significant. So when we assess that risk as we thought that there's a much better approaches to mitigate that risk. And at the same time, did not increase the size of the study tremendously. As you see, that is between the combined 2 studies versus 1 studies that the increase is manageable. That is the real reasons that for us as we move from 1 study into 2 studies.

We heard about this as a -- continuously previously about why we are doing single study. Is it riskier or not? And that is only as a step for a risk medication to ensure the success of the program.

Tsan-Yu Hsieh

William Blair & Company L.L.C., Research Division

Got it. And just a question on the potential Adcom. So just curious about the company's strategy. I know you guys have probably kind of preparing for that. Just the strategy or the plan of attack for the potential outcome, just given the fact that there's a lot of stakeholders, dialysis providers, CMS payers that might be watching very carefully at that, again, potential Adcom?

Enrique A. Conterno

CEO & Director

Very good. Yes, let me have Peony address the potential outcome for roxadustat. Peony?

K. Peonv Yu

Chief Medical Officer

Yes. So in our interaction with the FDA, there is no indication for an Adcom at this time. We will be -- we are preparing and will be well prepared if there is one. There are 3 possible time points that FDA may notify a sponsor of our Adcom, either before the NDA submission or at the time of initial -- 6 per 60 days of initial checklist before -- or by the time of the day 74 letter, where they inform the sponsor about NDA acceptance or any time during the FDA's review. And the final decision on Adcom or not really lies within the FDA.

Enrique A. Conterno

CEO & Director

Yes. And maybe just to add to Peony's response. Clearly, we are conducting a very thorough preparation regardless that we have not been given this indication or outcome. We have to prepare regardless. And in order to do that, we're following what is considered best practices for outcome preparation. Of course, we think about all stakeholders, but in particular, been able to address the questions that may come at the outcome. So that work is in progress.

Operator

And our next question comes from Joel Beatty from Citi.

Joel Lawrence Beatty

Citigroup Inc, Research Division

The first one is on the IPF Phase III program that switched from 1 trial to 2. Could you talk about how the powering of that Phase III program is affected from that switch? And do you anticipate that both Phase III trials will need to be successful? Or could the previous Phase II trial carry some weight as well?

Enrique A. Conterno

CEO & Director

Very good. Elias, the question is related to IPF and how is the powering effective, and whether both Phase III trials need to be successful. If you could address that.

Elias Kouchakji

Senior Vice President of Clinical Development, Drug Safety & Pharmacovigilance

Yes. So we powered this study to plan for success. So that is our first aim. So we maintain a, the study to be highly powered similarly to the first study that we planned, which is we're not changing anything in that study than the size of the patient and enroll in that study. So we will maintain a very high level of powering of the study. And we -- based on our analysis of all the data that we currently have from our Phase IIa and Phase IIb studies. And we're taking in consideration is the available data and IPF from this other study that led to the approval of the other 2 product in perfenidone. So we combined all this data and that was the basis for our powering of our strategy. So I hope this has answered your question.

Joel Lawrence Beatty

Citigroup Inc, Research Division

Yes.

Enrique A. Conterno

CEO & Director

Yes. Thank you, Elias. Maybe I can also complement Elias' question. Joe, clearly, the change that we're making is to increase the likelihood of success for -- and yes, we are expecting both Phase III trials need to be successful. We need both trials to be successful for us to have a successful program.

Joel Lawrence Beatty

Citigroup Inc, Research Division

Understood. And then if I could ask one other question on roxadustat. Could you tell us about the launch preparations that are underway, particularly anything unique for the type of drug that it is, such as to TDAPA payment agreements or agreements with dialysis providers?

Enrique A. Conterno

CEO & Director

Yes. Let me try to address that question. Clearly, we are working on preparations for launch in the U.S. Really, we have a great partner in AstraZeneca that is leading that effort. And we will complement AstraZeneca when it comes to medical affairs and our science to ensure that we have a highly successful launch. Clearly, there are many aspects that one has to prepare for when it comes to U.S. launch.

And you're making comments about TDAPA. As you know, CMS, every year updates, what is called the end-stage renal disease prospective payment system, or commonly known as the bundle. This rule has continued to evolve and now has a policy that provides for this add-on payment, TDAPA, which basically provides a payment for drugs that otherwise would be included in the band. We clearly are looking when it comes to the dialysis segment at making sure that we're fully prepared and being -- it is always difficult to say how the rule will continue to evolve. But I, based on our discussion with the CMS, we believe that we're in a very good position. We also are looking to, of course, the non-dialysis-dependent segment. And as you know, we have, of course, patients that are covered through Medicare, in particular, Part D. And also patients on Medicaid and also patients on commercial insurance. So we are -- we need to make sure that at the end of the day, this product is going to be reimbursed broadly, and we are -- AstraZeneca is leading the charge to ensure that it is going to be the case.

Operator

And our next question comes from Paul Choi from Goldman Sachs.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

I want to ask with regards to the Phase III for roxa and MDS. There is a company facing a PDUFA hearing about to commercialize a drug for anemia of MDS and potentially in the not-too-distant future. So I was just wondering, as you think about the Phase III trial design, can you maybe just clarify for us, is

there an interim built-in where you do -- if you do see an adequate separation with regard to transfusion independence rates at interim? Is that something you could stop the early trial -- the trial early on? And then I had a follow-up.

Enrique A. Conterno

CEO & Director

Peony, could you address the question on MDS competition, and will we have an interim?

K. Peony Yu

Chief Medical Officer

Yes. Happy to. Thanks for the question, Paul. So we have paid 2 parts to our Phase III study in patients with MDS anemia. We have disclosed the first part, which is the open-label lead-in component and presented that positive result at ASH in 2019. The rest of the study is double-blind, placebo-controlled. And at this time, we do not have a plan for interim analysis. Now in terms of comment on the competition of the -- I believe that you must be referring to luspatercept, Paul, right?

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Yes. That's correct.

K. Peony Yu

Chief Medical Officer

Yes. It is a drug with a different mechanism of action. And that program is targeting only patients. MDS patients with ring deposits -- with ring sideroblast, RS positive, whereas our program does not have that restriction. And also, our agent is a HIF-PHI, and it is orally available. And while as the other drug is parenterally-administered. So they are -- those are some of the very obvious differences. And this is an area of a great unmet medical need, and we feel very comfortable wanting to, and could pursue this program and confident in the successful unit.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Great. And then just as a follow-up for pamrevlumab, specifically with regard to DMD. I know that you've disclosed which aspects of the program are advancing, but are you thinking maybe about a potential broader development program here and any other subpopulations? Any color there you could offer would be great.

Enrique A. Conterno

CEO & Director

So Elias, I think the question is here related to pamrevlumab in DMD. And if you could provide maybe some color on the broader program. Are we looking at other subpopulations as well?

Elias Kouchakji

Senior Vice President of Clinical Development, Drug Safety & Pharmacovigilance

So currently, as you know, our study is in non-ambulatory, and we're concentrating this discussion, Paul, about the non-ambulatory. At the same time, during our discussion with the agencies, we are talking about the ambulatory population and looking at -- to see that how the program will look like is if we add this population to our side. We are in, as we said, in progressing the discussion with the agencies, including the AMA, not only the FDA, and we can give way more guidance on this in following earnings calls. But at this time, this -- the first study that we are concentrating on is the non-ambulatory study.

Operator

And our next question comes from Difei Yang from Mizuho Securities.

Difei Yang

Mizuho Securities USA LLC, Research Division

Just a couple. So with regards to the Adcom meeting, in the case if one was to take place, how much advance notice do you expect to get?

Enrique A. Conterno

CEO & Director

Peony, do you want to address the question on the Adcom, what is the advance notice?

K. Peony Yu

Chief Medical Officer

Difei, I believe FDA usually gives at least 45 business days before the actual meeting.

Difei Yang

Mizuho Securities USA LLC, Research Division

Okay. And the next one is that as you're getting closer to commercialization, how you see or what's your current thinking with regards to -- for the DD setting, that CMS setting, whether the drug will be in the bundle or not in the bundle?

Enrique A. Conterno

CEO & Director

Yes, it is difficult. I'm going to try to address that question. Clearly, it is difficult to predict whether we're going to be in the bundle or not, but we are preparing for both scenarios by having discussions with CMS. If we were to be in the bundle, as we have described, we believe that roxa would be eligible for TDAPA and the drug, the add-on payment, which would be key under that type scenario.

Operator

Thank you. And now I would like to turn the call back over to Enrique Conterno for closing remarks.

Enrique A. Conterno

CEO & Director

Thank you very much. We appreciate everyone's participation in today's investor call and your interest in FibroGen. Please follow-up with our Investor Relations team if you have any questions we have not addressed on the call, and enjoy the rest of your day. Thank you very much.

Operator

Thank you. And ladies and gentlemen, this concludes today's conference call. Thank you for participating, you may now disconnect.

(zip code)

Registrant's telephone number, including area code: (415) 978-1200

Securities registered pursuant to Section 12(b) of the Act:

Title of each class	Trading Symbol	Name of each exchange on which registered
Common Stock, \$0.01 par value	FGEN	The Nasdaq Global Select Market

Securities registered pursuant to Section 12(g) of the Act:

None

Indicate by check mark if the registrant is a well-known seasoned issuer, as defined in Rule 405 of the Securities Act. Yes 🗷 No 🗆

Indicate by check mark if the registrant is not required to file reports pursuant to Section 13 or Section 15(d) of the Act. Yes \square No \square

Indicate by check mark whether the registrant: (1) has filed all reports required to be filed by Section 13 or 15(d) of the Securities Exchange Act of 1934 during the preceding 12 months (or for such shorter period that the registrant was required to file such reports), and (2) has been subject to such filing requirements for the past

Indicate by check mark whether the registrant has submitted electronically every Interactive Data File required to be submitted pursuant to Rule 405 of Regulation S-T (§ 232.405 of this chapter) during the preceding 12 months (or for such shorter period that the registrant was required to submit such files). Yes 🗷 No 🗆

Indicate by check mark whether the registrant is a large accelerated filer, an accelerated filer, a non-accelerated filer, a smaller reporting company, or an emerging growth company. See the definitions of "large accelerated filer," "accelerated filer," "smaller reporting company," and "emerging growth company" in Rule 12b-2 of the Exchange Act:

Large accelerated filer \square Accelerated filer Non-accelerated filer Smaller reporting company Emerging growth company П

If an emerging growth company, indicate by check mark if the registrant has elected not to use the extended transition period for complying with any new or revised financial accounting standards provided pursuant to Section 13(a) of the Exchange Act. \square

Indicate by check mark whether the registrant is a shell company (as defined in Rule 12b-2 of the Act). Yes 🗆 No 🗷

The aggregate market value of the voting and non-voting common equity held by non-affiliates of the registrant, computed by reference to the closing price as of the last business day of the registrant's most recently completed second fiscal quarter, June 30, 2019, was approximately \$2,463.8 million. Shares of Common Stock held by each executive officer and director and stockholders known by the registrant to own 10% or more of the outstanding stock based on public filings and other information known to the registrant have been excluded since such persons may be deemed affiliates. This determination of affiliate status is not necessarily a conclusive determination for other purposes.

The number of shares of common stock outstanding as of January 31, 2020 was 87,999,804.

DOCUMENTS INCORPORATED BY REFERENCE

Items 10, 11, 12, 13 and 14 of Part III of this Annual Report on Form 10-K incorporate information by reference from the definitive proxy statement for the registrant's 2020 Annual Meeting of Stockholders to be filed with the Securities and Exchange Commission pursuant to Regulation 14A not later than after 120 days after the end of the fiscal year covered by this Annual Report on Form 10-K.

FORWARD-LOOKING STATEMENTS

This Annual Report filed on Form 10-K and the information incorporated herein by reference, particularly in the sections captioned "Risk Factors," "Management's Discussion and Analysis of Financial Condition and Results of Operations" and "Business," contains forwardlooking statements, which involve substantial risks and uncertainties. In this Annual Report, all statements other than statements of historical or present facts contained in this Annual Report, including statements regarding our future financial condition, business strategy and plans and objectives of management for future operations, are forward-looking statements. In some cases, you can identify forward-looking statements by terminology such as "believe," "will," "may," "estimate," "continue," "anticipate," "contemplate," "intend," "target," "project," "should," "plan," "expect," "predict," "could," "potentially" or the negative of these terms or other similar terms or expressions that concern our expectations, strategy, plans or intentions. Forward-looking statements appear in a number of places throughout this Annual Report and include statements regarding our intentions, beliefs, projections, outlook, analyses or current expectations concerning, among other things, our ongoing and planned preclinical development and clinical trials, the timing of and our ability to make regulatory filings and obtain and maintain regulatory approvals for roxadustat, pamrevlumab and our other product candidates, our intellectual property position, the potential safety, efficacy, reimbursement, convenience clinical and pharmaco-economic benefits of our product candidates, the potential markets for any of our product candidates, our ability to develop commercial functions, our ability to operate in China, expectations regarding clinical trial data, our results of operations, cash needs, spending of the proceeds from our initial public offering, financial condition, liquidity, prospects, growth and strategies, the industry in which we operate and the trends that may affect the industry or us. We have based these forward-looking statements largely on our current expectations and projections about future events and financial trends that we believe may affect our financial condition, results of operations, business strategy and financial needs. These forward-looking statements are subject to a number of risks, uncertainties and assumptions described in the section of this Annual Report captioned "Risk Factors" and elsewhere in this Annual Report.

These risks are not exhaustive. Other sections of this Annual Report may include additional factors that could adversely impact our business and financial performance. Moreover, we operate in a very competitive and rapidly changing environment. New risk factors emerge from time to time, and it is not possible for our management to predict all risk factors nor can we assess the impact of all factors on our business or the extent to which any factor, or combination of factors, may cause actual results to differ materially from those contained in, or implied by, any forward-looking statements.

You should not rely upon forward-looking statements as predictions of future events. We cannot assure you that the events and circumstances reflected in the forward-looking statements will be achieved or occur. Although we believe that the expectations reflected in the forward-looking statements are reasonable, we cannot guarantee future results, levels of activity, performance or achievements. The forward-looking statements made in this Annual Report are based on circumstances as of the date on which the statements are made. Except as required by law, we undertake no obligation to update publicly any forward-looking statements for any reason after the date of this Annual Report or to conform these statements to actual results or to changes in our expectations.

This Annual Report also contains market data, research, industry forecasts and other similar information obtained from or based on industry reports and publications, including information concerning our industry, our business, and the potential markets for our product candidates, including data regarding the estimated size and patient populations of those and related markets, their projected growth rates and the incidence of certain medical conditions, as well as physician and patient practices within the related markets. Such data and information involve a number of assumptions and limitations, and you are cautioned not to give undue weight to such estimates.

You should read this Annual Report with the understanding that our actual future results, levels of activity, performance and achievements may be materially different from what we expect. We qualify all of our forward-looking statements by these cautionary statements.

PARTI

ITEM 1. BUSINESS

OVERVIEW

We are a leading biopharmaceutical company discovering, developing and commercializing a pipeline of first-in-class therapeutics. We apply our pioneering expertise in hypoxia-inducible factor ("HIF") and connective tissue growth factor ("CTGF") biology to advance innovative medicines for the treatment of anemia, fibrotic disease, and cancer.

Roxadustat, our most advanced product, is an inhibitor of HIF prolyl hydroxylase ("HIF-PH") that acts by stimulating the body's natural pathway of erythropoiesis, or red blood cell production.

In August 2019, roxadustat (China tradename: 爱瑞卓®) received marketing authorization in the People's Republic of China ("China") for the treatment of anemia caused by chronic kidney disease ("CKD") in non-dialysis-dependent patients. Roxadustat was approved in China for the treatment of anemia caused by CKD in dialysis-dependent patients in December 2018.

In September 2019, roxadustat (Evrenzo ®) was approved in Japan for the treatment of anemia associated with CKD in dialysis-dependent patients, and in January 2020, Astellas Pharma Inc. ("Astellas") submitted a supplemental New Drug Application ("NDA") in Japan for the treatment of anemia in non-dialysis CKD patients.

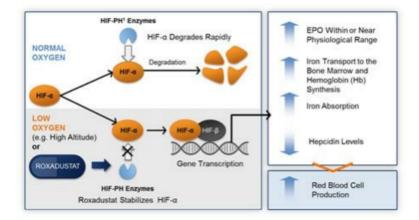

In conjunction with our collaboration partners, AstraZeneca AB ("AstraZeneca") and Astellas, we have completed the Phase 3 trials of roxadustat intended to support our NDA in the United States ("U.S.") and Marketing Authorization Application ("MAA") in the European Union and the United Kingdom ("Europe") for the treatment of anemia in CKD. Our NDA filing for roxadustat for the treatment of anemia in patients with dialysis-dependent CKD and in patients with non-dialysis-dependent CKD was accepted by the U.S. Food and Drug Administration ("FDA") in February, 2020. Astellas is in the process of preparing an MAA for submission to the European Medicines Agency ("EMA") in the second quarter of 2020 for the same indications. In addition, AstraZeneca has submitted applications for marketing approval of roxadustat in CKD anemia in Canada, Mexico, Taiwan, Philippines, and Singapore.

Beyond anemia in CKD, roxadustat is in Phase 3 clinical development in the U.S. and Europe and in Phase 2/3 development in China for anemia associated with myelodysplastic syndromes ("MDS"). We also began a Phase 2 clinical trial of roxadustat in the U.S. in chemotherapy-induced anemia ("CIA") in the third quarter of 2019.

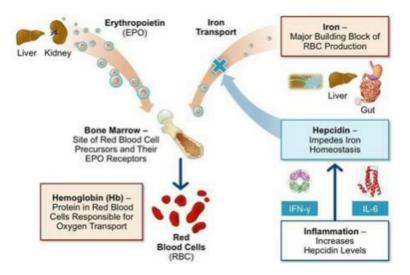

Pamrevlumab is our human monoclonal antibody that inhibits the activity of CTGF, a central mediator and critical common element in the progression of fibrotic and fibro-proliferative diseases. In 2019, we initiated a Phase 3 clinical program for the treatment of idiopathic pulmonary fibrosis ("IPF") and a Phase 3 clinical program for locally advanced unresectable pancreatic cancer. We also plan to initiate a Phase 3 program for the treatment of Duchenne muscular dystrophy ("DMD") in 2020.

ROXADUSTAT FOR THE TREATMENT OF ANEMIA IN CHRONIC KIDNEY DISEASE

Roxadustat is an orally administered small molecule that treats anemia by a mechanism of action that is different from that of erythropoiesis stimulating agents ("ESAs"). Roxadustat, as a HIF-PH inhibitor, relies on the natural mechanism by which the body responds to low oxygen levels. HIF is a transcription factor comprised of a HIF-alpha and a HIF-beta subunit, both of which are required to stimulate erythropoiesis. Under normal oxygen conditions, the HIF-alpha subunit is targeted for rapid degradation through the activity of a family of HIF-PH enzymes. However, under low oxygen conditions, the HIF-PH enzymes cannot function and HIF-alpha accumulates. HIF-alpha then combines with HIF-beta, and the newly formed HIF complex initiates transcription of a number of genes involved in the erythropoietic process, which ultimately leads to increased oxygen delivery to tissues. Roxadustat works by reversibly inhibiting the HIF-PH enzymes, thus mimicking this coordinated natural erythropoietic response through genes encoding the proteins involved in iron absorption, mobilization and transport as well as stimulation of red blood cell progenitors.

The coordinated erythropoiesis activated by roxadustat includes both the stimulation of erythroid maturation, by increasing the body's production of erythropoietin ("EPO"), and an increase in iron availability for hemoglobin synthesis in part through a decrease in hepcidin levels, which is particularly important in patients with inflammation. Patients taking roxadustat typically have a transient increase in circulating endogenous EPO levels at peak concentration within or near the physiologic range naturally experienced by humans adapting to hypoxic conditions such as at high altitude, following blood donation, or impaired lung function, such as pulmonary edema.

By contrast, ESAs act only to stimulate erythroid maturation without a corresponding increase in iron availability, and are typically dosed at well above the natural physiologic range of EPO. The sudden demand for iron stimulated by ESA-induced erythropoiesis can lead to functional or absolute iron deficiency. We believe these high doses of ESAs are a main cause of the significant safety issues that have been attributed to this class of drugs. In addition, the lack of a coordinated increase in iron availability with ESAs may explain the hyporesponsiveness of patients with inflammation to this class of drugs. It also explains why patients taking ESAs need more IV iron supplementation and red blood cell transfusions than patients taking roxadustat do. Not only are IV iron and blood transfusions more costly than oral iron, but both are also associated with increased risk of hospitalization and death.

In contrast, the differentiated mechanism of action of roxadustat, which involves induction of the body's own natural pathways to achieve a more complete erythropoiesis, has the potential to provide a safer and more effective treatment of anemia, including in the presence of inflammation, which normally limits iron availability.

Background of Anemia in Chronic Kidney Disease

Chronic kidney disease is a progressive disease characterized by gradual loss of kidney function that may eventually lead to kidney failure or end-stage renal disease ("ESRD") requiring dialysis or a kidney transplant to survive. CKD affects 12% to 14% of the global adult population. CKD is more prevalent in developed countries, but is also growing rapidly in emerging markets such as China.

Anemia can be a serious medical condition in which patients have insufficient red blood cells and low levels of hemoglobin, a protein in red blood cells that carries oxygen to cells throughout the body. Anemia in CKD is associated with increased risk of hospitalization, cardiovascular complications and death, and frequently causes significant fatigue, cognitive dysfunction, and considerable reduction of quality of life.

Anemia is a complication of chronic kidney disease and becomes increasingly common as the disease advances. In the U.S., approximately 18 million adults have CKD Stages 3-5. Based on literature and market research, we estimate 25%, 50%, and 55% of CKD non-dialysis patients in Stages 3, 4, and 5, respectively, have anemia. This translates to an estimated 4.9 million CKD non-dialysis anemia patients, and we estimate that up to 50% may be addressable based on our expected label. Additionally, 90% of CKD patients on dialysis in the U.S., or approximately 0.5 million, have anemia.

When ESAs were introduced in 1989, they dramatically reduced the need for blood transfusions in CKD patients, which was a material development since transfusions reduce the patient's opportunity for a kidney transplant and increase the risk of infections and complications such as heart failure and allergic reactions. However, multiple randomized clinical trials with ESAs suggested safety risks of ESA therapies, and as a result, the anemia guidelines and approved labels have changed to more restrictive use of ESAs. In the U.S., while 93% of dialysis patients receive ESAs, in contrast, the percentage of patients who are on one or more ESAs at the time of dialysis initiation declined from 30% in 2006 to 13.6% in 2017, despite the well-recognized health risks of untreated anemia.

In addition to the safety concerns, which may be a greater impediment in the non-dialysis setting, other factors which contribute to the undertreatment of anemia in non-dialysis patients are related to the form of administration and accessibility of ESA products. ESAs are administered by infusion or subcutaneous injections, which is more difficult outside of dialysis centers or nephrology practices where non-dialysis patients are typically treated.

In the dialysis-dependent population, most patients start receiving ESAs when the patient is transitioning to dialysis care. Patients face significant increased risk of death, cardiovascular events and hospitalizations during the first year on dialysis, and concurrently initiating anemia therapy adds complexity and safety risks. In addition, patients at an advanced stage CKD are often affected by chronic inflammation that leads to functional iron deficiency, requiring IV iron, and reduced effectiveness of ESAs.

The Market Opportunity for Roxadustat

We believe there is a significant opportunity for roxadustat, a potentially safer and more effective anemia treatment, to address markets currently served by injectable ESAs. According to IQVIA MIDAS™ reports, global ESA sales in all indications totaled \$7.5 billion in 2018, driven primarily by \$5.4 billion sold in the U.S. and Europe, mostly for treatment of anemia in CKD. We further believe that the number of patients requiring anemia therapy will grow steadily as the global CKD population and access to dialysis care continue to expand, particularly in China and other emerging markets including the rest of Asia, Latin America, Eastern Europe, the Middle East, and the Commonwealth of Independent States. In addition, obesity, hypertension, and diabetes prevalence continue rising, and the mortality of ESRD patients is declining, particularly in many emerging markets.

Furthermore, we believe there is a significant opportunity for roxadustat to address patient segments that are currently not effectively served by ESAs, such as anemia in non-dialysis CKD due to under-diagnosis of CKD and under-treatment of anemia in this population. Awareness of health consequences and the burden of CKD may also improve the diagnosis rate of CKD, and thus anemia of CKD.

Recently Completed Roxadustat Phase 3 Clinical Program in CKD Anemia

The table below summarizes the basis of our roxadustat U.S. NDA and planned MAA filing in Europe. Our NDA filing was accepted by the FDA in February 2020 for CKD anemia in both dialysis and non-dialysis patients. The FDA has set a Prescription Drug User Fee Act goal date of December 20, 2020. We expect Astellas to submit the MAA in Europe in the second quarter of 2020.

Pooled Efficacy Results in Non-Dialysis Patients

Superior at Raising Hemoglobin

Roxadustat superiority in efficacy was demonstrated in pooled efficacy analyses across the three Phase 3 dialysis-dependent studies and the three non-dialysis-dependent studies.

In the non-dialysis pool (4,277 patients from OLYMPUS, ANDES, and ALPS), the mean change in hemoglobin (from baseline to the average between Weeks 28-52) in roxadustat patients was also significantly larger than in placebo patients (1.85 g/dL vs. 0.13 g/dL, p<0.001).

Efficacy at Raising Hemoglobin Irrespective of Iron Replete Status

In the non-dialysis pool, roxadustat increased hemoglobin (by 1.94 g/dL) regardless of whether patients were iron-replete (patients shown to have sufficient baseline stores of iron in their body, TSAT \geq 20% and Ferritin \geq 100 ng/mL) or not iron-replete.

Reduction In Risk of Rescue Therapy and Transfusion

The risk of rescue therapy (blood or red blood cell transfusion, ESA use, or IV iron) was significantly lower in the roxadustat arm (8.9%) than the placebo arm (31.1%) in the pooled non-dialysis patients with a hazard ratio ("HR") = 0.19 (95% confidence interval "95% CI" of 0.16, 0.23), p<0.0001. The percentage of patients receiving red blood cell transfusions during the first year of treatment was also significantly lower in the roxadustat arm (5.2%) as compared to the placebo arm (15.4%) (HR (95% CI) = 0.26 (0.21, 0.32), p<0.0001).

Reduction of Decline in Kidney Function as Measured by eGFR

In a post hoc subgroup analysis of 2,438 non-dialysis patients with baseline eGFR≥15, the one-year decline in estimated glomerular filtration rate ("eGFR," a measure of the filtration function of kidney and renal disease progression) in roxadustat-treated patients (-2.8) was lower than that in placebo treated patients (-4.4), with a treatment difference of 1.6 mL/min/1.73m 2.

Reduction of LDL Cholesterol

In the pooled non-dialysis patients, roxadustat lowered low-density lipoproteins ("LDL"), with a mean change from baseline of -17.06 mg/dL compared to an increase of 1.30 mg/dL for placebo patients, a significant treatment difference of -19.83 mg/dL (p<0.0001).

Improvements in Quality of Life Measures

We have also observed improvements in quality of life. In the pooled analysis from the three non-dialysis studies, we observed statistically significant improvements from baseline to Week 12 in quality of life endpoints, including SF-36 Vitality subscale (p=0.0002), SF-36 Physical Functioning subscale (p=0.0369), FACT-AN Anemia subscale (p=0.0012), FACT-AN Total score (p=0.0056), and EQ-5D-SL VAS score (p=0.0005) when comparing roxadustat to placebo in CKD patients not on dialysis.

Pooled Efficacy Results in Dialysis Patients

Superior at Raising Hemoglobin

In the pooled dialysis studies (3,857 patients from HIMALAYAS, SIERRAS, and ROCKIES) the mean change in hemoglobin (from baseline to the average between Weeks 28-52) in roxadustat patients was significantly larger than in epoetin alfa patients (1.22 g/dL vs. 0.99 g/dL, p<0.001).

Efficacy at Raising Hemoglobin in Patients with Inflammation

In a subgroup of dialysis patients with inflammation (C-reactive protein ("CRP") levels over 4.9 mg/L), the mean change in hemoglobin (from baseline to the average between Weeks 28-52) was significantly higher in roxadustat-treated patients (1.29 g/dL) than epoetin alfa treated patients (0.96 g/dL, p<0.0001).

Lower Intravenous ("IV") Iron Requirements

In the dialysis pool, less mean monthly IV iron supplementation was required at Weeks 28-52 in patients receiving roxadustat versus patients receiving epoetin alfa in pooled analysis, p< 0.0001.

Reduction In Transfusion Risk

In the dialysis pool, during the first year of treatment, patients in the roxadustat arm had a lower transfusion risk (9.5%) as compared to the epoetin alfa arm (12.8%) (HR (95% CI) = 0.82 (0.679, 0.997), p=0.046).

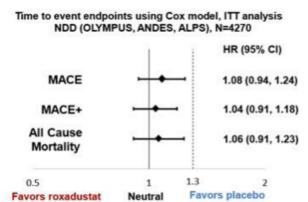

Pooled Cardiovascular Safety Results

In the U.S., the primary safety endpoint is time to first Major Adverse Cardiovascular Event ("MACE"), a composite endpoint of all-cause mortality, stroke and myocardial infarction. In Europe, the primary safety endpoint is the time to first MACE+ ("MACE+") which, in addition to the components in MACE, also includes hospitalization due to heart failure or unstable angina. However, the FDA in the U.S., and the EMA in Europe, will each review MACE, MACE+, and all-cause mortality separately, in addition to other endpoints.

The below cardiovascular safety analyses reflect the pooling strategy and analytical approach we agreed on with the FDA. Similar sets of analyses will be submitted to the EMA to serve as the basis for potential approval in dialysis and non-dialysis in Europe, and additional supportive analyses and sensitivity analyses as well as subgroup analyses were also included in the NDA and will be included in the MAA. However, the FDA and EMA will each conduct their own benefit-risk analysis and may use additional statistical analyses other than those agreed with the FDA or set forth below.

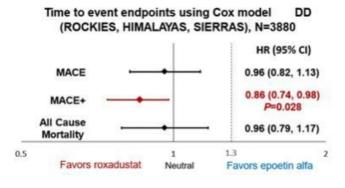

Non-Dialysis - Pooled Cardiovascular Safety Data

In our pre-NDA meeting, the FDA agreed that the intent-to-treat analyses followed for long-term safety results would be our primary cardiovascular safety analysis method for non-dialysis in the U.S. as it uses on-treatment and post treatment long term follow-up (until a common study end date) to account for the higher drop-out rate in the placebo arm. The figure below shows that in the 4,270 pooled non-dialysis patients (OLYMPUS, ANDES, and ALPS), the risk of MACE, MACE+, and all-cause mortality in roxadustat patients were comparable to that in placebo patients based on a reference non-inferiority margin of 1.3.

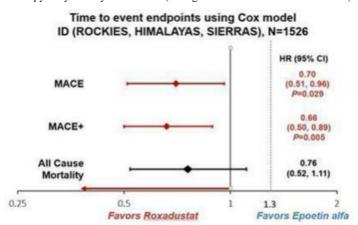

Dialysis - Pooled Cardiovascular Safety Data

In the pooled on-treatment analysis of 3,880 dialysis patients (HIMALAYAS, SIERRAS, and ROCKIES), the risk of MACE and all-cause mortality in roxadustat patients were not increased (based on a reference non-inferiority margin of 1.3), and roxadustat lowered the risk of MACE+ by 14% compared to the active comparator epoetin alfa, based on a hazard ratio of 0.86 and an upper bound of 95% CI under 1.0. The hazard ratios represent a point estimate of relative risk.

Incident Dialysis Subgroup - Pooled Cardiovascular Safety Data

In this program, incident dialysis patients are those who started participation in roxadustat Phase 3 studies within their first four months of dialysis initiation. In this clinically important subgroup of 1,526 incident dialysis patients, roxadustat reduced the risk of MACE by 30% and MACE+ by 34%, with a trend towards lower all-cause mortality. The lower MACE and MACE+ risks (compared to epoetin alfa) are based on hazard ratios of 0.70 and 0.66, respectively, with the upper bound of 95% CI under 1.0 in both. We believe this incident dialysis subpopulation is the appropriate setting for comparison of roxadustat versus epoetin alfa since most incident dialysis patients were ESA-naïve or have had only limited exposure to ESAs prior to study entry. In addition, the initiation of anemia therapy in this incident dialysis subgroup resembles clinical practice as the vast majority of US patients start anemia therapy early in dialysis treatment (during the first four months of treatment).

Non-Dialysis CKD Patients (ANDES) - FibroGen

ANDES is a 922-patient Phase 3, randomized, double-blinded, placebo-controlled trial designed to evaluate the efficacy and safety of roxadustat vs. placebo for the treatment of anemia in patients with later stage CKD (Stages 3, 4 or 5) who are not dialysis-dependent.

U.S. primary efficacy endpoint: roxadustat was superior to placebo in mean hemoglobin change from baseline to the average over Weeks 28 to 52 (2.00 vs. 0.16 g/dL, respectively, p<0.0001).

Europe primary efficacy endpoint: a higher proportion of roxadustat-treated patients (86.0%) achieved a hemoglobin response (defined as achieving a hemoglobin level of at least 11 g/dL on two consecutive visits during the first 24-weeks of treatment and a hemoglobin increase of at least 1.0 g/dL in subjects with baseline hemoglobin >8.0 g/dL, or an increase of at least 2.0 g/dL in subjects with baseline hemoglobin \leq 8.0 g/dL), as compared to placebo (6.6%), p<0.0001.

The proportion of subjects who received any rescue therapy (blood/red blood cell transfusion, ESA use, or IV iron) in the first 52 weeks of treatment was 8.9% in the roxadustat arm vs. 28.9% in the placebo arm (HR (95% CI) = 0.19 (0.138, 0.276), p<0.0001). The proportion of subjects who received blood/red blood cell transfusion in the first 52 weeks of treatment was 5.6% in the roxadustat arm vs. 15.4% in the placebo arm (HR (95% CI) = 0.26 (0.165, 0.406), p<0.0001).

The mean change in LDL cholesterol from baseline to average over Weeks 12-28 was -18.48 mg/dL (n=564) in the roxadustat arm vs. 0.22 mg/dL (n=269) in the placebo arm, with a treatment difference of -17.26 mg/dL (p<0.0001).

In this study, roxadustat-treated patients had a sustained reduction in hepcidin whereas placebo patients did not have a reduction in hepcidin. The mean change from baseline to Week 44 was $-22.1\mu g/L$ in the roxadustat arm vs. $3.88 \mu g/L$ in the placebo arm, for a treatment difference between the two arms of $-25.71 \mu g/L$ (95% CI: -38.523, -12.903).

In this study, subjects in the roxadustat arm had a substantially higher overall study drug exposure compared to subjects in the placebo arm. Study drug discontinuation was higher in the placebo arm compared to roxadustat arm, and the relative difference in discontinuation rates was especially pronounced in the lowest baseline eGFR category. The overall exposure-adjusted safety profile of roxadustat observed during this study was comparable with placebo and consistent with that expected in the CKD study population. The most commonly reported adverse events with roxadustat in this trial were nausea, hyperkalemia, constipation, and hypertension.

Non-Dialysis CKD Patients (ALPS) - Astellas

ALPS is Astellas' Phase 3, randomized, double-blind, placebo-controlled study of the efficacy and safety of roxadustat for the treatment of anemia in CKD in 597 patients not on dialysis. The trial met its primary endpoints by demonstrating superiority in efficacy vs. placebo in terms of hemoglobin change from baseline at Weeks 28 to 52 (1.988 for roxadustat vs 0.406 for placebo, p<0.001).

Roxadustat was superior to placebo in its ability to lower LDL from baseline with an LS mean difference of -0.701 mmol/L (95% CI: -0.83, -0.57). Roxadustat was superior to placebo in delaying the need for rescue therapy (HR (95%CI) = 0.238 (0.17, 0.33), p<0.001).

The safety profile observed in this study was in line with the expected event profile in non-dialysis patients. Common adverse events in both treatment groups were ESRD, hypertension, peripheral edema, and decreased glomerular filtration rate.

Non-Dialysis CKD Patients (OLYMPUS) - AstraZeneca

OLYMPUS is AstraZeneca's Phase 3, randomized, double-blinded, placebo-controlled trial designed to evaluate the efficacy and safety of roxadustat vs. placebo for the treatment of patients with anemia in CKD Stages 3, 4 or 5 whose disease progression is moderate to severe and who are non-dialysis-dependent. The trial in 2,781 patients met its primary efficacy endpoint by demonstrating a statistically-significant improvement in mean change from baseline in hemoglobin levels averaged over Weeks 28 to 52 (1.75 g/dL) as compared with Placebo (0.40 g/dL).

Roxadustat also improved hemoglobin levels from baseline in a subgroup of patients with inflammation (CRP>5 mg/L), with a statistically significant mean increase of 1.75 g/dL, compared to 0.62g/dL with placebo.

Overall safety findings are generally consistent with the non-dialysis patient population. For all patients, the most commonly reported adverse events in the intent-to-treat analysis set were ESRD, pneumonia, urinary tract infection and hypertension.

Stable Dialysis CKD Patients (PYRENEES) - Astellas

PYRENEES is Astellas' Phase 3, randomized, active-controlled trial designed to assess the efficacy and safety of roxadustat vs. epoetin alfa or darbepoetin alfa, for the treatment of anemia in 838 patients with CKD who are dialysis-dependent. The trial met its primary efficacy endpoint: roxadustat was considered non-inferior to ESAs based on the mean change from baseline in average hemoglobin levels at Weeks 28 to 52 (0.397 vs 0.183; non-inferiority margin = -0.75).

Roxadustat was superior to ESAs in its ability to lower LDL from baseline with an LS mean difference of -0.377 mmol/L (95% CI: -0.451, -0.304). Roxadustat was superior to ESAs in reducing the need for monthly IV iron use (LS mean difference (95%CI) = -31.9 mg (-41.4, -22.4), p<0.001).

The safety profile observed in this study was in line with the expected event profile in dialysis patients. There was a greater proportion of deaths in the roxadustat treatment group compared with the ESA group; however, the study was not powered to assess risk of MACE events or death, as compared to the pooled analysis above. Common adverse events in both treatment groups were hypertension, arteriovenous fistula thrombosis, headache, and diarrhea.

Stable and Incident Dialysis CKD Patients (ROCKIES) - AstraZeneca

ROCKIES is AstraZeneca's Phase 3, randomized, open-label, active-controlled trial designed to assess the efficacy and safety of roxadustat vs. epoetin alfa, for the treatment of anemia in patients with CKD who are dialysis-dependent. The trial in 2,133 patients met its primary efficacy endpoint by demonstrating a statistically-significant improvement in mean change from baseline in hemoglobin levels averaged over Weeks 28 to 52 (0.77 g/dL) compared with epoetin alfa (0.68 g/dL).

Roxadustat also improved hemoglobin levels from baseline in a subgroup of patients with inflammation (CRP>5 mg/L, demonstrating a statistically significant improvement with a mean increase of 0.80 g/dL compared to 0.59 g/dL with epoetin alfa. Patients treated with roxadustat used less monthly IV iron (mean = 59mg) compared to those treated with epoetin alfa (mean = 91mg) from Week 36 to the end of the study.

Adverse events with roxadustat were generally similar to those seen in patients treated with epoetin alfa and commonly found in dialysis patients. In roxadustat-treated patients, the most commonly reported adverse events were diarrhea, hypertension, pneumonia, headache, and arteriovenous fistula thrombosis.

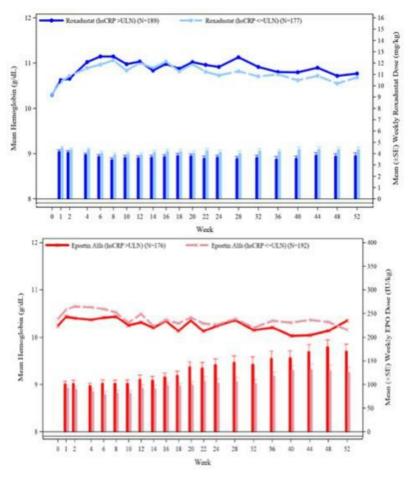

Stable and Incident Dialysis CKD Patients Study (SIERRAS) - FibroGen

SIERRAS is a 741-patient U.S. Phase 3, randomized, open-label, active-controlled trial to assess the efficacy and safety of roxadustat compared to epoetin alfa for the treatment of anemia in dialysis CKD patients who were receiving stable doses of ESA prior to study participation.

U.S. primary efficacy endpoint: the mean hemoglobin change from baseline to the average over Weeks 28 to 52 was 0.39 g/dL (roxadustat) vs. -0.09 g/dL (epoetin alfa), a least squares mean treatment difference of 0.48 g/dL (95% CI 0.37, 0.59). Roxadustat met the non-inferiority criteria as the lower bound of 95% CI was well above the non-inferiority margin of -0.75 g/dL. Roxadustat also achieved superiority, p<0.0001.

Europe primary efficacy endpoint: the mean hemoglobin change from baseline to the average over Weeks 28 to 36 was 0.54 g/dL (roxadustat) vs. -0.03 g/dL (epoetin alfa), a least squares mean treatment difference of 0.55 g/dL with a 95% CI (0.40, 0.69). Roxadustat met the non-inferiority criteria as the lower bound of the 95% CI was well above the non-inferiority margin of -0.75 g/dL. Roxadustat also achieved superiority over epoetin alfa, p<0.0001.

As seen in the figures below, in patients with inflammation (CRP>4.9 mg/L), roxadustat doses for maintaining hemoglobin levels were comparable to those with normal CRP and were stable over time as the effect on hemoglobin was durable, whereas epoetin alfa patients required higher mean doses in patients with inflammation (CRP>4.9 mg/L), doses which increased by approximately 50% from baseline after about one year. In these patients with inflammation (CRP>4.9 mg/L) mean change in hemoglobin from baseline to Week 18-24 was 0.61 g/dL in roxadustat vs. -0.03 g/dL in the epoetin alfa group, p<0.0001.

Subjects in the roxadustat group received lower mean IV iron during Weeks 28 to 52 than subjects in the epoetin alfa group (p=0.00091). Roxadustat-treated patients had a greater reduction in hepcidin as compared to ESA-treated patients. Additionally, a lower proportion of subjects on roxadustat received a red blood cell transfusion during treatment than the epoetin alfa group (12.5% and 21.1%, respectively, p=0.0337), with reduction in red blood cell transfusion risk by 33% compared with epoetin alfa; HR (95% CI) = 0.67 (0.466, 0.970), p=0.0337.

Mean LDL cholesterol levels decreased in the roxadustat group from baseline to the average over Weeks 12 to 28 (-13.70 mg/dL) but increased in the epoetin alfa group (1.23 mg/dL) with a treatment difference of -14.67 mg/dL (p<0.0001).

The incidence of treatment emergent adverse events was comparable in the roxadustat and epoetin alfa arms and were generally consistent with those typically expected in study patient population of ESRD on chronic dialysis therapy. The most commonly reported adverse events with roxadustat in this trial were nausea, hypertension, vomiting, and hyperkalemia.

Incident Dialysis CKD Patients Study (HIMALAYAS) - FibroGen

HIMALAYAS is a 1,043-patient Phase 3 randomized, open-label, active-controlled trial to assess the efficacy and safety of roxadustat compared to epoetin alfa, an ESA, for the treatment of anemia in CKD patients who have newly initiated dialysis treatment for ESRD and have had minimal or no exposure to an ESA prior to study participation.

U.S. primary efficacy endpoint: the mean hemoglobin change from baseline to the average over Weeks 28 to 52 was 2.57 g/dL (roxadustat) vs. 2.36 g/dL (epoetin alfa), a least squares mean difference of 0.18 g/dL, with the 95% CI of (0.08, 0.29). The non-inferiority criteria was met as the lower bound of the 95% CI was well above the non-inferiority margin of -0.75 g/dL, and superiority over epoetin alfa was also achieved, p=0.0005. In subgroup analyses, roxadustat was also superior to epoetin alfa in hemoglobin change from baseline regardless of iron repletion and inflammation status.

Europe primary efficacy endpoint: a higher proportion of roxadustat-treated patients (88.2%) achieved a hemoglobin response (defined as achieving a hemoglobin level of at least 11 g/dL on two consecutive visits during the first 24-weeks of treatment and a hemoglobin increase of at least 1.0 g/dL in subjects with baseline hemoglobin >8.0 g/dL, or an increase of at least 2.0 g/dL in subjects with baseline hemoglobin \leq 8.0 g/dL), as compared to an 84.4% responder rate in the epoetin alfa arm, with the lower bound of the 95% CI (-0.7%, 7.7%) of the treatment difference in responder rate well above the non-inferiority margin of -15%.

Roxadustat-treated patients had a statistically significant reduction in hepcidin, a key regulator of iron metabolism, as compared to ESA-treated patients. Roxadustat was shown to increase hemoglobin regardless of baseline inflammation status.

The most commonly reported adverse events with roxadustat in this trial were hypertension, diarrhea, and muscle spasms. The safety profile of roxadustat in this study was consistent with results from prior roxadustat studies.

ROXADUSTAT FOR THE TREATMENT OF ANEMIA IN CHRONIC KIDNEY DISEASE IN CHINA

In August 2019, roxadustat (China tradename: 爱瑞卓®) received marketing authorization in China for the treatment of anemia caused by CKD in non-dialysis-dependent patients. Treatment for anemia caused by CKD in dialysis-dependent patients was approved in 2018.

In July 2019, results from our two China Phase 3 clinical trials were published in the New England Journal of Medicine.

In December 2019, roxadustat was included on the updated National Reimbursement Drug List ("NRDL") released by China's National Healthcare Security Administration. Roxadustat is included on the NRDL for the treatment of anemia in CKD.

Market Opportunity

The currently available forms of treatment in China for anemia in CKD include ESAs, oral iron, intravenous iron, traditional Chinese medicine, and combinations thereof. ESAs are the largest segment, which we estimate to be approximately \$275 million in sales, or approximately 80% of the total ESA market based on data from IQVIA China Hospital Pharmaceutical Audit. With the unique benefits of roxadustat to treat previously unaddressable patient populations, we believe the overall CKD anemia market will increase.

China is experiencing epidemiological changes in metabolic diseases due to economic development, urbanization and an aging population. Diabetes and hypertension are the leading causes of CKD in China, and rates have been growing over past two decades. We believe the increase in diabetes and hypertension prevalence will result in an increase of CKD anemia patients.

Dialysis-Dependent CKD

Based on the latest estimates and published data, we believe there are over 600,000 dialysis patients in China, making it the largest single-country dialysis population in the world. With the substantial growth rate of dialysis patients (over 10% per year from 2011 to 2017), the Ministry of Health and the Chinese Society of Nephrology have publicly recognized the need for further investment in dialysis infrastructure.

The prevalence rate of CKD dialysis patients that have anemia (defined as hemoglobin < 10g/dL) is estimated to be over 90%.

Dialysis treatment is delivered in the form of hemodialysis or peritoneal dialysis. In China, approximately 85% of dialysis patients with CKD are on hemodialysis. Hemodialysis is performed primarily in dialysis clinics within hospitals, most of which are publicly owned. This is in contrast to the U.S. where freestanding dialysis centers located outside of hospitals is common practice. With recent regulatory changes, the number of privately owned dialysis clinics is growing at a rapid pace, a trend that has provided additional capacity to meet the growing demand. The remaining 14-15% of CKD patients (approximately 100,000) are on peritoneal dialysis, which is self-administered at home by patients, a setting roxadustat, with its oral administration, is particularly well-suited for roxadustat. Peritoneal dialysis patients typically visit their nephrologists on a monthly basis at the hospital for monitoring and follow-up.

Non-Dialysis-Dependent CKD

We estimate that there are over 10 million Stage 3-5 non-dialysis CKD patients in China with anemia (defined as hemoglobin < 10g/dL). We believe the addressable population of non-dialysis patients with anemia (anemic patients that have been diagnosed and treated for CKD) is approximately 2-3 million, with 1-2 million in Stages 3 and 4 and 1 million in Stage 5 non-dialysis. This Stage 5 population that is dialysis-eligible but not receiving dialysis is characteristic of developing markets like China, and presents a particular opportunity for roxadustat, as many patients have severe anemia.

Unmet Medical Need and Roxadustat Differentiation in China

We believe there is a particularly significant unmet medical need for the treatment of anemia in CKD in China. Anemia is considered a risk multiplier for CKD patients and is commonly associated with increased rates of cardiovascular events, hospitalizations, CKD progression, and death. Several of the advantages that roxadustat, as an oral therapeutic, potentially offers over ESAs are particularly suited to address the unmet medical need in each of the three categories of CKD patients in China.

We believe there is chronic under-treatment of anemia within the CKD patient population on dialysis in China due in part to under-prescription of IV iron (often necessary for ESA treatment), and lack of efficacy in patients with inflammation. The most recent treatment guidelines published by the Chinese Society of Nephrology in 2018 recommended treatment to hemoglobin 11.0 g/dL to 12.0 g/dL. Even though over 70% of hemodialysis CKD patients, and approximately 60% of peritoneal dialysis CKD patients are treated with ESAs, based on the Chinese Renal Data System in 2015, less than 60% of dialysis patients reached 10.2 g/dL.

In the non-dialysis population and peritoneal dialysis population, only a small percentage of patients receive anemia treatment, and those who do, they receive only a minimal level of treatment, including patients who are eligible for dialysis and who have severe anemia. Roxadustat, as an oral medication, can be easily administered in any setting and stored at room temperature. Injectable drugs like ESAs present a challenge in China because even subcutaneous administration is performed at hospitals and not in the home, in part due to the difficulty in refrigeration and administration of injectable medicines. Frequent hospital visits, for the sole purpose of receiving injectable ESA treatment (as well as IV iron, which is often necessary with ESA treatment), can present a substantial logistical and financial burden to patients.

In the context of the rapidly growing China pharmaceutical market, we believe that the demand for anemia therapy will continue to grow as a result of an expanding CKD population, as well as the central government's mandate to make dialysis more available through government reimbursement and build-out of dialysis facilities. In addition, as the standard of living improves in China, the demand for access to innovative drugs increases. In this context, we believe that roxadustat is a particularly promising product for this market.

Commercialization

AstraZeneca is our commercialization partner for roxadustat in China. Under our collaboration agreement, AstraZeneca will lead commercialization activities and has responsibility for sales and marketing, and market access. FibroGen has responsibility for medical affairs, manufacturing (as the Marketing Authorization Holder), executing sales to distributors, and pharmacovigilance. FibroGen and AstraZeneca will work together to manage distribution.

Pricing and Reimbursement

In December 2019, roxadustat was included for the treatment of anemia in CKD on the updated NRDL released by China's National Healthcare Security Administration. The list is effective for a standard two-year period from January 1, 2020 to December 31, 2021. The negotiated price for a roxadustat 50 mg capsule is RMB 95. Roxadustat will be subject to price re-negotiation at the end of 2021.

We believe reimbursement is one of the two most critical market access factors for commercialization success in China, with the other being hospital listings. China is mostly a single-payor market with near universal healthcare provided by the government. Over 95% of the population receives healthcare coverage under one government-funded medical reimbursement plan or another, each with different levels of reimbursement. Commercial health insurance is available but is minimally adopted, and is seen as a supplement above and beyond government reimbursement.

Reimbursement for roxadustat will differ based on multiple factors including the CKD patient population (dialysis vs. non-dialysis), location, patient employment status, and if roxadustat is qualified into the "Critical Disease" or "Chronic Disease" insurance programs for such locations. We expect roxadustat reimbursement rates will be largely consistent with those ESAs listed on the NRDL. We believe in the next few years and in many parts of the country, dialysis patients will generally be reimbursed for 80-90% of their costs for roxadustat and non-dialysis patients in the 50-70% range.

Hospital Listing

Before roxadustat can be prescribed at a government hospital, which is 90% of the market in China, it has to be carried in the hospital formulary. The process of entry into the formulary is commonly referred to as "hospital listing". Decisions are made on a hospital-by-hospital basis, where hospital listing committees meet anywhere from every six months to every five years. Temporary listings can be used in the interim, where the head of the department could place an ad-hoc order with the formulary for a single or handful of patients for small quantities of roxadustat. These market access constraints impact all drugs, not just roxadustat. Consistent with the experience of other product launches in China, significant market uptake is usually seen a few years after launch, although in the case of roxadustat, it could be sooner given the inclusion in NRDL within 12 months of market approval.

Tendering

Tendering is a provincial level procedure. For drugs with multiple brands, it is a collective tender process for purchases by government hospitals of a medicine included in provincial or local medicine procurement catalogs. In the case of roxadustat, it is a more administrative process than for most drugs as roxadustat is currently the only drug of its class (HIF-PHI) available on the market. The tendering process of roxadustat is substantially complete in all 31 provinces in China.

ROXADUSTAT FOR THE TREATMENT OF ANEMIA IN CHRONIC KIDNEY DISEASE IN JAPAN

In September 2019, roxadustat (Evrenzo®) was approved in Japan for the treatment of anemia associated with CKD in dialysis patients. Our collaboration partner Astellas launched Evrenzo in November 2019, targeting healthcare providers that care for approximately 330,000 dialysis patients across Japan.

In January 2020, Astellas submitted a supplemental NDA in Japan for the treatment of anemia in non-dialysis CKD patients, supported by three clinical studies in more than 500 Japanese non-dialysis patients with anemia associated with CKD.

ROXADUSTAT FOR THE TREATMENT OF CHEMOTHERAPY-INDUCED ANEMIA AND ANEMIA ASSOCIATED WITH MYELODYSPLASTIC SYNDROMES

Based on roxadustat's mechanism of action and safety and efficacy profile to date, we believe it has the potential to treat anemia associated with many other conditions, including CIA and MDS.

Background of Chemotherapy-Induced Anemia

As blood cell production in bone marrow is highly prolific, it is particularly vulnerable to the cytotoxic effects of chemotherapy used to treat cancer patients. Many chemotherapy agents directly impair hematopoiesis in bone marrow, including disruption of red blood cell production. The nephrotoxic effects of some cytotoxic agents, such as platinum-containing agents, can also result in decreased production of erythropoietin by the kidneys, further contributing to reduced red blood cell production. Radiation therapy has also been associated with hematologic toxicity.

Approximately 40% of total solid tumor cancer patients, or approximately 6.8 million people, undergo chemotherapy each year globally, including 1.7 million in the U.S. and 3.2 million in China. Eighty percent of those patients in developed countries and 40% of patients in China develop CIA. The incidence and severity of CIA depend on a variety of factors, including the tumor type or the level of toxicity of the therapy, and further increases with each successive chemotherapy round. We believe the addressable population is approximately 600,000 in the U.S. and 500,000 in China.

ESAs have been recommended for patients experiencing CIA with the desirable goals of improvement in anemia-related symptoms and the avoidance of blood transfusion which increases risk of infections and the risk of complications such as heart failure and allergic reactions. However, not all CIA patients respond to ESA therapy, which may be due to the etiology of their CIA or inflammatory comorbidity. ESA use also has associated toxicities, including increased thrombotic events, possible decreased survival and accelerated tumor progression, as published from randomized clinical trials and meta-analyses, that led to label restrictions and box warnings for ESAs in cancer populations in 2007, followed by the ESA Risk Evaluation and Mitigation Strategy ("REMS") program.

Market Opportunity for Roxadustat in Chemotherapy-Induced Anemia

ESA sales for CIA dropped significantly in the U.S. since the reported safety risks of ESA use in cancer patients in 2006, from estimated \$2.5 billion in 2006 to less than \$0.5 billion in 2019. During the same period, the prevalence of diagnosed CIA remained at similar levels, and is expected to grow slightly as a marginal decline of chemotherapy use is offset by an aging population.

We believe that if our clinical program shows an acceptable safety and efficacy profile, roxadustat would have the potential to address anemia in this population of patients undergoing chemotherapy, including, potentially, those patients with concomitant inflammation.

Clinical Development of Roxadustat in Chemotherapy-Induced Anemia

We began a Phase 2 proof of concept clinical trial of roxadustat in the U.S. in CIA in the third quarter of 2019. This is a single-arm open label study investigating the efficacy and safety of roxadustat for the treatment of anemia in patients receiving myelosuppressive chemotherapy treatment for non-myeloid malignancies, with treatment duration of 16 weeks, and will enroll up to 100 patients.

Background of Anemia in Myelodysplastic Syndromes

Myelodysplastic syndromes are a diverse group of bone marrow disorders characterized by ineffective production of healthy blood cells and premature destruction of blood cells in the bone marrow, leading to anemia. In most MDS patients, the cause of the disease is unknown.

Incidence and prevalence of MDS are not yet well understood, and may be greatly underestimated. MDS diagnosis became reportable under the World Health Organization oncology classification system only in 2001, and since then cases of MDS have been tracked by cancer registries.

The prevalence of MDS in the U.S. is estimated to be between 60,000 and 170,000, and continues to rise as more therapies become available and patients are living longer with MDS. We estimate that currently, approximately 70,000 patients are diagnosed with MDS in the United States.

Anemia is the most common clinical presentation in MDS, seen in approximately 80% of MDS patients, and producing symptoms, including fatigue, weakness, exercise intolerance, shortness of breath, dizziness, and cognitive impairment.

Limitations of the Current Standard of Care for Anemia in Myelodysplastic Syndromes

Stem cell transplant is the only potentially curative therapy for MDS, but it is not feasible in most patients due to their advanced age and frailty. The high rate of severe anemia leaves recurring red blood cell transfusions as the mainstay of care in MDS patients. Transfusion can result in direct organ damage through transfusional iron overload. Transfusion dependent MDS patients suffer higher rates of cardiac events, infections and transformation to acute leukemia, and a decreased overall survival rate when compared with non-transfused patients with MDS, and decreased survival compared to an age-matched elderly population. Patients receiving red blood cell transfusions may require an iron chelator in order to address toxic elements of iron overload such as lipid peroxidation and cell membrane, protein, DNA, and organ damage.

Lower-risk MDS patients represent approximately 77% of total diagnosed MDS population. Most national and international guidelines recommend use of ESAs for anemia only in lower-risk MDS patients presenting with symptomatic anemia with serum EPO levels at or below 500 mU/mL.

Even among the eligible subpopulation, the effectiveness of ESAs in treating anemia in MDS remains limited, with the best clinical study results showing 40% to 60% erythroid response rates, in studies where significantly high doses of ESAs were used, enrolled patients had low serum EPO levels, and in lower-risk categories. New strategies to broaden the eligible population, improve anemia and maintain adequate iron balance, as well as avoidance of transfusions, are highly desired in managing patients with MDS.

Market Opportunity for Roxadustat in Myelodysplastic Syndromes

We believe there is a significant need for a safer, more effective, and more convenient option to address anemia in patients with lower-risk MDS. Roxadustat, our orally administered small molecule HIF-PH inhibitor, stimulates the body's natural mechanism of red blood cell production and iron hemostasis based on cellular-level oxygen-sensing and iron-regulation mechanisms. Unlike ESAs which are limited to providing exogenous EPO, roxadustat activates a coordinated erythropoietic response in the body that includes the stimulation of red blood cell progenitors, an increase in the body's production of endogenous EPO, and an increase in iron availability for hemoglobin synthesis, which we believe is important in a broad range of MDS patients. Moreover, in anemia of CKD, roxadustat has demonstrated the ability in clinical trials to increase and maintain hemoglobin levels in the presence of inflammation as measured by CRP, where ESAs have shown limited effect. We believe that we may be able to replicate this result in MDS anemia patients, where it is not uncommon for patients to present with autoimmune and inflammatory conditions.

Clinical Development of Roxadustat in Myelodysplastic Syndromes

We are conducting a Phase 3 placebo controlled, double-blind clinical trial to evaluate the safety and efficacy of roxadustat for treatment of anemia in MDS in the U.S. and Europe. We continue to enroll this 160-patient randomized, double-blind, placebo-controlled Phase 3 clinical study of roxadustat in transfusion-dependent, lower-risk MDS patients, in which subjects are randomized 3:2 to receive roxadustat or placebo three-times-weekly. The primary endpoint is the proportion of patients who achieve transfusion independence by 28 weeks with secondary endpoints and safety evaluated at 52 weeks.

In the open-label dose-finding component of this study, 24 lower-risk, transfusion dependent MDS patients with anemia were enrolled in three sequential starting dose cohorts (1.5 mg/kg, 2.0 mg/kg, and 2.5 mg/kg), with roxadustat doses adjusted every eight weeks per a pre-defined algorithm based on hemoglobin response. Best supporting care including red blood cell transfusion was allowed, as needed, per investigator's discretion. Patients treated with roxadustat achieved a greater than or equal to 8-week transfusion independence rate of 38% in the first 28 weeks and 54% of patients had greater than or equal to 50% reduction in red blood cell transfusion over any eight weeks, from baseline. Roxadustat was generally well tolerated in each dose cohort. The dose level of 2.5 mg/kg was selected as the starting dose for the double-blind component of the study.

In China, we continue to enroll the open-label portion of our Phase 2/3 clinical trial to evaluate the safety and efficacy of roxadustat in non-transfusion dependent, lower-risk MDS patients with anemia. After the open-label portion we expect to begin the 135-patient double-blind, placebo-controlled Phase 3 portion of the study, in which subjects will be randomized 2:1 to receive roxadustat or placebo three-times weekly for 26 weeks. The primary endpoint for this study is percentage of patients achieving a hemoglobin response.

Research at FibroGen

The HIF-PH enzymes that are the targets of roxadustat belong to a broader family of enzymes known as 2-oxoglutarate (2OG)-dependent oxygenases. In humans, this family comprises more than 60 members that play important roles in a diverse range of biological processes including collagen biosynthesis, oxygen sensing, epigenetic regulation, nucleic acid modification/repair, and lipid metabolism. The first members of this enzyme family to be characterized were the collagen prolyl hydroxylases, which play a critical role in the biosynthesis of collagen and as a result, are potential targets for the treatment of fibrotic disease. The HIF-PH enzymes regulate the stability of the HIF transcription factor, which not only has therapeutic relevance for the treatment of anemia as exemplified by roxadustat, but also has implications for other diseases where activation of the HIF pathway would be expected to have beneficial effects. Other members of the 2OG-dependent oxygenase family with relevance to human disease include the Jumonji domain-containing histone demethylases, which are emerging cancer targets.

The fact that all members of the 20G-dependent oxygenase enzyme family use 20G as a co-substrate makes them viable targets for small molecule inhibitors that compete with 20G. FibroGen has been a world leader in inhibition of enzymes belonging to this family, and, our internal medicinal chemistry efforts have generated a large library of novel compounds designed to target the 20G-dependent oxygenase family.

PAMREVLUMAB FOR THE TREATMENT OF FIBROSIS AND CANCER

We were founded to discover and develop therapeutics for fibrosis and began studying CTGF shortly after its discovery. Our accumulated discovery research efforts indicate that CTGF is a critical common element in the progression of serious diseases associated with fibrosis.

From our library of human monoclonal antibodies that bind to different parts of the CTGF protein and block various aspects of CTGF biological activity, we selected pamrevlumab, for which we have exclusive worldwide rights. We believe that pamrevlumab blocks CTGF and inhibits its central role in causing diseases associated with fibrosis. Our data to date indicate that pamrevlumab is a promising and highly differentiated product candidate with broad potential to treat a number of fibrotic diseases and cancers.

We are currently conducting Phase 3 studies in pancreatic cancer and IPF and a Phase 2 trial in DMD. In the U.S., the FDA has granted Orphan Drug Designation to pamrevlumab for the treatment of IPF, locally advanced unresectable pancreatic cancer, and DMD. In addition, the EMA has granted Orphan Medicinal Product Designation to pamrevlumab for the treatment of DMD. Pamrevlumab has also received Fast Track designation from the FDA for the treatment of both IPF and locally advanced unresectable pancreatic cancer.

Overview of Fibrosis

Fibrosis is an aberrant response of the body to tissue injury that may be caused by trauma, inflammation, infection, cell injury, or cancer. The normal response to injury involves the activation of cells that produce collagen and other components of the extracellular matrix ("ECM") that are part of the healing process. This healing process helps to fill in tissue voids created by the injury or damage, segregate infections or cancer, and provide strength to the recovering tissue. Under normal circumstances, where the cause of the tissue injury is limited, the scarring process is self-limited and the scar resolves to approximate normal tissue architecture. However, in certain disease states, this process is prolonged and excessive and results in progressive tissue scarring, or fibrosis, which can cause organ dysfunction and failure as well as, in the case of certain cancers, promote cancer progression.

Excess CTGF levels are associated with fibrosis. CTGF increases the abundance of myofibroblasts, a cell type that drives wound healing, and stimulates them to deposit ECM proteins such as collagen at the site of tissue injury. In the case of normal healing of a limited tissue injury, myofibroblasts eventually die by programmed cell death, or apoptosis, and the fibrous scarring process recedes.

Multiple biological agents and pathways have been implicated in the fibrotic process, many of which converge on CTGF, a central mediator of fibrosis. In the case of cancer, the sustained tumor-associated fibrotic tissue promotes tumor cell survival and metastasis. CTGF is a secreted glycoprotein produced by fibroblasts, endothelium, mesangial cells and other cell types, including cancers, and is induced by a variety of regulatory modulators, including TGF-\(\text{B}\) and VEGF. CTGF expression has been demonstrated to be up-regulated in fibrotic tissues. Thus, we believe that targeting CTGF to block or inhibit its activity could mitigate, stop or reverse tissue fibrosis. In addition, since CTGF is implicated in nearly all forms of fibrosis, we believe pamrevlumab has the potential to provide clinical benefit in a wide range of clinical indications that are characterized by fibrosis.

Until recently, it was believed that fibrosis was an irreversible process. It is now generally understood that the process is dynamic and potentially amenable to reversal. Based on studies in animal models of fibrosis of the liver, kidney, muscle and cardiovascular system, it has been shown that fibrosis can be reversed. It has also been demonstrated in humans that fibrosis caused by hepatitis virus can be reversed (Chang et al. Hepatology (2010)). Additionally, we have generated data in human and animal studies that lung fibrosis progression can be slowed, arrested, or possibly reversed in some instances upon treatment with pamrevlumab.

Clinical Development of Pamrevlumab - Overview

We have performed clinical trials of pamrevlumab in IPF, pancreatic cancer, liver fibrosis and diabetic kidney disease. In eleven Phase 1 and Phase 2 clinical studies involving pamrevlumab to date, including more than 600 patients who were treated with pamrevlumab (about half of patients dosed for more than six months), pamrevlumab has been well-tolerated across the range of doses studied, and there have been no dose-limiting toxicities seen thus far.

Idiopathic Pulmonary Fibrosis

Understanding IPF and Current Therapies

IPF is a form of progressive pulmonary fibrosis, or abnormal scarring, which destroys the structure and function of the lungs. As tissue scarring progresses in the lungs, transfer of oxygen into the bloodstream is increasingly impaired. Average life expectancy at the time of confirmed diagnosis of IPF is estimated to be between three to five years, with approximately two-thirds of patients dying within five years of diagnosis. Thus, the survival rates are comparable to some of the most deadly cancers. The cause of IPF is unknown but is believed to be related to unregulated cycles of injury, inflammation and fibrosis.

Patients with IPF experience debilitating symptoms, including shortness of breath and difficulty performing routine functions, such as walking and talking. Other symptoms include chronic dry, hacking cough, fatigue, weakness, discomfort in the chest, loss of appetite, and weight loss. Over the last decade, refinements in diagnosis criteria and enhancements in high-resolution computed tomography imaging technology ("quantitative HRCT") have enabled more reliable diagnosis of IPF without the need for a lung biopsy.

The U.S. prevalence and incidence of IPF are estimated to be 44,000 to 135,000 cases, and 21,000 new cases per year, respectively, based on Raghu et al. (Am J Respir Crit Care Med (2006)) and on data from the United Nations Population Division. We believe that with the availability of technology to enable more accurate diagnoses, the number of individuals diagnosed per year with IPF will continue to increase.

There are currently two therapies approved to treat IPF in Europe and the U.S., pirfenidone and nintedanib. The approvals and subsequent launches of pirfenidone and nintedanib have clearly shown the commercial potential in IPF. Hoffmann-La Roche ("Roche") reported worldwide sales of approximately \$1 billion for 2018 and \$1.15 billion for 2019 for Esbriet® (pirfenidone). Similarly, Boehringer Ingelheim Pharma GmbH & Co. KG ("Boehringer Ingelheim") reported total sales of approximately \$1 billion for Ofev® (nintedanib) in 2017, and approximately \$1.2 billion in 2018.

Phase 3 Clinical Development - Randomized, Double-Blind, Placebo-Controlled Trials of Pamrevlumab in IPF

We continue to enroll ZEPHYRUS, our double-blind, placebo-controlled Phase 3 trial of pamrevlumab in IPF patients. In 2020, we will initiate a second IPF study similar in design to ZEPHYRUS. Each study will target approximately 340 patients. The primary U.S. efficacy endpoint for each study is change from baseline in forced vital capacity ("FVC"). The primary efficacy endpoint in Europe for each study is disease progression (defined by a decline in FVC percent predicted of greater than or equal to 10% or death). Secondary endpoints will include clinical outcomes of disease progression, patient reported outcomes, and quantitative changes in lung fibrosis volume from baseline.

PRAISE - Study 067 - Randomized, Double-Blind, Placebo-Controlled Phase 2 Trial of Pamrevlumab in IPF

In September 2019, positive results from PRAISE, our randomized, double-blind, placebo-controlled Phase 2 clinical trial (Study 067), were published in *The Lancet Respiratory Medicine*. PRAISE was designed to evaluate the safety and efficacy of pamrevlumab in patients with mild-to-moderate IPF (baseline FVC percentage predicted of 55%), as well as topline results from two sub-studies that were added to evaluate the safety of combining pamrevlumab with approved IPF therapies.

In the double-blind, placebo-controlled 48-week portion of this study, 103 patients were randomized (1:1) to receive either 30mg/kg of pamrevlumab or placebo intravenously every three weeks. Lung function assessments were conducted at baseline and at Weeks 12, 24, 36 and 48. Quantitative HRCT assessments were performed at baseline and on Weeks 24 and 48.

Pamrevlumab met the primary efficacy endpoint of change of FVC percent predicted, a measure of a patient's lung volume as a percentage of what would be expected for such patient's age, race, sex and height. The average decline (least squares mean) in FVC percent predicted from baseline to Week 48 was 2.85 in the pamrevlumab arm (n=50) as compared to an average decline of 7.17 in the placebo arm (n=51), a statistically significant difference of 4.33 (p=0.0331, using a linear slope analysis in intent-to-treat population).

Pamrevlumab-treated patients had an average decrease (least squares mean) in FVC of 129 ml at Week 48 compared to an average decrease of 308 ml in patients receiving placebo, a statistically significant difference of 178 ml (p=0.0249, using a linear slope analysis in the intent-to-treat population). This represents a 57.9% relative difference. In addition, the pamrevlumab-treated arm had a lower proportion of patients (10%) who experienced disease progression (defined by a decline in FVC percent predicted of greater than or equal to 10% or death), than did the placebo arm (31.4%) at Week 48 (p=0.0103). The percentage of pamrevlumab patients who experienced disease progression and discontinued therapy was less than 15% of that in the placebo arm.

In this study, we measured change in quantitative lung fibrosis from baseline to Week 24 and Week 48 using quantitative HRCT. The pamrevlumab arm achieved a statistically significant reduction in the rate of progression of lung fibrosis compared to placebo using HRCT to measure quantitative lung fibrosis ("QLF"). The change in QLF volume from baseline to Week 24 for pamrevlumab-treated patients was 24.8 ml vs. 86.4 ml for placebo, with a treatment difference of -61.6 ml, p=0.009. The change in QLF volume from baseline to 48 weeks was 75.4 ml in pamrevlumab-treated patients vs. 151.5 ml in patients on placebo, with a treatment difference of -76.2 ml, p=0.038.

As in our previous open label Phase 2 study, a correlation between FVC percent predicted and quantitative lung fibrosis was confirmed at both Week 24 and 48 in this study.

We are not aware of any other IPF therapies that have shown a statistically significant effect on lung fibrosis as measured by quantitative HRCT analysis.

The treatment effects of pamrevlumab were demonstrated not only on change in FVC, a measure of pulmonary function and IPF disease progression, and change in fibrosis using quantitative HRCT, but pamrevlumab-treated patients also showed a trend of clinically meaningful improvement in a measure of health-related quality of life using the St. George's Respiratory Questionnaire (SGRQ) vs. a reduction in quality of life seen in placebo patients over the 48 weeks of treatment. The SGRQ quality of life measurement has been validated in chronic obstructive pulmonary disease. In the patients that were evaluated by the UCSD Shortness of Breath Questionnaire, pamrevlumab-treated patients had a significant attenuation of their worsening dyspnea in comparison to placebo.

Pamrevlumab was well-tolerated in the placebo-controlled study. The treatment-emergent adverse events were comparable between the pamrevlumab and placebo arms and the adverse events in the pamrevlumab arm were consistent with the known safety profile of pamrevlumab. In this study, as compared with the placebo group, fewer pamrevlumab patients were hospitalized, following an IPF-related or respiratory treatment-emergent adverse event, or died for any reason.

The double-blind, active-controlled combination sub-studies were designed to assess the safety of combining pamrevlumab with standard of care medication in IPF patients. Study subjects were on stable doses of pirfenidone or nintedanib for at least three months and were randomized 2:1 to receive 30 mg/kg of pamrevlumab or placebo every three weeks for 24 weeks. Thirty-six patients were enrolled in the pirfenidone sub-study and 21 patients were enrolled in the nintedanib sub-study. Pamrevlumab appeared to be well-tolerated when given in combination with either pirfenidone or nintedanib.

Study 049 - Open-Label Phase 2 Trial of Pamrevlumab in IPF

We completed an open-label extension of Study 049, a Phase 2 open-label, dose-escalation study to evaluate the safety, tolerability, and efficacy of pamrevlumab in 89 patients with IPF. During the initial one-year treatment period, pamrevlumab was administered at a dose of 15 mg/kg in Cohort 1 (53 patients) and 30 mg/kg in Cohort 2 (36 patients) by IV infusion every three weeks for 45 weeks. After 45 weeks of dosing, subjects whose FVC declined less than predicted were allowed to continue dosing in an extension study until they had disease progression. Nineteen patients from Cohort 1 (35.8%) and 18 patients from Cohort 2 (50.0%) entered the extension study. Efficacy endpoints were pulmonary function assessments, extent of pulmonary fibrosis as measured by quantitative imaging and measures of health-related quality of life. We presented data from our open-label Phase 2 IPF extension study (049) at the International Colloquium on Lung and Airway Fibrosis in November 2016, reporting that no safety issues were observed during prolonged treatment with pamrevlumab. Some of the 37 patients who enrolled in the extension study were treated with pamrevlumab for up to five years. Trends regarding improved or stable pulmonary function and stable fibrosis observed during the initial one-year study were also observed in the extension study.

In Cohort 1, we enrolled patients with a wide range of disease severity to assess safety and efficacy. Baseline FVC percent predicted for Cohort 1 was 43% to 90%, with a mean of 62.8%. In contrast, other IPF clinical trials, such as those for pirfenidone and nintedanib, have enrolled patients who on average had mild to moderate disease (mean FVC percent predicted 73.1% to 85.5%). Fourteen patients in Cohort 1 withdrew, and ten of the 14 had severe disease.

In order to enroll IPF patients similar to those in other IPF trials, we amended the protocol for Cohort 2 to include only patients with mild to moderate disease (FVC \geq 55% predicted). Baseline FVC percent predicted for Cohort 2 was 53% to 112%, with a mean of 72.7%. Based on this definition of disease severity, 37 patients in Cohort 1 and 32 patients in Cohort 2 had mild to moderate disease.

The table below provides a summary of the observed quantitative change in fibrosis for mild to moderate patients in Cohorts 1 and 2 as measured by quantitative HRCT. Twenty-four percent of these patients had improved fibrosis at Week 48. We believe that this is the first trial to demonstrate a reversal of fibrosis (as measured by HRCT) in a subset of IPF patients. Stable fibrosis has been considered the only achievable favorable outcome in IPF. The table below sets forth the number of patients who showed stable or improved fibrosis at Weeks 24 and 48 compared to the amount of fibrosis at the start of the trial.

Changes in Fibrosis in Patients with Mild to Moderate IPF Treated with Pamrevlumab in FGCL-3019-049

	Stable or Improved Compared to Baseline		Improved Compared to Baseline		Compared to Week 24
	Week 24	Week 48	Week 24	Week 48	Week 48
Cohort 1	21/45 (47%)	14/38 (37%)	12/45 (27%)	12/38 (32%)	8/38 (21%)
Cohort 2	12/29 (41%)	9/28 (32%)	5/29 (17%)	4/28 (14%)	8/26 (31%)
Combined	33/75 (44%)	23/66 (35%)	17/74 (23%)	16/66 (24%)	16/64 (25%)

Eighty-nine patients had at least one adverse event. The most common reported events were cough, fatigue, shortness of breath, upper respiratory tract infection, sore throat, bronchitis, nausea, dizziness, and urinary tract infection. Including the open-label extension, there were 45 serious adverse events in 31 patients, four of which were considered possibly related by the principal investigator to the investigational drug. After investigation, it is our belief that there is no causal relationship between pamrevlumab and the serious adverse events deemed possibly related by the principal investigator. During the first year of treatment there were 38 treatment-emergent serious adverse events in 24 patients. Adverse events observed to date are consistent with typical conditions observed in this patient population.

Pancreatic Cancer

Understanding Pancreatic Cancer and the Limitations of Current Therapies

Certain solid malignant tumors have a prominent fibrosis component consisting mostly of ECM that contributes to metastasis and progressive disease. ECM is the connective tissue framework of an organ or tissue.

Pancreatic ductal adenocarcinoma, or pancreatic cancer, is the third leading cause of cancer deaths in the U.S. According to the European Commission's European Cancer Information System, there were 100,005 new cases of pancreatic cancer and 95,373 deaths from pancreatic cancer in the Europe projected for 2018. The National Cancer Center of Japan estimated that there were 36,239 new cases of pancreatic cancer in 2014, increased from 24,442 cases in 2004. In its report of December 2017, Decision Resources Group estimated that the major market sales (U.S., Europe and Japan) of pancreatic cancer drugs will grow from \$1.3 billion in 2016 to approximately \$3.7 billion in 2026. According to the U.S. National Cancer Institute, there were an estimated 57,000 new cases of pancreatic cancer in the U.S. in 2019. Fifty percent of new cases are metastatic. Another 15-20% have localized resectable tumors. The remaining 30-35% have localized but unresectable tumors.

For those with non-resectable tumors, median survival is eight to 12 months post-diagnosis, and about 8% realize five years of survival; similar to metastatic cases. For those with resectable tumors, 50% survive 17 to 27 months post-diagnosis and ~20% report five-year survival.

Pancreatic cancer is aggressive and typically not diagnosed until it is largely incurable. Most patients are diagnosed after the age of 45, and according to the American Cancer Society, 94% of patients die within five years from diagnosis. The majority of patients are treated with chemotherapy, but pancreatic cancer is highly resistant to chemotherapy. Approximately 15% to 20% of patients are treated with surgery; however, even for those with successful surgical resection, the median survival is approximately two years, with a five year survival rate of 15% to 20% (Neesse et al. Gut (2011)). Radiation treatment may be used for locally advanced diseases, but it is not curative.

The duration of effect of approved anti-cancer agents to treat pancreatic cancer is limited. Gemcitabine demonstrated improvement in median overall survival from approximately four to six months, and erlotinib in combination with gemcitabine demonstrated an additional ten days of survival. Nab-paclitaxel in combination with gemcitabine was approved by the FDA in 2013 for the treatment of pancreatic cancer, having demonstrated median survival of 8.5 months. The combination of folinic acid, 5-fluorouracil, irinotecan and oxaliplatin (FOLFIRINOX) was reported to increase survival to 11.1 months from 6.8 months with gemcitabine. These drugs illustrate that progress in treatment for pancreatic cancer has been modest, and there remains a need for substantial improvement in patient survival and quality of life.

The approved chemotherapeutic treatments for pancreatic cancer target the cancer cells themselves. Tumors are composed of cancer cells and associated non-cancer tissue, or stroma, of which ECM is a major component. In certain cancers such as pancreatic cancer, both the stroma and tumor cells produce CTGF which in turn promotes the proliferation and survival of stromal and tumor cells. CTGF also induces ECM deposition that provides advantageous conditions for tumor cell adherence and proliferation, promotes blood vessel formation, or angiogenesis, and promotes metastasis, or tumor cell migration, to other parts of the body.

Pancreatic cancers are generally resistant to powerful chemotherapeutic agents, and there is now growing interest in the use of an anti-fibrotic agent to diminish the supportive role of stroma in tumor cell growth and metastasis. The anti-tumor effects observed with pamrevlumab in preclinical models indicate that it has the potential to inhibit tumor expansion through effects on tumor cell proliferation and apoptosis as well as reduce metastasis.

Phase 3 Clinical Development - Randomized, Double-Blind, Placebo-Controlled Trial of Pamrevlumab in Locally Advanced, Unresectable Pancreatic Cancer

We continue to enroll LAPIS, our double-blind placebo controlled Phase 3 trial of pamrevlumab as a neoadjuvant therapy for locally advanced unresectable pancreatic cancer. We intend to enroll approximately 260 patients, randomized 1:1 to receive either pamrevlumab, in combination with gemcitabine and nab-paclitaxel, or placebo with gemcitabine and nab-paclitaxel. After completion of the 6-month treatment period, if the results show an improved resection rate in the pamrevlumab arm, we may request a meeting with the FDA to discuss the adequacy of these results to support a marketing application under the provisions of accelerated approval. After this interim assessment of resection rates, the study will continue to collect data on overall survival, the primary endpoint.

Study 069 - Randomized, Open-Label, Active-Controlled Phase 1/2 Trial of Pamrevlumab in Locally Advanced Pancreatic Cancer

We continue to follow patients in our ongoing open-label, randomized (2:1) Phase 1/2 trial (FGC004C-3019-069) of pamrevlumab combined with gemcitabine plus nab-paclitaxel chemotherapy vs. the chemotherapy regimen alone in patients with inoperable locally advanced pancreatic cancer that has not been previously treated. We enrolled 37 patients in this study and completed the six-month treatment period and surgical assessment at the end of 2017. The overall goal of the trial is to determine whether the pamrevlumab combination can convert inoperable pancreatic cancer to operable, or resectable, cancer. Tumor removal is the only chance for cure of pancreatic cancer, but only approximately 15% to 20% of patients are eligible for surgery.

We reported updated results from this ongoing study at the American Society of Clinical Oncology Annual Meeting in June 2018. A higher proportion (70.8%) of pamrevlumab-treated patients whose tumors were previously considered unresectable became eligible for surgical exploration than patients who received chemotherapy alone (15.4%), based on pre-specified eligibility criteria at the end of 6 months of treatment. Furthermore, a higher proportion of pamrevlumab-treated patients (33.3%) achieved surgical resection than those who received chemotherapy alone (7.7%).

In addition, this data showed improved overall survival among patients who were resected vs. not resected (NE vs. 18.56 months, p-value=0.0141) and a trend toward improved overall survival in patients eligible for surgery vs. patients who were not (27.73 vs. 18.40 months, p-value=0.0766). All of the patients on study at the time of the results reported in June 2018 continue to remain on study. No increase in serious adverse events was observed in the pamrevlumab arm and no delay in wound healing was observed post-surgery.

Patients with locally advanced unresectable pancreatic cancer have median survival of less than 12 months, only slightly better than patients with metastatic pancreatic cancer, whereas patients with resectable pancreatic cancer have a much better prognosis with median survival of approximately 23 months and some patients being cured. If pamrevlumab in combination with chemotherapy continues to demonstrate an enhanced rate of conversion from unresectable cancer to resectable cancer, it may support the possibility that pamrevlumab could provide a substantial survival benefit for locally advanced pancreatic cancer patients.

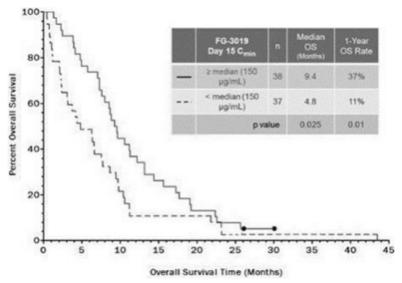

Completed Clinical Trials of Pamrevlumab in Pancreatic Cancer

We completed an open-label Phase 1/2 (FGCL-MC3019-028) dose finding trial of pamrevlumab combined with gemcitabine plus erlotinib in patients with previously untreated locally advanced (Stage 3) or metastatic (Stage 4) pancreatic cancer. These study results were published in the *Journal of Cancer Clinical Trials* (Picozzi et al., J Cancer Clin Trials 2017, 2:123). Treatment continued until progression of the cancer or the patient withdrew for other reasons. Patients were then followed until death.

Seventy-five patients were enrolled in this study with 66 (88%) having Stage 4 metastatic cancer. The study demonstrated a dose-related increase in survival. At the lowest doses, no patients survived for even one year while at the highest doses up to 31% of patients survived one year.

A post-hoc analysis found that there was a significant relationship between survival and trough levels of plasma pamrevlumab measured immediately before the second dose (Cmin), as illustrated below. Cmin greater than or equal to $150~\mu g/mL$ was associated with significantly improved progression-free survival (p=0.01) and overall survival (p=0.03) vs. those patients with Cmin less than $150~\mu g/mL$. For patients with Cmin >150 $\mu g/mL$ median survival was 9.0 months compared to median survival of 4.4 months for patients with Cmin <150 $\mu g/mL$. Similarly, 34.2% of patients with Cmin >150 $\mu g/mL$ survived for longer than one year compared to 10.8% for patients with Cmin <150 $\mu g/mL$. These data suggest that sufficient blockade of CTGF requires pamrevlumab threshold blood levels of approximately $150~\mu g/mL$ in order to improve survival in patients with advanced pancreatic cancer.

Increased Pancreatic Cancer Survival Associated with Increased Plasma Levels of Pamrevlumab

The Kaplan-Meier plot provides a representation of survival of all patients in the clinical trial. Each vertical drop in the curve represents a recorded event (death) of one or more patients. When a patient's event cannot be determined either because he or she has withdrawn from the study or because the analysis is completed before the event has occurred, that patient is "censored" and denoted by a symbol (•) on the curve at the time of the last reliable assessment of that patient.

In the study, the majority of adverse events were mild to moderate, and were consistent with those observed for erlotinib plus gemcitabine treatment without pamrevlumab. There were 99 treatment-emergent serious adverse events; six of which were assessed as possibly related to the investigational drug by the principal investigator, and 93 as not related to study treatment. After investigation, it is our belief that there is no causal relationship between pamrevlumab and the treatment-emergent serious adverse events deemed possibly related by the principal investigator. We did not identify any evolving dose-dependent pattern, and higher doses of pamrevlumab were not associated with higher numbers of serious adverse events or greater severity of the serious adverse events observed.

Pamrevlumab for Duchenne Muscular Dystrophy

Understanding DMD and the Limitations of Current Therapies

In the U.S., approximately one in every 5,000 boys have DMD, and approximately 20,000 children are diagnosed with DMD globally each year. There are currently no approved disease-modifying treatments. Despite taking steroids to mitigate progressive muscle loss, a majority of children with DMD are non-ambulatory by adolescence, and median survival is age 25.

DMD is an inherited disorder of one of the dystrophin genes resulting in absence of the dystrophin protein and abnormal muscle structure and function, leading to progressively diminished mobility as well as pulmonary function and cardiac function which result in early death. Constant myofiber breakdown results in persistent activation of myofibroblasts and altered production of ECM resulting in extensive fibrosis in skeletal muscles of DMD patients. Desguerre et al. (2009) showed that muscle fibrosis was the only myo-pathologic parameter that significantly correlated with poor motor outcome as assessed by quadriceps muscle strength, manual muscle testing of upper and lower limbs, and age at ambulation loss. Numerous pre-clinical studies including those in the mdx model of DMD suggest that CTGF contributes to the process by which muscle is replaced by fibrosis and fat and that CTGF may also impair muscle cell differentiation during muscle repair after injury.

Clinical Development of Pamrevlumab for Duchenne Muscular Dystrophy

Based on the FDA review of one year data from our Phase 2 administrative analysis, we intend to begin a Phase 3 study of pamrevlumab in non-ambulatory DMD patients in the second half of 2020.

All 21 non-ambulatory patients from our fully enrolled Phase 2 open-label single-arm trial have completed over one year of treatment with pamrevlumab. While we cannot make direct comparisons between our trial and previously published data due to, among other things, differences in subject numbers, baseline characteristics, inclusion/exclusion criteria, treatment protocols, and analysis methods, we are encouraged by the data obtained so far. Pamrevlumab was well tolerated in this study.

In June 2019 at the Parent Project Muscular Dystrophy meeting, we reported topline results from our one-year administrative analysis comparing our Phase 2 data to recent published natural disease history studies of DMD patients.

In pulmonary function tests, the results from our study indicate a potential reduction in the 1-year decline in FVC percent predicted from baseline for our pamrevlumab-treated patients when compared to FVC data of DMD patients (whether such patients were taking steroids or not) published in 2019 by Ricotti. In the 2019 Ricotti study, the DMD patients were treated with steroids only. Similarly, all of the patients in our Phase 2 pamrevlumab trial were on steroids. In addition, pamrevlumab showed less decline in both percent predicted forced expiratory volume as compared to previously published study results of Meier in 2016, and in percent predicted peak expiratory flow rate, compared to what was observed in the study by Ricotti in 2019.

Our data showed an increase in cardiac function, measured by mean change of left ventricular ejection fraction ("LVEF"), of 0.29% from baseline for our pamrevlumab-treated patients. Whereas, data published in 2018 by McDonald of DMD patients only on steroids showed a mean LVEF decline of 0.82% from baseline in one year.

In muscle function tests, the majority of the results of this Phase 2 study showed the mean change from baseline in our pamrevlumab-treated patients were more favorable than previously published data. Our results showed a positive increase in grip-strength score in both dominant and non-dominant hands at one year of treatment with pamrevlumab, while earlier results from a 2015 study by Seferian showed a decline at one year as expected. In the performance of the upper limb ("PUL") test specifically developed for DMD patients, our pamrevlumab-treated patients had a mean change from baseline of -1.53. In the 2019 study by Ricotti of DMD patients taking either nothing or only steroids, the annual mean change in the PUL test was -4.13. Furthermore, in our study a strong correlation between change in biceps brachii T2-mapping and change in PUL score was observed, demonstrating stabilization and even possible improvement in the muscle fibrosis burden.

Commercialization Strategy for Pamrevlumab

Our goal, if pamrevlumab is successful, is to be a leader in the development and commercialization of novel approaches for inhibiting fibrosis and treating some forms of cancer and muscular dystrophy diseases. To date, we have retained exclusive worldwide rights for pamrevlumab.

COLLABORATIONS

Collaboration Partnerships for Roxadustat

Astellas

We have two agreements with Astellas for the development and commercialization of roxadustat, one for Japan, and one for Europe, the Commonwealth of Independent States, the Middle East and South Africa. Under these agreements we provided Astellas the right to develop and commercialize roxadustat for anemia in these territories.

We share responsibility with Astellas for clinical development activities required for U.S. and Europe regulatory approval of roxadustat, and share equally those development costs under the agreed development plan for such activities. Astellas will be responsible for clinical development activities and all associated costs required for regulatory approval in all other countries in the Astellas territories. Astellas will own and have responsibility for regulatory filings in its territories. We are responsible, either directly or through our contract manufacturers, for the manufacture and supply of all quantities of roxadustat to be used in development and commercialization under the agreements.

The Astellas agreements will continue in effect until terminated. Either party may terminate the agreements for certain material breaches by the other party. In addition, Astellas will have the right to terminate the agreements for certain specified technical product failures, upon generic sales reaching a particular threshold, upon certain regulatory actions, or upon our entering into a settlement admitting the invalidity or unenforceability of our licensed patents. Astellas may also terminate the agreements for convenience upon advance written notice to us. In the event of any termination of the agreements, Astellas will transfer and assign to us the regulatory filings for roxadustat and will assign or license us the relevant trademarks used with the products in the Astellas territories. Under certain terminations, Astellas is also obligated to pay us a termination fee.

Consideration under these agreements includes a total of \$360.1 million in upfront and non-contingent payments, and milestone payments totaling \$557.5 million, of which \$542.5 million are development and regulatory milestones, and \$15.0 million are commercial-based milestones. Total consideration, excluding development cost reimbursement and product sales-related payments, could reach \$917.6 million.

Additionally, under these agreements, Astellas pays 100% of the commercialization costs in their territories. Astellas will pay us a transfer price for our manufacture and delivery of roxadustat based on net sales of roxadustat in the low 20% range.

AstraZeneca

We also have two agreements with AstraZeneca for the development and commercialization of roxadustat for anemia, one for China (the "China Agreement"), and one for the U.S. and all other countries not previously licensed to Astellas (the "U.S./RoW Agreement"). Under these agreements we provided AstraZeneca the right to develop and commercialize roxadustat for anemia in these territories. We share responsibility with AstraZeneca for clinical development activities required for U.S. regulatory approval of roxadustat.

In 2015, we reached the \$116.5 million cap on our initial funding obligations (under which we shared 50% of the initial development costs), therefore all future development and commercialization costs for roxadustat for the treatment of anemia in CKD in the U.S., Europe, Japan and all other markets outside of China will be paid by Astellas and AstraZeneca.

In China, our subsidiary FibroGen Beijing will conduct the development work for CKD anemia and will hold all of the regulatory licenses issued by China regulatory authorities and be primarily responsible for regulatory, clinical and manufacturing. China development costs are shared 50/50. AstraZeneca is also responsible for 100% of development expenses in all other licensed territories outside of China. We are responsible, through our contract manufacturers, for the manufacture and supply of all quantities of roxadustat to be used in development and commercialization under the agreements.

Under the AstraZeneca agreements, we receive upfront and subsequent non-contingent payments totaling \$402.2 million. Potential milestone payments under the agreements total \$1.2 billion, of which \$571.0 million are development and regulatory milestones, and \$652.5 million are commercial-based milestones. Total consideration under the agreements, excluding development cost reimbursement, transfer price payments, royalties and profit share, could reach \$1.6 billion.

Payments under these agreements include over \$500 million in upfront, non-contingent and other payments received or expected to be received prior to the first U.S. approval, excluding development expense reimbursement.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 271 of 1730

Under the U.S./RoW Agreement, AstraZeneca will pay for all commercialization costs in the U.S. and RoW, AstraZeneca will be responsible for the U.S. commercialization of roxadustat, with FibroGen undertaking specified promotional activities in the ESRD segment in the U.S. In addition, we will receive a transfer price for delivery of commercial product based on a percentage of net sales in the low- to mid-single digit range and AstraZeneca will pay us a tiered royalty on net sales of roxadustat in the low 20% range.

Under the China Agreement, which is conducted through FibroGen China Anemia Holdings, Ltd. ("FibroGen China"), the commercial collaboration is structured as a 50/50 profit share. AstraZeneca will conduct sales and marketing activities in China for roxadustat and will fund roxadustat launch costs in China until FibroGen Beijing has achieved profitability. At that time, AstraZeneca will recoup 50% of their historical launch costs out of initial roxadustat profits in China.

AstraZeneca may terminate the U.S./RoW Agreement upon specified events, including our bankruptcy or insolvency, our uncured material breach, technical product failure, or upon 180 days prior written notice at will. If AstraZeneca terminates the U.S/RoW Agreement at will, in addition to any unpaid non-contingent payments, it will be responsible to pay for a substantial portion of the post-termination development costs under the agreed development plan until regulatory approval.

AstraZeneca may terminate the China Agreement upon specified events, including our bankruptcy or insolvency, our uncured material breach, technical product failure, or upon advance prior written notice at will. If AstraZeneca terminates our China Agreement at will, it will be responsible to pay for transition costs as well as make a specified payment to FibroGen China.

In the event of any termination of the agreements, but subject to modification upon termination for technical product failure, AstraZeneca will transfer and assign to us any regulatory filings and approvals for roxadustat in the affected territories that they may hold under our agreements, grant us licenses and conduct certain transition activities.

Additional Information Related to Collaboration Agreements

Additional information related to collaboration agreements is set forth in Item 7 of this Annual Report on Form 10-K. Information about collaboration partners that accounted for more than 10% of our total revenue or accounts receivable for the last three fiscal years is set forth in Note 14 to our consolidated financial statements under Item 8 of this Annual Report.

COMPETITION

The pharmaceutical and biotechnology industries are highly competitive, particularly in some of the indications we are developing drug candidates, including anemia in CKD, IPF, pancreatic cancer, and DMD. We face competition from multiple other pharmaceutical and biotechnology companies, many of which have significantly greater financial, technical and human resources and experience in product development, manufacturing and marketing. These potential advantages of our competitors are particularly a risk in IPF, pancreatic cancer, and DMD, where we do not currently have a development or commercialization partner.

We expect any products that we develop and commercialize to compete on the basis of, among other things, efficacy, safety, convenience of administration and delivery, price, the level of generic competition, and the availability of reimbursement from government and other third-party payors.

When any of our product candidates are approved, they will compete with currently marketed products, and product candidates that may be approved for marketing in the future, for treatment of the following indications:

Roxadustat - Anemia in CKD

Drugs that will compete with roxadustat are expected to include ESAs, particularly in those patient segments where ESAs are used. Currently available ESAs include epoetin alfa (EPOGEN® marketed by Amgen Inc. in the U.S., Procrit® and Erypo®/Eprex®, marketed by Johnson & Johnson, Inc. and Espo® marketed by Kyowa Hakko Kirin in Japan and China), darbepoetin (Amgen/Kyowa Hakko Kirin's Aranesp® and NESP®) and Mircera® marketed by Roche outside the U.S. and by Vifor Pharma ("Vifor"), a Roche licensee, in the U.S. and Puerto Rico, as well as biosimilar versions of these currently marketed ESA products. ESAs have been used in the treatment of anemia in CKD for more than 20 years, serving a significant majority of dialysis patients. While non-dialysis CKD patients who are not under the care of nephrologists, including those with diabetes and hypertension, do not typically receive ESAs and are often left untreated, some patients under nephrology care may be receiving ESA therapy. It may be difficult to encourage healthcare providers and patients to switch to roxadustat from products with which they have become familiar.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 272 of 1730

We may also face competition from potential new anemia therapies currently in clinical development, including in those patient segments not currently addressed by ESAs. Companies that are currently developing HIF-PH inhibitors for anemia in CKD indications include GlaxoSmithKline plc ("GSK"), Bayer Corporation ("Bayer"), Akebia Therapeutics, Inc. ("Akebia"), Japan Tobacco, and Zydus Cadila. Akebia is currently conducting Phase 3 studies in CKD patients on dialysis and not on dialysis, as well as a Phase 2 study evaluating pharmacokinetics and pharmacodynamics in dialysis-dependent patients with three-times weekly versus once-a-day dosing. Akebia expects to complete these studies by August 2020. In Japan, Mitsubishi Tanabe Pharmaceutical Corporation, Akebia's collaboration partner, submitted an NDA for treatment of anemia in dialysis and non-dialysis CKD patients in July 2019, and is awaiting an approval decision later in 2020. GSK is also conducting global Phase 3 studies in CKD patients on dialysis and not on dialysis, and expects to complete those studies by March 2022. GSK and Kyowa Hakko Kirin announced in November 2018 that the two companies signed a strategic commercialization deal in Japan for daprodustat. GSK submitted a Japan NDA for treatment of anemia in dialysis and non-dialysis in August 2019 and is awaiting approval later in 2020. Bayer has completed global Phase 2 studies and its HIF-PH inhibitor is now in Phase 3 development in CKD populations on dialysis and not on dialysis in Japan. Japan Tobacco submitted an NDA for treatment of anemia associated with CKD in Japan in November 2019, supported by the six Phase 3 studies conducted in CKD patients on dialysis and not on dialysis in Japan, and its partner JW Pharmaceuticals started a Phase 3 study in dialysis patients in Korea. Zydus Cadila (India) started Phase 3 studies in dialysis and non-dialysis CKD patients in India in 2019.

In addition, there are other companies developing biologic therapies for the treatment of other anemia indications that we may also seek to pursue in the future, including anemia of MDS. For example, Acceleron Pharma, Inc., in partnership with Celgene Corporation, a Bristol-Myers Squibb company ("Celgene"), developed Reblozyl® (luspatercept), a protein therapeutic, which was approved in November 2019 by the FDA for anemia treatment in patients with β-thalassemia. Its Biologics License Application ("BLA") under review by the FDA, for treatment of adult patients with very low to intermediate MDS associated anemia who have ring sideroblast and require red blood cell transfusions, has a Prescription Drug User Fee Act date of April 4, 2020. Acceleron expects an EMA decision on the MAA in the second half of 2020. In Japan, Celgene started a luspatercept Phase 2 study in May 2019. We may face competition for patient recruitment, enrollment for clinical trials, and potentially in commercial sales. There may also be new therapies for renal-related diseases that could limit the market or level of reimbursement available for roxadustat if and when it is commercialized.

In China, biosimilars of epoetin alfa are offered by Chinese pharmaceutical companies such as EPIAO marketed by 3SBio Inc. as well as more than 15 other local manufacturers. We may also face competition by HIF-PH inhibitors from other companies such as Akebia, Bayer, and GSK, which was authorized by the National Medical Products Administration ("NMPA") to conduct trials in China to support its ex-China regulatory filings. Two domestic companies, Jiangsu Hengrui Medicine Co., Ltd. and Guandong Sunshine Health Investment Co., Ltd, have been permitted by the NMPA to conduct clinical trials for CKD anemia patients both on dialysis and not on dialysis, and 3SBio Inc. has submitted a clinical trial application to the NMPA to initiate trials for their HIF-PH inhibitor. Another domestic company, China Medical System, in-licensed desidustat, a compound which is currently in Phase 3 trials in India, from Zydus Candila for greater China in January 2020. Akebia announced in December 2015 that it had entered into a development and commercialization partnership with Mitsubishi Tanabe Pharmaceutical Corporation for its HIF-PH inhibitor vadadustat in Japan, Taiwan, South Korea, India and certain other countries in Asia, and announced in April 2017 an expansion of their U.S. collaboration with Otsuka to add markets, including China. 3SBio Inc. announced in 2016 its plan to begin a Phase 1 clinical trial of a HIF-PH inhibitor for the China market.

The first biosimilar ESA, Pfizer's Retacrit® (epoetin zeta), entered the U.S. market in November 2018. Market penetration of Retacrit and the potential addition of other biosimilar ESAs currently under development may alter the competitive and pricing landscape of anemia therapy in CKD patients on dialysis under the ESRD bundle. The patents for Amgen's EPOGEN® (epoetin alfa) expired in 2004 in the Europe, and the final material patents in the U.S. expired in May 2015. Several biosimilar versions of currently marketed ESAs are available for sale in the Europe, China and other territories. In the U.S., a few ESA biosimilars are currently under development. Sandoz, a division of Novartis, markets Binocrit® (epoetin alfa) in Europe and may file a biosimilar BLA in the U.S.

The majority of the current CKD anemia market focuses on dialysis patients, who visit dialysis centers on a regular basis, typically three times a week, and anemia therapies are administered as part of the visit. Two of the largest operators of dialysis clinics in the U.S., DaVita Healthcare Partners Inc. ("DaVita"), and Fresenius Medical Care AG & Co. KGaA ("Fresenius"), collectively provide dialysis care to more than 80% of U.S. dialysis patients, and therefore have historically won long-term contracts including rebate terms with Amgen. DaVita has a six-year sourcing and supply agreement with Amgen effective through 2022. Fresenius' contract with Amgen expired in 2015, following which Fresenius is providing Roche's ESA Mircera® to a significant portion of its U.S. dialysis patients. Successful penetration in this market may require a significant agreement with Fresenius or DaVita, on favorable terms and on a timely basis.

Pamrevlumab

We are currently in Phase 2 development of pamrevlumab to treat DMD and Phase 3 development of pamrevlumab in IPF and pancreatic cancer. Most of our competitors have significantly more resources and expertise in development, commercialization and manufacturing, particularly due to the fact that we have not yet established a co-development partnership for pamrevlumab. For example, both Roche and Boehringer Ingelheim, which market products for the treatment of IPF in the U.S., have successfully developed and commercialized drugs in various indications and have built sales organizations that we do not currently have; both have more resources and more established relationships when competing with us for patient recruitment and enrollment for clinical trials or, if we are approved, in the market.

Idiopathic Pulmonary Fibrosis

If approved and launched commercially to treat IPF, pamrevlumab is expected to compete with Roche's Esbriet® (pirfenidone), and Boehringer Ingelheim's Ofev® (nintedanib). We believe that if pamrevlumab can be shown to safely stabilize or reverse lung fibrosis, and thus stabilize or improve lung function in IPF patients, it can compete with pirfenidone and nintedanib for market share in IPF. However, it may be difficult to encourage treatment providers and patients to switch to pamrevlumab from a product they are already familiar with. We may also face competition from potential new IPF therapies in recruitment and enrollment in our clinical trials and potentially in commercialization.

Pamrevlumab is an injectable protein, which may be more expensive and less convenient than small molecules such as nintedanib and pirfenidone. Other potential competitive product candidates in various stages of development for IPF include Galapagos NV's GLPG1690 and GLPG1205, Kadmon Holdings, Inc.'s KD025, Liminal BioSciences' PBI-4050, and Roche/Promedior, Inc.'s PRM-151. In particular, GLPG1690 is in a Phase 3 program consisting of two clinical trials with 750 subjects each, intended to support both the U.S. NDA and MAA in Europe.

Pancreatic Cancer

We are developing pamrevlumab to be used in combination with Abraxane® (nab-paclitaxel) and gemcitabine in pancreatic cancer. Celgene's Abraxane was launched in the U.S. and Europe in 2013 and 2014, respectively, and was the first drug approved in this disease in nearly a decade. In 2015, Merrimack Pharmaceuticals Inc. ("Merrimack") received FDA approval for the use of ONIVYDE (irinotecan liposome injection, now licensed to Ipsen) for the treatment of patients with metastatic adenocarcinoma of the pancreas after disease progression following gemcitabine-based therapy, and the combination therapy with Abraxane and gemcitabine became the first-line standard of care in these patients. As treatments for pancreatic cancer have shown limited success to date, combination therapies are expected, but the incremental cost may slow a new product adoption in the market, at least until the generic versions of Abraxane becomes available. In addition, we may also face competition from other products seeking approval in conjunction with gemcitabine and Abraxane including FOLFRINOX, a combination chemotherapy regimen of folic acid, 5-fluouracil, oxaliplatin and irinotecan, Rafael Pharma's defactinib/CPI-613, and Merrimack's istiratumab.

Duchenne Muscular Dystrophy

If approved and launched commercially to treat DMD, pamrevlumab is expected to face competition from drugs that have been approved in major markets such as the U.S., EU, and Japan.

On September 19, 2016, the FDA approved Sarepta Therapeutics Inc.'s ("Sarepta") Exondys 51TM (eteplirsen). This was the first drug approved to treat DMD. Exondys 51 is approved to treat patients who have a mutation of the dystrophin gene amenable to exon 51 skipping, representing approximately 13% of patients with DMD. In Europe, Sarepta received a negative opinion for its marketing application for eteplirsen from the EMA in September 2018. Sarepta has reported a full year Exondys 51 revenue of \$380 million in 2019. Sarepta's Vyondys 53TM (golodirsen) was also approved by the FDA in December 2019 for patients with a confirmed genetic mutation that is amenable to exon 53 skipping, which accounts for 8% of the DMD population.

PTC Therapeutics' product Translarna TM received a conditional approval in Europe in 2014, which was renewed in November 2016 with a request for a new randomized placebo-controlled 18-month study by the Committee for Medicinal Products for Human Use of the EMA; however, the FDA informed the sponsor in a complete response letter in October 2017, as well as in its response to PTC Therapeutics' appeal, that the FDA is unable to approve the application in its current form. While Translarna TM targets a different set of DMD patients from those targeted by Sarepta's Exondys 51®, it is also limited to a subset of patients who carry a specific mutation. Conversely, pamrevlumab is intended to treat DMD patients without limitation to type of mutation.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 274 of 1730

Pamrevlumab may also face competition from other drugs currently in clinical development in patient recruiting and enrollment in clinical trials, and, if approved, in commercialization. Examples of those compounds currently under clinical development are the drug candidates from Catabasis Pharmaceuticals ("Catabasis"), Santhera Pharmaceuticals ("Santhera") and Sarepta. Catabasis' edasalonexent was reported to have preserved muscle function and slowed the progression of DMD compared to rates of change in the control period prior to treatment with edasalonexent in a Phase 2 study, and is currently undergoing Phase 3 development. Santhera's Puldysa® (idebenone) MAA for treatment of DMD was filed with the EMA, and the opinion from the Committee for Medicinal Products for Human Use is expected in the second quarter of 2020. The FDA requested additional clinical data from the idebenone Phase 3 trial currently ongoing in the U.S. and Europe. Santhera offers compassionate use of idebenone in patients with DMD in U.S. and UK. Sarepta's SRP-9001 is an investigational gene therapy for DMD. Sarepta announced in December 2019 the licensing agreement with Roche that grants Roche the commercial rights to SRP-9001 outside the U.S.

MANUFACTURE AND SUPPLY

We have historically and in the future plan to continue to enter into contractual arrangements with qualified third-party manufacturers to manufacture and package our products and product candidates. We believe that this manufacturing strategy enables us to more efficiently direct financial resources to the research, development and commercialization of product candidates rather than diverting resources to establishing a significant internal manufacturing infrastructure, unless there is additional strategic value for establishing manufacturing capabilities, such as in China. As our product candidates proceed through development, we explore or enter into longer term commercial supply agreements with key suppliers and manufacturers in order to meet the ongoing and planned clinical and commercial supply needs for ourselves and our partners. Our timing of entry into these agreements is based on the current development and commercialization plans.

Roxadustat

Roxadustat is a small-molecule drug manufactured from generally available commercial starting materials and chemical technologies and multipurpose equipment available from many third party contract manufacturers. Outside of China, we plan to continue to use, Shanghai SynTheAll
Pharmaceutical Co., Ltd. ("WuXi STA") and Catalent, Inc. ("Catalent") as our primary manufacturers of roxadustat drug substance (also known as
active pharmaceutical ingredient or "API") and roxadustat drug product, respectively. WuXi STA is located in China and currently supplies our API
globally except for China, for which it manufactures an intermediate to be further manufactured by FibroGen China. WuXi STA has passed
inspections by several regulatory agencies, including the FDA and NMPA, and is Current Good Manufacturing Practice ("cGMP") compliant.
Catalent is located in the U.S. and supplies our drug product tablets globally except for Japan, where they are manufactured by Astellas, and China,
where they are manufactured by FibroGen China. Catalent has passed several regulatory inspections, including by the FDA, and manufactures
commercial products for other clients.

To date, we believe that roxadustat has been manufactured under cGMP and in compliance with applicable regulatory requirements for the manufacture of drug substance and drug product used in clinical trials and we and Astellas have performed audits of the existing roxadustat manufacturers. The intended commercial manufacturing route outside of China has been successfully scaled up to multiple hundred kilogram scale and produced several metric tons of roxadustat drug substance. We are in discussions with multiple parties regarding longer term commercial supply arrangements.

In China, our Beijing facility received the Good Manufacturing Practice ("GMP") license for API and drug product. We are manufacturing drug product at our FibroGen Beijing manufacturing facility for commercial supply. We are manufacturing API at our Cangzhou manufacturing facility, which has been fully qualified and licensed. We may also qualify a third party manufacturer to produce commercial API under the Marketing Authorization Holder System program.

Irix Pharmaceuticals, Inc.

In July 2002, we and IRIX Pharmaceuticals, Inc. ("IRIX"), a third party manufacturer, entered into a Letter of Agreement for IRIX Pharmaceuticals Single Source Manufacturing Agreement (the "Letter of Agreement"), in connection with a contract manufacturing arrangement for clinical supplies of HIF-PH inhibitors, including roxadustat. The Letter of Agreement contained a service agreement that included terms and schedule for the delivery of clinical materials, and also included a term sheet for a single source agreement for the cGMP manufacture of HIF-PH inhibitors, including roxadustat. Specifically, pursuant to the Letter of Agreement, we and IRIX agreed to negotiate a single source manufacturing agreement that included a first right to negotiate a manufacturing contract for HIF-PH inhibitors, including roxadustat, provided that IRIX is able to match any third party bids within 5%, and the exclusive right to manufacture extends for five years after approval of an NDA. Any agreement would provide that no minimum amounts would be specified until appropriate by forecast, that we and our commercialization partner would have the rights to contract with independent third parties that exceed IRIX's internal capabilities or in the event that we or our commercialization partner determines for reasons of continuity and security that such a need exists, provided that IRIX would supply a majority of the product if it is able to meet the requirements and the schedule required by us and our partner. Subsequent to the Letter of Agreement, we and IRIX have entered into several additional service agreements. IRIX has requested in writing that we honor the Letter of Agreement with respect to the single source manufacturing agreement. To date, we have offered to IRIX opportunities to bid for the manufacture of HIF-PH inhibitors, including roxadustat. In 2015, Patheon Pharmaceuticals Inc., a business unit of DPx Holdings B.V. ("Patheon"), acquired IRIX, and in 2017 ThermoFisher Scientific Inc. acquired Patheon.

Pamreylumab

To date, pamrevlumab has been manufactured using specialized biopharmaceutical process techniques under an agreement with a qualified third party contract manufacturer, Boehringer Ingelheim. Our contract manufacturer is the sole source for the current clinical supply of the drug substance and drug product for pamrevlumab. Our contract manufacturer is only obligated to supply the amounts of pamrevlumab as agreed on pursuant to work orders that are executed from time to time under our agreement as we determine need for clinical material, and we are not required to make fixed or minimum annual purchases. Our existing agreement allows us to transfer the cell line manufacturing process to another third party manufacturer at our expense, and our contractor is obligated to provide reasonable technology transfer assistance in the event of such a transfer.

GOVERNMENT REGULATION

The clinical testing, manufacturing, labeling, storage, distribution, record keeping, advertising, promotion, import, export and marketing, among other things, of our product candidates are subject to extensive regulation by governmental authorities in the U.S. and other countries. The process of obtaining regulatory approvals and the subsequent compliance with appropriate federal, state, local and foreign statutes and regulations, including in Europe and China, requires the expenditure of substantial time and financial resources. Failure to comply with the applicable requirements at any time during the product development process, approval process or after approval may subject an applicant and/or sponsor to a variety of administrative or judicial sanctions, including refusal by the applicable regulatory authority to approve pending applications, withdrawal of an approval, imposition of a clinical hold, issuance of warning letters and other types of letters, product recalls, product seizures, total or partial suspension of production or distribution, injunctions, fines, refusals of government contracts, restitution, disgorgement of profits, or civil or criminal investigations and penalties brought by FDA and the Department of Justice, or other governmental entities.

U.S. Product Approval Process

In the U.S., the FDA regulates drugs and biological products, or biologics, under the Public Health Service Act, as well as the FDCA which is the primary law for regulation of drug products. Both drugs and biologics are subject to the regulations and guidance implementing these laws. Pharmaceutical products are also subject to regulation by other governmental agencies, such as the Federal Trade Commission, the Office of Inspector General of the U.S. Department of Health and Human Services, the Consumer Product Safety Commission and the Environmental Protection Agency. The clinical testing, manufacturing, labeling, storage, distribution, record keeping, advertising, promotion, import, export and marketing, among other things, of our product candidates are subject to extensive regulation by governmental authorities in the U.S. and other countries. The steps required before a drug or biologic may be approved for marketing in the U.S. generally include:

- Preclinical laboratory tests and animal tests conducted under Good Laboratory Practices.
- The submission to the FDA of an IND for human clinical testing, which must become effective before each human clinical trial commence.
- Adequate and well-controlled human clinical trials to establish the safety and efficacy of the product and conducted in accordance with Good Clinical Practices.

- The submission to the FDA of an NDA, in the case of a small molecule drug product, or a BLA, in the case of a biologic product.
- FDA acceptance, review and approval of the NDA or BLA, as applicable.
- Satisfactory completion of an FDA inspection of the manufacturing facilities at which the product is made to assess compliance with

The testing and approval process requires substantial time, effort and financial resources, and the receipt and timing of any approval is uncertain. The FDA may suspend clinical trials at any time on various grounds, including a finding that the subjects or patients are being exposed to a potentially unacceptable health risk.

Preclinical studies include laboratory evaluations of the product candidate, as well as animal studies to assess the potential safety and efficacy of the product candidate. Preclinical studies must be conducted in compliance with FDA regulations regarding GLPs. The results of the preclinical studies, together with manufacturing information and analytical data, are submitted to the FDA as part of the IND, which includes the results of preclinical testing and a protocol detailing, among other things, the objectives of the clinical trial, the parameters to be used in monitoring safety and the effectiveness criteria to be evaluated if the first phase or phases of the clinical trial lends themselves to an efficacy determination. The IND will become effective automatically 30 days after receipt by the FDA, unless the FDA raises concerns or questions about the conduct of the trials as outlined in the IND prior to that time. In this case, the IND sponsor and the FDA must resolve any outstanding concerns before clinical trials can proceed. The IND must become effective before clinical trials may be commenced.

Clinical trials involve the administration of the product candidates to healthy volunteers, or subjects, or patients with the disease to be treated under the supervision of a qualified principal investigator. Clinical trials must be conducted under the supervision of one or more qualified principal investigators in accordance with GCPs and in accordance with protocols detailing the objectives of the applicable phase of the trial, dosing procedures, research subject selection and exclusion criteria and the safety and effectiveness criteria to be evaluated. Progress reports detailing the status of clinical trials must be submitted to the FDA annually. Sponsors must also timely report to the FDA serious and unexpected adverse events, any clinically important increase in the rate of a serious suspected adverse event over that listed in the protocol or investigator's brochure, or any findings from other studies or tests that suggest a significant risk in humans exposed to the product candidate. Further, the protocol for each clinical trial must be reviewed and approved by an independent institutional review board ("IRB"), either centrally or individually at each institution at which the clinical trial will be conducted. The IRB will consider, among other things, ethical factors, and the safety of human subjects and the possible liability of the institution.

Clinical trials are typically conducted in three sequential phases prior to approval, but the phases may overlap and different trials may be initiated with the same drug candidate within the same phase of development in similar or different patient populations. These phases generally include the following:

Phase 1. Phase 1 clinical trials represent the initial introduction of a product candidate into human subjects, frequently healthy volunteers. In Phase 1, the product candidate is usually tested for pharmacodynamic and pharmacokinetic properties such as safety, including adverse effects, dosage tolerance, absorption, distribution, metabolism and excretion.

Phase 2. Phase 2 clinical trials usually involve studies in a limited patient population to (1) evaluate the efficacy of the product candidate for specific indications, (2) determine dosage tolerance and optimal dosage and (3) identify possible adverse effects and safety risks.

Phase 3. If a product candidate is found to be potentially effective and to have an acceptable safety profile in Phase 2 studies, the clinical trial program will be expanded to Phase 3 clinical trials to further evaluate clinical efficacy, optimal dosage and safety within an expanded patient population at geographically dispersed clinical study sites.

Phase 4. Phase 4 clinical trials are conducted after approval to gain additional experience from the treatment of patients in the intended therapeutic indication and to document a clinical benefit in the case of drugs approved under accelerated approval regulations, or when otherwise requested by the FDA in the form of post-market requirements or commitments. Failure to promptly conduct any required Phase 4 clinical trials could result in withdrawal of approval.

The results of preclinical studies and clinical trials, together with detailed information on the manufacture, composition and quality of the product candidate, are submitted to the FDA in the form of an NDA (for a drug) or BLA (for a biologic), requesting approval to market the product. The application must be accompanied by a significant user fee payment. The FDA has substantial discretion in the approval process and may refuse to accept any application or decide that the data is insufficient for approval and require additional preclinical, clinical or other studies.

Review of Application

Once the NDA or BLA submission has been accepted for filing, which occurs, if at all, 60 days after submission, the FDA informs the applicant of the specific date by which the FDA intends to complete its review. This is typically 12 months from the date of submission. The review process is often extended by FDA requests for additional information or clarification. The FDA reviews NDAs and BLAs to determine, among other things, whether the proposed product is safe and effective for its intended use, and whether the product is being manufactured in accordance with cGMP to assure and preserve the product's identity, strength, quality and purity. Before approving an NDA or BLA, the FDA may inspect the facilities at which the product is manufactured and will not approve the product unless the manufacturing facility complies with cGMPs and will also inspect clinical trial sites for integrity of data supporting safety and efficacy. During the approval process, the FDA also will determine whether a REMS, is necessary to assure the safe use of the product. If the FDA concludes a REMS is needed, the sponsor of the application must submit a proposed REMS; the FDA will not approve the application without an approved REMS, if required. A REMS can substantially increase the costs of obtaining approval. The FDA may also convene an advisory committee of external experts to provide input on certain review issues relating to risk, benefit and interpretation of clinical trial data. The FDA may delay approval of an NDA if applicable regulatory criteria are not satisfied and/or the FDA requires additional testing or information. The FDA may require post-marketing testing and surveillance to monitor safety or efficacy of a product. FDA will issue either an approval of the NDA or BLA or a complete response letter detailing the deficiencies and information required in order for reconsideration of the application.

Pediatric Exclusivity and Pediatric Use

Under the Best Pharmaceuticals for Children Act, certain drugs or biologics may obtain an additional six months of exclusivity in an indication, if the sponsor submits information requested in writing by the FDA ("Written Request"), relating to the use of the active moiety of the drug or biologic in children. The FDA may not issue a Written Request for studies on unapproved or approved indications or where it determines that information relating to the use of a drug or biologic in a pediatric population, or part of the pediatric population, may not produce health benefits in that population.

We have not received a Written Request for such pediatric studies with respect to our product candidates, although we may ask the FDA to issue a Written Request for studies in the future. To receive the six-month pediatric market exclusivity, we would have to receive a Written Request from the FDA, conduct the requested studies in accordance with a written agreement with the FDA or, if there is no written agreement, in accordance with commonly accepted scientific principles, and submit reports of the studies. A Written Request may include studies for indications that are not currently in the labeling if the FDA determines that such information will benefit the public health. The FDA will accept the reports upon its determination that the studies were conducted in accordance with and are responsive to the original Written Request, agreement, or commonly accepted scientific principles, as appropriate, and that the reports comply with the FDA's filing requirements.

In addition, the Pediatric Research Equity Act ("PREA") requires a sponsor to conduct pediatric studies for most drugs and biologicals, for a new active ingredient, new indication, new dosage form, new dosing regimen or new route of administration. Under PREA, original NDAs, BLAs and supplements thereto must contain a pediatric assessment unless the sponsor has received a deferral or waiver. The required assessment must include the evaluation of the safety and effectiveness of the product for the claimed indications in all relevant pediatric subpopulations and support dosing and administration for each pediatric subpopulation for which the product is safe and effective. The FDA, on its own initiative or at the request of the sponsor, may request a deferral of pediatric studies for some or all of the pediatric subpopulations. A deferral may be granted by FDA if they believe that additional safety or effectiveness data in the adult population needs to be collected before the pediatric studies begin. After April 2013, the FDA must send a non-compliance letter to any sponsor that fails to submit the required assessment, keep a deferral current or fails to submit a request for approval of a pediatric formulation.

Post-Approval Requirements

Even after approval, drugs and biologics manufactured or distributed pursuant to FDA approvals are subject to continuous regulation by the FDA, including, among other things, requirements relating to recordkeeping, periodic reporting, product distribution, advertising and promotion and reporting of adverse experiences with the product. After approval, most changes to the approved product, such as adding new indications or other labeling claims are subject to prior FDA review and approval. There also are continuing, annual user fee requirements for any marketed products and the establishments at which such products are manufactured, as well as new application fees for supplemental applications with clinical data.

The FDA may impose a number of post-approval requirements as a condition of approval of an NDA or BLA. For example, the FDA may require post-marketing testing, including Phase 4 clinical trials, and surveillance to further assess and monitor the product's safety and effectiveness after commercialization.

In addition, entities involved in the manufacture and distribution of approved drugs and biologics are required to register their establishments with the FDA and state agencies, and are subject to periodic unannounced inspections by the FDA and these state agencies for compliance with cGMP requirements. Changes to the manufacturing process are strictly regulated and often require prior FDA approval before being implemented. FDA regulations also require investigation and correction of any deviations from cGMP and impose reporting and documentation requirements upon the sponsor and any third-party manufacturers that the sponsor may decide to use. Accordingly, manufacturers must continue to expend time, money, and effort in the area of production and quality control to maintain cGMP compliance.

Once an approval is granted, the FDA may withdraw the approval if compliance with regulatory requirements and standards is not maintained or if problems occur after the product reaches the market. Later discovery of previously unknown problems with a product, including adverse events of unanticipated severity or frequency, or with manufacturing processes, or failure to comply with regulatory requirements, may also result in revisions to the approved labeling to add new safety information; imposition of post-market studies or clinical trials to assess new safety risks; or imposition of distribution or other restrictions under a REMS program. Other potential consequences include, among other things:

- · Restrictions on the marketing or manufacturing of the product, complete withdrawal of the product from the market or product recalls.
- Fines, warning letters or holds on post-approval clinical trials.
- Refusal of the FDA to approve pending NDAs or BLAs or supplements to approved NDAs or BLAs, or suspension or revocation of
 product license approvals.
- Product seizure or detention, or refusal to permit the import or export of products.
- Injunctions or the imposition of civil or criminal penalties.

The FDA strictly regulates marketing, labeling, advertising and promotion of products that are placed on the market. Drugs may be promoted only for the approved indications and in accordance with the provisions of the approved label. The FDA and other agencies actively enforce the laws and regulations prohibiting the promotion of off-label uses, and a company that is found to have improperly promoted off-label uses may be subject to significant liability.

Prescription Drug Marketing Act

The distribution of pharmaceutical products is subject to the Prescription Drug Marketing Act ("PDMA"), which regulates the distribution of drugs and drug samples at the federal level and sets minimum standards for the registration and regulation of drug distributors at the state level. Under the PDMA and state law, states require the registration of manufacturers and distributors who provide pharmaceuticals in that state, including in certain states manufacturers and distributors who ship pharmaceuticals into the state even if such manufacturers or distributors have no place of business within the state. The PDMA and state laws impose requirements and limitations upon drug sampling to ensure accountability in the distribution of samples. The PDMA sets forth civil and criminal penalties for violations of these and other provisions.

Federal and State Fraud and Abuse and Data Privacy and Security and Transparency Laws and Regulations

In addition to FDA restrictions on marketing of pharmaceutical products, federal and state healthcare laws restrict certain business practices in the biopharmaceutical industry. These laws include, but are not limited to, anti-kickback, false claims, data privacy and security, and transparency statutes and regulations.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 279 of 1730

The federal Anti-Kickback Statute prohibits, among other things, knowingly and willfully offering, paying, soliciting or receiving remuneration, directly or indirectly, to induce, or in return for, purchasing, leasing, ordering or arranging for the purchase, lease or order of any good, facility, item or service reimbursable under Medicare, Medicaid or other federal healthcare programs. The term "remuneration" has been broadly interpreted to include anything of value, including for example, gifts, discounts, the furnishing of supplies or equipment, credit arrangements, payments of cash, waivers of payment, ownership interests and providing anything at less than its fair market value. The Anti-Kickback Statute has been interpreted to apply to arrangements between pharmaceutical manufacturers on one hand and prescribers, purchasers and formulary managers on the other. Although there are a number of statutory exemptions and regulatory safe harbors protecting certain common activities from prosecution, the exemptions and safe harbors are drawn narrowly, and our practices may not in all cases meet all of the criteria for a statutory exception or safe harbor protection. Practices that involve remuneration that may be alleged to be intended to induce prescribing, purchases or recommendations may be subject to scrutiny if they do not qualify for an exception or safe harbor. Failure to meet all of the requirements of a particular applicable statutory exception or regulatory safe harbor does not make the conduct per se illegal under the Anti-Kickback Statute. Instead, the legality of the arrangement will be evaluated on a case-by-case basis based on a cumulative review of all of its facts and circumstances. Several courts have interpreted the statute's intent requirement to mean that if any one purpose of an arrangement involving remuneration is to induce referrals of federal healthcare covered business, the statute has been violated. The intent standard under the Anti-Kickback Statute was amended by the Patient Protection and Affordable Care Act as amended by the Health Care and Education Reconciliation Act of 2010 (collectively "PPACA"), to a stricter intent standard such that a person or entity no longer needs to have actual knowledge of this statute or the specific intent to violate it in order to have committed a violation. In addition, PPACA codified case law that a claim including items or services resulting from a violation of the federal Anti-Kickback Statute constitutes a false or fraudulent claim for purposes of the civil False Claims Act (discussed below). Further, civil monetary penalties statute imposes penalties against any person or entity who, among other things, is determined to have presented or caused to be presented a claim to a federal health program that the person knows or should know is for an item or service that was not provided as claimed or is false or fraudulent.

The federal false claims laws prohibit, among other things, any person or entity from knowingly presenting, or causing to be presented, a false or fraudulent claim for payment or approval to the federal government or knowingly making, using or causing to be made or used a false record or statement material to a false or fraudulent claim to the federal government. As a result of a modification made by the Fraud Enforcement and Recovery Act of 2009, a claim includes "any request or demand" for money or property presented to the U.S. government. Recently, several pharmaceutical and other healthcare companies have been prosecuted under these laws for, among other things, allegedly providing free product to customers with the expectation that the customers would bill federal programs for the product. Other companies have been prosecuted for causing false claims to be submitted because of the companies' marketing of the product for unapproved, and thus non-reimbursable, uses. The federal Health Insurance Portability and Accountability Act of 1996 ("HIPAA"), created new federal criminal statutes that prohibit knowingly and willfully executing, or attempting to execute, a scheme to defraud any healthcare benefit program, including private third-party payors and knowingly and willfully falsifying, concealing or covering up a material fact or making any materially false, fictitious or fraudulent statement in connection with the delivery of, or payment for, healthcare benefits, items or services.

In addition, we may be subject to data privacy and security regulation by both the federal government and the states in which we conduct our business. HIPAA, as amended by the Health Information Technology for Economic and Clinical Health Act ("HITECH"), and its implementing regulations, imposes certain requirements relating to the privacy, security and transmission of individually identifiable health information. Among other things, HITECH makes HIPAA's privacy and security standards directly applicable to business associates - independent contractors or agents of covered entities that receive or obtain protected health information in connection with providing a service on behalf of a covered entity. HITECH also created four new tiers of civil monetary penalties, amended HIPAA to make civil and criminal penalties directly applicable to business associates, and gave state attorneys general new authority to file civil actions for damages or injunctions in federal courts to enforce the federal HIPAA laws and seek attorney's fees and costs associated with pursuing federal civil actions. In addition, state laws govern the privacy and security of health information in certain circumstances, many of which differ from each other in significant ways and may not have the same effect, thus complicating compliance efforts.

Additionally, the federal Physician Payments Sunshine Act within the PPACA, and its implementing regulations, require that certain manufacturers of drugs, devices, biologicals and medical supplies for which payment is available under Medicare, Medicaid or the Children's Health Insurance Program (with certain exceptions) to report information related to certain payments or other transfers of value made or distributed to physicians and teaching hospitals, or to entities or individuals at the request of, or designated on behalf of, the physicians and teaching hospitals and to report annually certain ownership and investment interests held by physicians and their immediate family members.

Also, many states have similar healthcare statutes or regulations that apply to items and services reimbursed under Medicaid and other state programs, or, in several states, apply regardless of the payor. Some states require the posting of information relating to clinical studies. In addition, California requires pharmaceutical companies to implement a comprehensive compliance program that includes a limit on expenditures for, or payments to, individual medical or health professionals. If our operations are found to be in violation of any of the health regulatory laws described above or any other laws that apply to us, we may be subject to penalties, including potentially significant criminal, civil and/or administrative penalties, damages, fines, disgorgement, individual imprisonment, exclusion of products from reimbursement under government programs, contractual damages, reputational harm, administrative burdens, diminished profits and future earnings and the curtailment or restructuring of our operations, any of which could adversely affect our ability to operate our business and our results of operations. To the extent that any of our products will be sold in a foreign country, we may be subject to similar foreign laws and regulations, which may include, for instance, applicable post-marketing requirements, including safety surveillance, anti-fraud and abuse laws and implementation of corporate compliance programs and reporting of payments or transfers of value to healthcare professionals.

Pharmaceutical Coverage, Pricing and Reimbursement

In both domestic and foreign markets, our sales of any approved products will depend in part on the availability of coverage and adequate reimbursement from third-party payors. Third-party payors include government health administrative authorities, managed care providers, private health insurers and other organizations. Patients who are prescribed treatments for their conditions and providers performing the prescribed services generally rely on third-party payors to reimburse all or part of the associated healthcare costs. Patients are unlikely to use our products unless coverage is provided and reimbursement is adequate to cover a significant portion of the cost of our products. Sales of our products will therefore depend substantially, both domestically and abroad, on the extent to which the costs of our products will be paid by third-party payors. These third-party payors are increasingly focused on containing healthcare costs by challenging the price and examining the cost-effectiveness of medical products and services. In addition, significant uncertainty exists as to the coverage and reimbursement status of newly approved healthcare product candidates. The market for our products and product candidates for which we may receive regulatory approval will depend significantly on access to third-party payors' drug formularies, or lists of medications for which third-party payors provide coverage and reimbursement. The industry competition to be included in such formularies often leads to downward pricing pressures on pharmaceutical companies. Also, third-party payors may refuse to include a particular branded drug in their formularies or otherwise restrict patient access to a branded drug when a less costly generic equivalent or other alternative is available.

Because each third-party payor individually approves coverage and reimbursement levels, obtaining coverage and adequate reimbursement is a time-consuming, costly and sometimes unpredictable process. We may be required to provide scientific and clinical support for the use of any product to each third-party payor separately with no assurance that approval would be obtained, and we may need to conduct expensive pharmacoeconomic studies in order to demonstrate the cost-effectiveness of our products. This process could delay the market acceptance of any product and could have a negative effect on our future revenues and operating results. We cannot be certain that our products and our product candidates will be considered cost-effective. Because coverage and reimbursement determinations are made on a payor-by-payor basis, obtaining acceptable coverage and reimbursement from one payor does not guarantee that we will obtain similar acceptable coverage or reimbursement from another payor. If we are unable to obtain coverage of, and adequate reimbursement and payment levels for, our product candidates from third-party payors, physicians may limit how much or under what circumstances they will prescribe or administer them and patients may decline to purchase them. This in turn could affect our ability to successfully commercialize our products and impact our profitability, results of operations, financial condition and future success.

In addition, in many foreign countries, particularly the countries of the Europe and China, the pricing of prescription drugs is subject to government control. In some non-U.S. jurisdictions, the proposed pricing for a drug must be approved before it may be lawfully marketed. The requirements governing drug pricing vary widely from country to country. For example, the Europe provides options for its member states to restrict the range of medicinal products for which their national health insurance systems provide reimbursement and to control the prices of medicinal products for human use. A member state may approve a specific price for the medicinal product or it may instead adopt a system of direct or indirect controls on the profitability of a company placing the medicinal product on the market. We may face competition for our product candidates from lower-priced products in foreign countries that have placed price controls on pharmaceutical products. In addition, there may be importation of foreign products that compete with our own products, which could negatively impact our profitability.

Healthcare Reform

In the U.S. and foreign jurisdictions, there have been, and we expect there will continue to be, a number of legislative and regulatory changes to the healthcare system that could affect our future results of operations as we begin to directly commercialize our products. In particular, there have been and continue to be a number of initiatives at the U.S. federal and state level that seek to reduce healthcare costs. If a drug product is reimbursed by Medicare or Medicaid, pricing and rebate programs must comply with, as applicable, the Medicaid rebate requirements of the Omnibus Budget Reconciliation Act of 1990, as amended, and the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 ("MMA"). The MMA imposed new requirements for the distribution and pricing of prescription drugs for Medicare beneficiaries. Under Part D, Medicare beneficiaries may enroll in prescription drug plans offered by private entities that provide coverage of outpatient prescription drugs. Part D plans include both stand-alone prescription drug benefit plans and prescription drug coverage as a supplement to Medicare Advantage plans. Unlike Medicare Part A and B, Part D coverage is not standardized. Part D prescription drug plan sponsors are not required to pay for all covered Part D drugs, and each drug plan can develop its own drug formulary that identifies which drugs it will cover and at what tier or level. However, Part D prescription drug formularies must include drugs within each therapeutic category and class of covered Part D drugs, though not necessarily all the drugs in each category or class. Any formulary used by a Part D prescription drug plan must be developed and reviewed by a pharmacy and therapeutic committee. Government payment for some of the costs of prescription drugs may increase demand for our products for which we receive marketing approval. However, any negotiated prices for our future products covered by a Part D prescription drug plan will likely be lower than the prices we might otherwise obtain from non-governmental payors. Moreover, while the MMA applies only to drug benefits for Medicare beneficiaries, private payors often follow Medicare coverage policy and payment limitations in setting their own payment rates. Any reduction in payment that results from Medicare Part D may result in a similar reduction in payments from non-governmental payors.

Moreover, on November 27, 2013, the federal Drug Supply Chain Security Act was signed into law, which imposes new obligations on manufacturers of pharmaceutical products, among others, related to product tracking and tracing. Among the requirements of this new federal legislation, manufacturers will be required to provide certain information regarding the drug product to individuals and entities to which product ownership is transferred, label drug product with a product identifier, and keep certain records regarding the drug product. Further, under this new legislation, manufacturers will have drug product investigation, quarantine, disposition, and notification responsibilities related to counterfeit, diverted, stolen, and intentionally adulterated products, as well as products that are the subject of fraudulent transactions or which are otherwise unfit for distribution such that they would be reasonably likely to result in serious health consequences or death.

Furthermore, political, economic and regulatory influences are subjecting the healthcare industry in the U.S. to fundamental change. Initiatives to reduce the federal budget and debt and to reform healthcare coverage are increasing cost-containment efforts. We anticipate that Congress, state legislatures and the private sector will continue to review and assess alternative healthcare benefits, controls on healthcare spending through limitations on the growth of private health insurance premiums and Medicare and Medicaid spending, the creation of large insurance purchasing groups, price controls on pharmaceuticals and other fundamental changes to the healthcare delivery system. Any proposed or actual changes could limit or eliminate our spending on development projects and affect our ultimate profitability. In March 2010, PPACA was signed into law. PPACA has the potential to substantially change the way healthcare is financed by both governmental and private insurers. Among other cost containment measures, PPACA established: an annual, nondeductible fee on any entity that manufactures or imports certain branded prescription drugs and biologic agents; revised the methodology by which rebates owed by manufacturers to the state and federal government for covered outpatient drugs under the Medicaid Drug Rebate Program are calculated; increased the minimum Medicaid rebates owed by most manufacturers under the Medicaid Drug Rebate Program; and extended the Medicaid Drug Rebate program to utilization of prescriptions of individuals enrolled in Medicaid managed care organizations. In the future, there may continue to be additional proposals relating to the reform of the U.S. healthcare system, some of which could further limit the prices we are able to charge for our products, or the amounts of reimbursement available for our products. If future legislation were to impose direct governmental price controls and access restrictions, it could have a significant adverse impact on our business. Managed care organizations, as well as Medicaid and other government agencies, continue to seek price discounts. Some states have implemented, and other states are considering, price controls or patient access constraints under the Medicaid program, and some states are considering price-control regimes that would apply to broader segments of their populations that are not Medicaid-eligible. Due to the volatility in the current economic and market dynamics, we are unable to predict the impact of any unforeseen or unknown legislative, regulatory, payor or policy actions, which may include cost containment and healthcare reform measures. Such policy actions could have a material adverse impact on our profitability.

Regulation in China

The pharmaceutical industry in China is highly regulated. The primary regulatory authority is the NMPA, including its provincial and local branches. As a developer, manufacturer and supplier of drugs, we are subject to regulation and oversight by the NMPA and its provincial and local branches. The Drug Administration Law of China provides the basic legal framework for the administration of the production and sale of pharmaceuticals in China and covers the manufacturing, distributing, packaging, pricing and advertising of pharmaceutical products. Its implementing regulations set forth detailed rules with respect to the administration of pharmaceuticals in China. In addition, we are, and we will be, subject to other Chinese laws and regulations that are applicable to business operators, manufacturers and distributors in general.

Pharmaceutical Clinical Development

A new drug must be approved by the NMPA before it can be manufactured and marketed for sale. To obtain NMPA approval, the applicant must conduct clinical trials, which must be approved by the NMPA and are subject to the NMPA's supervision and inspection. There are four phases of clinical trials. Application for registration of new drugs requires completion of Phase 1, 2 and 3 of clinical trials, similar to the U.S. In addition, the NMPA may require the conduct of Phase 4 studies as a condition to approval.

Phase 4 studies are post-marketing studies to assess the therapeutic effectiveness of and adverse reactions to the new drug, including an evaluation of the benefits and risks, when used among the general population or specific groups, with findings used to inform adjustments to dosage, among other things.

NDA and Approval to Market

China requires approval of the NDA as well as the manufacturing facility before a drug can be marketed in China. Approval and oversight are performed at national and provincial levels of the NMPA, involve multiple agencies and consist of various stages of approval.

Under the applicable drug registration regulations, drug registration applications are divided into three different types, namely Domestic NDA, Domestic Generic Drug Application, and Imported Drug Application. Drugs fall into one of three categories, namely chemical medicine, biological product or traditional Chinese or natural medicine.

Our roxadustat NDA for treatment of CKD anemia was submitted by FibroGen Beijing as a domestic entity under the Domestic Class 1 designation, which refers to a new drug which has never been marketed in any country.

Our NDA package in China contained information similar to what is necessary for a U.S. NDA, including preclinical data, clinical data, technical data on API and drug product, and related stability data.

The NDA package was found acceptable to the NMPA, and FibroGen Beijing was granted a New Drug License confirming the drug as suitable for marketing in December 2018. In addition, FibroGen Beijing was granted a Manufacturing License which lists the Drug Approval Code as well as the name and address of the Manufacturing License holder.

Shortly before NDA approval, FibroGen Beijing conducted a three-batch validation campaign, one of which was observed onsite by the NMPA. Following the successful completion of the validation campaign and associated inspection, FibroGen Beijing was granted a cGMP certification for the commercial production of roxadustat at our Beijing manufacturing facility. We are using our FibroGen Beijing manufacturing facility for commercial supply of drug product. Our Cangzhou manufacturing facility has been fully qualified and licensed for manufacture of roxadustat API for the China market, and we will continue to use this facility for commercial supply. We may also qualify a third party manufacturer to produce commercial API under the Marketing Authorization Holder System program.

Pricing, Reimbursement, Hospital Listing, and Tendering

Please see the discussion above in the section "Roxadustat for the Treatment of Anemia in Chronic Kidney Disease in China."

Foreign Regulation Outside of China

We have received marketing authorization for roxadustat in Japan for anemia of CKD in dialysis patients, and in China for dialysis and non-dialysis patients. Astellas has submitted a supplemental NDA for non-dialysis patients in Japan and intends on submitting an MAA for Europe in the first half of 2020. Our partners also intend to submit for marketing authorization in other countries and we may file for marketing authorization for pamrevlumab or roxadustat in other indications and in other countries in the future. In order to market any product outside of the U.S., we would need to comply with numerous and varying regulatory requirements of other countries and jurisdictions regarding quality, safety and efficacy and governing, among other things, clinical trials, manufacturing, marketing authorization, commercial sales and distribution of our products. Whether or not we obtain FDA approval for a product, we would need to obtain the necessary approvals by the comparable foreign regulatory authorities before we can commence clinical trials or marketing of the product in foreign countries and jurisdictions. Although many of the issues discussed above with respect to the U.S. apply similarly in the context of other countries we are seeking approval in, including Europe and China, the approval process varies between countries and jurisdictions and can involve different amounts of product testing and additional administrative review periods. For example, in Europe and in China, a sponsor must submit a clinical trial application ("CTA"), much like an IND prior to the commencement of human clinical trials. A CTA must be submitted to each national health authority and an independent ethics committee.

For other countries outside of the Europe, such as China and the countries in Eastern Europe, Latin America or Asia, the requirements governing the conduct of clinical trials, product licensing, pricing, and reimbursement vary from country to country. The time required to obtain approval in other countries and jurisdictions might differ from or be longer than that required to obtain FDA approval. Regulatory approval in one country or jurisdiction does not ensure regulatory approval in another, but a failure or delay in obtaining regulatory approval in one country or jurisdiction may negatively impact the regulatory approval process in other countries.

Regulatory Exclusivity for Approved Products

U.S. Patent Term Restoration

Depending upon the timing, duration, and specifics of the FDA approval of our product candidates, some of our U.S. patents may be eligible for limited patent term extension under the Drug Price Competition and Patent Term Restoration Act of 1984, commonly referred to as the Hatch-Waxman Act. The Hatch-Waxman Act permits a patent restoration term of up to five years as compensation for patent term lost during product development and the FDA regulatory review process. The patent term restoration period is generally one-half the time between the effective date of an initial IND and the submission date of an NDA or BLA, plus the time between the submission date of the NDA or BLA and the approval of that product candidate application. Patent term restoration cannot, however, extend the remaining term of a patent beyond a total of 14 years from the product's approval date. In addition, only one patent applicable to an approved product is eligible for the extension and the application for the extension must be submitted prior to the expiration of the patent. The U.S. Patent and Trademark Office, in consultation with the FDA, reviews and approves applications for any patent term extension or restoration. In the future, we expect to apply for restoration of patent term for patents relating to each of our product candidates in order to add patent life beyond the current expiration date of such patents, depending on the length of the clinical trials and other factors involved in the filing of the relevant NDA or BLA.

Market exclusivity provisions under the FDCA can also delay the submission or the approval of certain applications of companies seeking to reference another company's NDA or BLA. The Hatch-Waxman Act provides a 5-year period of exclusivity to any approved NDA for a product containing a NCE never previously approved by FDA either alone or in combination with another active moiety. No application or abbreviated NDA directed to the same NCE may be submitted during the 5-year exclusivity period, except that such applications may be submitted after four years if they contain a certification of patent invalidity or non-infringement of the patents listed with the FDA by the innovator NDA.

Biologic Price Competition and Innovation Act

The Biologics Price Competition and Innovation Act of 2009 ("BPCIA"), established an abbreviated pathway for the approval of biosimilar and interchangeable biological products. The abbreviated regulatory approval pathway establishes legal authority for the FDA to review and approve biosimilar biologics, including the possible designation of a biosimilar as "interchangeable" based on similarity to an existing branded product. Under the BPCIA, an application for a biosimilar product cannot be approved by the FDA until 12 years after the original branded product was approved under a BLA. However, an application may be submitted after four years if it contains a certification of patent invalidity or non-infringement to one of the patents listed with the FDA by the innovator BLA holder. The BPCIA is complex and is only beginning to be interpreted and implemented by the FDA. As a result, its ultimate impact, implementation, and interpretation are subject to uncertainty.

Orphan Drug Act

Pamrevlumab has received orphan drug designation in IPF, locally advanced unresectable pancreatic cancer, and DMD in the U.S. Under the Orphan Drug Act, the FDA may grant orphan designation to a drug or biological product intended to treat a rare disease or condition, which is a disease or condition that affects fewer than 200,000 individuals in the U.S., or if it affects more than 200,000 individuals in the U.S. there is no reasonable expectation that the cost of developing and making a drug product available in the U.S. for this type of disease or condition will be recovered from sales of the product. Orphan product designation must be requested before submitting an NDA. After the FDA grants orphan product designation, the identity of the therapeutic agent and its potential orphan use are disclosed publicly by the FDA. Orphan product designation does not convey any advantage in or shorten the duration of the regulatory review and approval process.

If a product that has orphan designation subsequently receives the first FDA approval for the disease or condition for which it has such designation, the product is entitled to orphan product exclusivity, which means that the FDA may not approve any other applications to market the same drug or biological product for the same indication for seven years, except in limited circumstances, such as a showing of clinical superiority to the product with orphan exclusivity. The designation of such drug also entitles a party to financial incentives such as opportunities for grant funding towards clinical trial costs, tax advantages and user-fee waivers. Competitors, however, may receive approval of different products for the indication for which the orphan product has exclusivity or obtain approval for the same product but for a different indication for which the orphan product has exclusivity. Orphan product exclusivity also could block the approval of one of our products for seven years if a competitor obtains approval of the same drug or biological product as defined by the FDA or if our drug candidate is determined to be contained within the competitor's product for the same indication or disease. If a drug product designated as an orphan product receives marketing approval for an indication broader than what is designated, it may not be entitled to orphan product exclusivity in any indication.

The EMA has granted Orphan Medicinal Product Designation to pamrevlumab for the treatment of DMD. Orphan Medicinal Product Designation status in the Europe has similar but not identical benefits in that jurisdiction.

Products receiving orphan designation in the Europe can receive ten years of market exclusivity, during which time no similar medicinal product for the same indication may be placed on the market. The ten-year market exclusivity may be reduced to six years if, at the end of the fifth year, it is established that the product no longer meets the criteria for orphan designation; for example, if the product is sufficiently profitable not to justify maintenance of market exclusivity. Additionally, marketing authorization may be granted to a similar product for the same indication at any time if the second applicant can establish that its product, although similar, is safer, more effective or otherwise clinically superior; the initial applicant consents to a second orphan medicinal product application; or the initial applicant cannot supply enough orphan medicinal product. An orphan product can also obtain an additional two years of market exclusivity in the Europe for pediatric studies. No extension to any supplementary protection certificate can be granted on the basis of pediatric studies for orphan indications.

Foreign Country Data Exclusivity

The Europe also provides opportunities for additional market exclusivity. For example, in the Europe, upon receiving marketing authorization, an NCE generally receives eight years of data exclusivity and an additional two years of market exclusivity. If granted, data exclusivity prevents regulatory authorities in the Europe from referencing the innovator's data to assess a generic application. During the additional two-year period of market exclusivity, a generic marketing authorization can be submitted, and the innovator's data may be referenced, but no generic product can be marketed until the expiration of the market exclusivity.

In China, there is also an opportunity for data exclusivity for a period of six years for data included in an NDA applicable to a NCE. According to the Provisions for Drug Registration, the Chinese government protects undisclosed data from drug studies and prevents the approval of an application made by another company that uses the undisclosed data for the approved drug. In addition, if an approved drug manufactured in China qualifies as an innovative drug, such as Domestic Class 1, and the NMPA determines that it is appropriate to protect public health with respect to the safety and efficacy of the approved drug, the NMPA may elect to monitor such drug for up to five years. During this post-marketing observation period, the NMPA will not grant approval to another company to produce, change dosage form of or import the drug while the innovative drug is under observation. The approved manufacturer is required to provide an annual report to the regulatory department of the province, autonomous region or municipality directly under the central government where it is located. Each of the data exclusivity period and the observation period runs from the date of approval for production of the NCE or innovative drug, as the case may be.

INTELLECTUAL PROPERTY

Our success depends in part upon our ability to obtain and maintain patent and other intellectual property protection for our product candidates including compositions-of-matter, dosages, and formulations, manufacturing methods, and novel applications, uses and technological innovations related to our product candidates and core technologies. We also rely on trade secrets, know-how and continuing technological innovation to further develop and maintain our competitive position.

Our policy is to seek to protect our proprietary position by, among other methods, filing U.S. and foreign patent applications related to our proprietary technologies, inventions and any improvements that we consider important to the development and implementation of our business and strategy. Our ability to maintain and solidify our proprietary position for our products and technologies will depend, in part, on our success in obtaining and enforcing valid patent claims. Additionally, we may benefit from a variety of regulatory frameworks in the U.S., Europe, China, and other territories that provide periods of non-patent-based exclusivity for qualifying drug products. *Refer to "Government Regulation - Regulatory Exclusivity for Approved Products."*

We cannot ensure that patents will be granted with respect to any of our pending patent applications or with respect to any patent applications that may be filed by us in the future, nor can we ensure that any of our existing or subsequently granted patents will be useful in protecting our drug candidates, technological innovations, and processes. Additionally, any existing or subsequently granted patents may be challenged, invalidated, circumvented or infringed. We cannot guarantee that our intellectual property rights or proprietary position will be sufficient to permit us to take advantage of current market trends or otherwise to provide or protect competitive advantages. Furthermore, our competitors may be able to independently develop and commercialize similar products, or may be able to duplicate our technologies, business model, or strategy, without infringing our patents or otherwise using our intellectual property.

Our extensive worldwide patent portfolio includes multiple granted and pending patent applications relating to roxadustat and pamrevlumab. Currently granted patents relating to composition-of-matter for roxadustat and for pamrevlumab are expected, for each product candidate, to expire in 2024 or 2025, in each case exclusive of any patent term extension that may be available. U.S. and foreign patents relating to crystalline forms of roxadustat are expected to expire in 2033, exclusive of any extension. Additional patents and patent applications relating to manufacturing processes, formulations, and various therapeutic uses, including treatment of specific indications and improvement of clinical parameters, provide further protection for product candidates.

The protection afforded by any particular patent depends upon many factors, including the type of patent, scope of coverage encompassed by the granted claims, availability of extensions of patent term, availability of legal remedies in the particular territory in which the patent is granted, and validity and enforceability of the patent. Changes in either patent laws or in the interpretation of patent laws in the U.S. and other countries could diminish our ability to protect our inventions and to enforce our intellectual property rights. Accordingly, we cannot predict with certainty the enforceability of any granted patent claims or of any claims that may be granted from our patent applications.

The biotechnology and pharmaceutical industries are characterized by extensive litigation regarding patents and other intellectual property rights. Our ability to maintain and solidify our proprietary position for our products and core technologies will depend on our success in obtaining effective claims and enforcing those claims once granted. We have been in the past and are currently involved in various administrative proceedings with respect to our patents and patent applications and may, as a result of our extensive portfolio, be involved in such proceedings in the future. Additionally, in the future, we may claim that a third party infringes our intellectual property or a third party may claim that we infringe its intellectual property. In any of the administrative proceedings or in litigation, we may incur significant expenses, damages, attorneys' fees, costs of proceedings and experts' fees, and management and employees may be required to spend significant time in connection with these actions.

Because of the extensive time required for clinical development and regulatory review of a product candidate we may develop, it is possible that any patent related to our product candidates may expire before any of our product candidates can be commercialized, or may remain in force for only a short period of time following commercialization, thereby reducing the advantage afforded by any such patent.

The patent positions for our most advanced programs are summarized below.

Roxadustat Patent Portfolio

Our roxadustat patent portfolio includes multiple granted U.S. patents offering protection for roxadustat, including protection for roxadustat composition-of-matter, for pharmaceutical compositions containing roxadustat, and for methods for treating anemia using roxadustat or its analogs. Exclusive of any patent term extension, the granted U.S. patents relating to the composition-of-matter of roxadustat are due to expire in 2024 or 2025, and granted foreign patents are due to expire in 2024. U.S. and foreign patents relating to crystalline forms of roxadustat are due to expire in 2033.

Oppositions were filed against our European Patent No. 2872488 (the "'488 Patent"), which claims a crystalline form of roxadustat. Final resolution of the opposition proceedings will take time, and we cannot be assured of the breadth of the claims that will remain in the '488 Patent or that the patent will not be revoked in its entirety.

We believe that, if roxadustat is approved, a full five-year patent term extension under the Hatch-Waxman act will be available for a granted U.S. patent relating to roxadustat, which extension would expire in 2029 or 2030, depending on the patent extended. *Refer to "Government Regulation - Regulatory Exclusivity for Approved Products - U.S. Patent Term Restoration."*

We also hold various U.S. and foreign granted patents and pending patent applications directed to manufacturing processes, formulations, and methods for use of roxadustat.

Roxadustat China Patent Portfolio

Our roxadustat China patent portfolio includes granted patents covering roxadustat composition-of-matter, pharmaceutical compositions, methods of use, and manufacturing processes for roxadustat, as well as medicaments containing roxadustat for treating anemia and other conditions. Patents relating to roxadustat composition-of-matter and crystalline forms are due to expire in 2024 and 2033, respectively.

We believe that roxadustat, as a new chemical entity, would be eligible for six years of data exclusivity in China. Furthermore, upon approval as a new drug, roxadustat may receive up to five years of market exclusivity under a NMPA-imposed new drug monitoring period. Refer to "Government Regulation - Regulatory Exclusivity for Approved Products - Foreign Country Data Exclusivity."

HIF Anemia-Related Technologies Patent Portfolio

We also have an extensive worldwide patent portfolio providing broad protection for proprietary technologies relating to the treatment of anemia and associated conditions. This portfolio currently contains granted patents and pending patent applications providing exclusivity for use of compounds falling within various and overlapping classes of HIF-PH inhibitors to achieve various therapeutic effects.

This portfolio reflects a series of discoveries we made from the initial days of our HIF program through the present time. Our research efforts have resulted in progressive innovation, and the corresponding patents and patent applications reflect the success of our HIF program. Such discoveries include the ability of HIF-PH inhibitors:

- To induce endogenous EPO in CKD patients with anemia.
- To increase efficacy of EPO signaling.
- To enhance EPO responsiveness of the bone marrow, for example, by increasing EPO receptor expression.
- To overcome the suppressive and inhibitory effects of inflammatory cytokines, such as members of the interleukin-1 and IL-6 cytokine families, on EPO production and responsiveness.
- To increase effective metabolism of iron.
- To increase iron absorption and bioavailability, as measured using clinical parameters such as percent TSAT%.
- To overcome iron deficiency through effects on iron regulatory factors such as ferroportin and hepcidin.
- · To provide coordinated erythropoiesis resulting in increased CHr and increased mean corpuscular volume.
- To improve kidney function.

The table below sets forth representative granted U.S. patents relating to these and other inventions, including the projected expiration dates of these patents.

PATENT NO.	тпе	DUE TO EXPIRE
6,855,510	Pharmaceuticals and Methods for Treating Hypoxia and Screening Methods Therefor	July 2022
8,466,172	Stabilization of Hypoxia Inducible Factor (HIF) Alpha	December 2022
8,629,131	Enhanced Erythropoiesis and Iron Metabolism	June 2024
8,604,012	Enhanced Erythropoiesis and Iron Metabolism	June 2024
8,609,646	Enhanced Erythropoiesis and Iron Metabolism	June 2024
8,604,013	Enhanced Erythropoiesis and Iron Metabolism	June 2024
8,614,204	Enhanced Erythropoiesis and Iron Metabolism	June 2026
7,713,986	Compounds and Methods for Treatment of Chemotherapy-Induced Anemia	June 2026
8,318,703	Methods for Improving Kidney Function	February 2027

In addition to the U.S. patents listed above, our HIF anemia-related technologies portfolio includes corresponding foreign patents granted and patent applications pending in various territories worldwide.

Akebia and others have filed oppositions against certain European patents within our HIF anemia-related technologies patent portfolio. In three of these proceedings, for FibroGen European Patent Nos. 1463823, 1633333, and 2322155, the European Patent Office has handed down decisions unfavorable to FibroGen. In the fourth of these proceedings, the European Patent Office issued a decision favorable to FibroGen, maintaining FibroGen European Patent No. 2322153 in amended form. All of these decisions are currently under appeal, and these four patents are valid and enforceable pending resolution of the appeals. The ultimate outcomes of such proceedings remain uncertain, and ultimate resolution of such may take considerable time.

In addition, Akebia has filed oppositions against FibroGen European Patent Nos. 2289531 and 2298301. Akebia and GSK have also initiated invalidation actions in the United Kingdom against the United Kingdom counterparts of each of these European patents, and GSK has filed for a declaration of non-infringement of certain United Kingdom patents (corresponding to FibroGen European Patent Nos. 2322153 and 2322155) with respect to its daprodustat product. Akebia is also pursuing invalidation actions against corresponding patents in Canada and in Japan, and invalidation actions against corresponding patents in the United Kingdom have been initiated by GSK and by Akebia, although FibroGen has reached an agreement with GSK that will lead to dismissal of the UK court actions and the proceedings filed by GSK against the patents in the EPO. Astellas' proceedings brought against GSK on a *quia timet* basis have also been dismissed as a result of the settlement agreement. While we believe the ultimate outcome of all proceedings will be that these FibroGen patents will be upheld in relevant part, we note that narrowing or even revocation of any of these patents would not affect our exclusivity for roxadustat or our freedom-to-operate with respect to use of roxadustat for the treatment of anemia.

Pamrevlumab Patent Portfolio

Our pamrevlumab patent portfolio includes U.S. patents providing composition-of-matter protection for pamrevlumab and related antibodies, and for methods of using such in the treatment of fibroproliferative disorders, including IPF, liver fibrosis, and pancreatic cancer. Exclusive of any patent term extension, U.S. patents relating to pamrevlumab composition-of-matter are due to expire in 2024 or 2025. Corresponding foreign patents are due to expire, exclusive of any patent term extension, in 2024.

We believe that, if pamrevlumab is approved, a full five-year patent term extension under the Hatch-Waxman act will be available for a granted patent relating to pamrevlumab, which extension would expire in 2029 or 2030, depending on the patent extended. In addition, we believe that pamrevlumab, if approved under a BLA, should qualify for the 12-year period of exclusivity currently permitted by the BPCIA. Refer to "Government Regulation - Regulatory Exclusivity for Approved Products."

We also hold additional granted U.S. and foreign patents and pending patent applications directed to the use of pamrevlumab to treat IPF, DMD, pancreatic cancer, liver fibrosis, and other disorders.

Trade Secrets and Know-How

In addition to patents, we rely upon proprietary trade secrets and know-how and continuing technological innovation to develop and maintain our competitive position. We seek to protect our proprietary information, in part, using confidentiality and other terms in agreements with our commercial partners, collaboration partners, consultants and employees. Such agreements are designed to protect our proprietary information, and may also grant us ownership of technologies that are developed through a relationship with a third party, such as through invention assignment provisions. Agreements may expire and we could lose the benefit of confidentiality, or our agreements may be breached and we may not have adequate remedies for any breach. In addition, our trade secrets may otherwise become known or be independently discovered by competitors.

To the extent that our commercial partners, collaboration partners, employees and consultants use intellectual property owned by others in their work for us, disputes may arise as to the rights in related or resulting know-how and inventions.

In-Licenses

Dana-Farber Cancer Institute

Effective March 2006, we entered into a license agreement with the Dana-Farber Cancer Institute ("DFCI"), under which we obtained an exclusive license to certain patent applications, patents and biological materials for all uses. The patent rights relate to inhibition of prolyl hydroxylation of the alpha subunit of hypoxia-inducible factor (HIFα), and include granted U.S. and foreign patents due to expire in 2022, exclusive of possible patent term extension. The licensed patents relate to use of HIF-PH inhibitors such as roxadustat.

Under the DFCI agreement, we are obligated to pay DFCI for past and ongoing patent prosecution expenses for the licensed patents. We are also obligated to pay DFCI annual maintenance fees, development milestone payments of up to \$425,000, sales milestone payments of up to \$3 million, and a sub-single-digit royalty on net sales by us or our affiliates or sublicensees of products that are covered by the licensed patents or incorporate the licensed biological materials. In addition, each sublicense we grant is subject to a one-time fixed amount payment to DFCI.

Unless earlier terminated, the agreement will continue in effect, on a country-by-country basis, until the expiration of all licensed patents in a country or, if there is no patent covering a licensed product incorporating the licensed biological materials, until 20 years after the effective date of the agreement. DFCI may terminate the agreement for our uncured material breach, if we cease to carry on our business and development activities with respect to all licensed products, if we fail to comply with our insurance obligations, or if we are convicted of a felony related to the manufacture, use, sale or importation of licensed products. We may terminate the agreement at any time on prior written notice to DFCI.

University of Miami

In May 1997, we entered into a license agreement with the University of Miami (the "University"), amended in July 1999, under which we obtained an exclusive, worldwide license to certain patent applications and patents for all uses. The current patent rights consist of a U.S. patent that relates to antibodies that specifically bind to biologically active fragments of CTGF, and is due to expire in 2022, exclusive of any patent term extension or adjustment that may be available. The licensed patent relates to pamrevlumab and related products.

Under the University agreement, we are obligated to pay for all ongoing patent expenses for the licensed patent. We were also obligated to pay an upfront licensing fee of \$21,500, all of which has been paid, and development milestone payments of up to \$450,000, of which \$150,000 has been paid, as well as an additional milestone payment, in the low hundreds of thousands of dollars, for each new indication for which we obtain approval for a licensed product, and a single digit royalty, subject to certain reductions, on net sales of licensed products by us or our affiliates or sublicensees.

Unless earlier terminated, the agreement will continue in effect, on a country-by-country basis, until the expiration of all licensed patents in a country. The University may terminate the agreement for our uncured material breach or bankruptcy. We may terminate the agreement for the University's uncured material breach or at any time on prior written notice to the University.

Bristol-Myers Squibb Company (Medarex, Inc.)

Effective July 9, 1998 and as amended on June 30, 2001 and January 28, 2002, we entered into a research and commercialization agreement with Medarex, Inc. and its wholly-owned subsidiary GenPharm International, Inc. (now, collectively, part of Bristol-Myers Squibb Company ("Medarex")) to develop fully human monoclonal antibodies for potential anti-fibrotic therapies. Under the agreement, Medarex was responsible for using its proprietary immunizable transgenic mice ("HuMAb-Mouse technology") during a specified research period ("the Research Period"), to produce fully human antibodies against our proprietary antigen targets, including CTGF, for our exclusive use.

The agreement granted us an option to obtain an exclusive worldwide, royalty-bearing, commercial license to develop antibodies derived from Medarex's HuMAb-Mouse technology, for use in the development and commercialization of diagnostic and therapeutic products. In December 2002, we exercised that option with respect to twelve antibodies inclusive of the antibody from which pamrevlumab is derived. We granted back to Medarex an exclusive, worldwide, royalty-free, perpetual, irrevocable license, with the right to sublicense, to certain inventions created during the parties' research collaboration, with such license limited to use by Medarex outside the scope of our licensed antibodies.

As a result of the exercise of our option to obtain the commercial license, Medarex is precluded from (i) knowingly using any technology involving immunizable transgenic mice containing unrearranged human immunoglobulin genes with any of our antigen targets that were the subject of the agreement, (ii) granting to a third party a commercial license that covers such antigen targets or those antibodies derived by Medarex during the Research Period, and (iii) using any antibodies derived by Medarex during the Research Period, except as permitted under the agreement for our benefit or to prosecute patent applications in accordance with the agreement.

Medarex retained ownership of the patent rights relating to certain mice, mice materials, antibodies and hybridoma cell lines used by Medarex in connection with its activities under the agreement, and Medarex also owns certain claims in patents covering inventions that arise during the Research Period, which claims are directed to (i) compositions of matter (e.g., an antibody) except formulations of antibodies for therapeutic or diagnostic use, or (ii) methods of production. We own the patent rights to any inventions that arise during the Research Period that relate to antigens, as well as claims in patents covering inventions directed to (a) methods of use of an antibody, or (b) formulations of antibodies for therapeutic or diagnostic use. Upon exercise of our option to obtain the commercial license, we obtained the sole right but not obligation to control prosecution of patents relating solely to the licensed antibodies or products. Medarex has back-up patent prosecution rights in the event we decline to further prosecute or maintain such patents.

In addition to research support payments by us to Medarex during the Research Period, and an upfront commercial license fee in the form of 181,819 shares of FibroGen Series D Convertible Preferred Stock paid upon exercise of our option, we committed development-related milestone payments of up to \$11 million per therapeutic product containing a licensed antibody, and we have paid a \$1 million development-related milestone, in the form of 133,333 shares of FibroGen Series G Convertible Preferred Stock, and a cash payment of \$2 million, for pamrevlumab to date. At our election, the remaining milestone payments may be paid in common stock of FibroGen, Inc., or cash.

With respect to our sales and sales by our affiliates, the agreement also requires us to pay Medarex low single-digit royalties for licensed therapeutic products and low double-digit royalties plus certain capped sales-based bonus royalties for licensed diagnostic products. With respect to sales of licensed products by a sublicensee, we may elect to pay the foregoing royalties based on our sublicensee's sales, or a percentage (in the high-teens) of all payments received by us from such sublicensee. We are also required to reimburse Medarex any pass-through royalties, if any, payable under Medarex's upstream license agreements with Medical Research Council and DNX. Royalties payable by us under the agreement are on a licensed product-by-licensed product and country-by-country basis and subject to reductions in specified circumstances, and royalties are payable for a period until either expiration of patents covering the applicable licensed product or a specified number of years following the first commercial sale of such product in the applicable country.

Unless earlier terminated, the agreement will continue in effect for as long as there are royalty payment obligations by us or our sublicensees. Either party may terminate the agreement for certain material breaches by the other party, or for bankruptcy, insolvency or similar circumstances. In addition, we may also terminate the agreement for convenience upon written notice.

Third Party Filings

Numerous U.S. and foreign issued patents and pending patent applications, which are owned by third parties, exist in the fields in which we are developing products. Because patent applications can take many years to issue, there may be currently pending applications, unknown to us, which may later result in granted patents that use of our product candidates or proprietary technologies may infringe.

If a third party claims that we infringe its intellectual property rights, we may face a number of issues, including but not limited to, litigation expenses, substantial damages, attorney fees, injunction, royalty payments, cross-licensing of our patents, redesign of our products, or processes and related fees and costs.

We may be exposed to, or threatened with, future litigation by third parties having patent or other intellectual property rights alleging that our products, product candidates, and/or proprietary technologies infringe their intellectual property rights. If one of these patents were to be found to cover our products, product candidates, proprietary technologies, or their uses, we could be required to pay damages and could be restricted from commercializing our products, product candidates or using our proprietary technologies unless we obtain a license to the patent. A license may not be available to us on acceptable terms, if at all. In addition, during litigation, the patent holder might obtain a preliminary injunction or other equitable right, which could prohibit us from making, using or selling our products, technologies, or methods.

EMPLOYEES

As of January 31, 2020, we had 531 full-time employees, 136 of whom held Ph.D. or M.D. degrees, 279 of whom were engaged in research and development and 252 of whom were engaged in manufacturing, sales and marketing, business development, finance, information systems, facilities, human resources or administrative support. None of our U.S. employees are represented by a labor union. The employees of FibroGen Beijing are represented by a labor union under the China Labor Union Law. None of our employees have entered into a collective agreement with us. We consider our employee relations to be good.

FACILITIES

Our corporate and research and development operations are located in San Francisco, California, where we lease approximately 234,000 square feet of office and laboratory space with approximately 35,000 square feet subleased. The lease for our San Francisco headquarters expires in 2023. We also lease approximately 67,000 square feet of office and manufacturing space in Beijing, China. Our lease in China expires in 2021. We have constructed a commercial manufacturing facility of approximately 5,500 square meters in Cangzhou, China, on approximately 33,000 square meters of land. Our right to use such land expires in 2068. We believe our facilities are adequate for our current needs and that suitable additional or substitute space would be available if needed.

LEGAL PROCEEDINGS

We are not currently a party to any material legal proceedings.

FINANCIAL INFORMATION

Information regarding our revenues, net loss and total assets is contained in our consolidated financial statements under Item 8 of this Annual Report, which information is incorporated by reference here. For the specifics of our segment and geographic revenue, refer to Note 14 to our consolidated financial statements.

Research and development expenses for fiscal years ended December 31, 2019, 2018 and 2017 were \$209.3 million, \$235.8 million, and \$196.5 million, respectively. We expect our research and development expenses to continue to increase in the future as we advance our product candidates through clinical trials and expand our product candidate portfolio.

Our revenue to date has been generated primarily from our collaboration agreements with Astellas and AstraZeneca for the development and commercialization of roxadustat. For fiscal years ended December 31, 2019, 2018 and 2017, substantially all of our revenue was related to our collaboration agreements.

AVAILABLE INFORMATION

Our internet website address is www.fibrogen.com. In addition to the information about us and our subsidiaries contained in this Annual Report, information about us can be found on our website. Our website and information included in or linked to our website are not part of this Annual Report.

Our annual reports on Form 10-K, quarterly reports on Form 10-Q, current reports on Form 8-K and amendments to those reports filed or furnished pursuant to Section 13(a) or 15(d) of the Securities Exchange Act of 1934, as amended (the "Exchange Act"), are available free of charge through our website as soon as reasonably practicable after they are electronically filed with or furnished to the Securities and Exchange Commission ("SEC"). Additionally the SEC maintains an internet site that contains reports, proxy and information statements and other information. The address of the SEC's website is www.sec.gov.

CORPORATE INFORMATION

We were incorporated in 1993 in Delaware. Our headquarters are located at 409 Illinois Street, San Francisco, California 94158 and our telephone number is (415) 978-1200. Our website address is www.FibroGen.com. The information contained on, or that can be accessed through, our website is not part of, and is not incorporated into, this Annual Report.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 291 of 1730

Our subsidiaries consist of the following: 1) FibroGen Europe Oy ("FibroGen Europe"), a majority owned entity incorporated in Finland in 1996; 2) Skin Sciences, Inc., a majority owned entity incorporated in the State of Delaware in 1995; 3) FibroGen International (Cayman) Limited, a majority owned entity incorporated in the Cayman Islands in 2011; 4) FibroGen China Anemia Holdings Ltd., a majority owned entity incorporated in the Cayman Islands in 2012; 5) FibroGen International (Hong Kong) Limited, a majority owned entity incorporated in Hong Kong in 2011; and 6) FibroGen (China) Medical Technology Development Co., Ltd., a majority owned entity incorporated in China in 2011.

"FibroGen," the FibroGen logo and other trademarks or service marks of FibroGen, Inc. appearing in this Annual Report are the property of FibroGen, Inc. This Annual Report contains additional trade names, trademarks and service marks of others, which are the property of their respective owners. We do not intend our use of display of other companies' trade names, trademarks or service marks to imply a relationship with, or endorsement or sponsorship of us by, these other companies.

ITEM 1A. RISK FACTORS

Investing in our common stock involves a high degree of risk. You should carefully consider the risks described below in addition to the other information included or incorporated by reference in this Annual Report on Form 10-K, including our consolidated financial statements and the related notes and "Management's Discussion and Analysis of Financial Condition and Results of Operations," before deciding whether to invest in our common stock. The occurrence of any of the events or developments described below could harm our business, financial condition, results of operations and growth prospects. In such an event, the market price of our common stock could decline, and you may lose all or part of your investment. Although we have discussed all known material risks, the risks described below are not the only ones that we may face. Additional risks and uncertainties not presently known to us or that we currently deem immaterial may also impair our business operations.

Risks Related to Our Financial Condition and History of Operating Losses

We have incurred significant losses since our inception and anticipate that we will continue to incur losses for the foreseeable future and may never achieve or sustain profitability. We may require additional financings in order to fund our operations.

We are a biopharmaceutical company with two lead product candidates in clinical development, roxadustat in anemia in chronic kidney disease ("CKD"), myelodysplastic syndromes ("MDS"), and chemotherapy-induced anemia, and pamrevlumab in idiopathic pulmonary fibrosis ("IPF"), pancreatic cancer, and Duchenne muscular dystrophy ("DMD"). Most of our revenue generated to date has been based on our collaboration agreements and we have limited commercial drug product sales to date. We continue to incur significant research and development and other expenses related to our ongoing operations. Our net loss for the year ended December 31, 2019, 2018 and 2017 were \$77.0 million, \$86.4 million and \$120.9 million, respectively. As of December 31, 2019, we had an accumulated deficit of \$784.7 million. As of December 31, 2019, we had capital resources consisting of cash, cash equivalents and short-term investments of \$533.8 million plus \$61.1 million of long-term investments classified as available for sale securities. Despite contractual development and cost coverage commitments from our collaboration partners, AstraZeneca AB ("AstraZeneca") and Astellas Pharma Inc. ("Astellas"), and the potential to receive milestone and other payments from these partners, and despite commercialization efforts in the People's Republic of China ("China") and Japan for roxadustat for the treatment of anemia caused by CKD, we anticipate we will continue to incur losses on an annual basis for the foreseeable future. If we do not successfully develop and continue to obtain regulatory approval for our existing or any future product candidates and effectively manufacture, market and sell the product candidates that are approved, we may never achieve or sustain profitability on a quarterly or annual basis. Our prior losses, combined with expected future losses, have had and will continue to have an adverse effect on our stockholders' equity and working capital. Our failure to become and remain profitable would depress the market price of our common stock and could impair our ability to raise capital, expand our business, diversify our product offerings or continue our operations.

We believe that we will continue to expend substantial resources for the foreseeable future as we continue late-stage clinical development of roxadustat, grow our operations in China, expand our clinical development efforts on pamrevlumab, continue to seek regulatory approval, launch commercialization of our product candidates, and pursue additional indications. These expenditures will include costs associated with research and development, conducting preclinical trials and clinical trials, obtaining regulatory approvals in various jurisdictions, and manufacturing and supplying products and product candidates for ourselves and our partners. The outcome of any clinical trial and/or regulatory approval process is highly uncertain and we are unable to fully estimate the actual costs necessary to successfully complete the development and regulatory approval process for our compounds in development and any future product candidates. We believe that the net proceeds from our 2017 public offerings, our existing cash and cash equivalents, short-term and long-term investments and accounts receivable, and expected third-party collaboration revenues will allow us to fund our operating plans through at least the next 12 months. Our operating plans or third-party collaborations may change as a result of many factors, including the success of our development and commercialization efforts, operations costs (including manufacturing and regulatory), competition, and other factors that may not currently be known to us, and we therefore may need to seek additional funds sooner than planned, through offerings of public or private securities, debt financings or other sources, such as royalty monetization or other structured financings. Such financings may result in dilution to stockholders, imposition of debt covenants and repayment obligations, or other restrictions that may adversely affect our business. We may also seek additional capital due to favorable market conditions or strategic considerations even if we currently believe

Additional funds may not be available when we require them, or on terms that are acceptable to us. If adequate funds are not available to us on a timely basis, we may be required to delay, limit, reduce or terminate our research and development efforts or other operations or activities that may be necessary to commercialize our product candidates.

Most of our recent revenue has been earned from collaboration partners for our product candidates under development.

If either or both of our Astellas and AstraZeneca collaborations were to be terminated, we could require significant additional capital in order to proceed with development and commercialization of our product candidates, including with respect to our commercialization of roxadustat for the treatment of anemia caused by CKD, or we may require additional partnering in order to help fund such development and commercialization. If adequate funds or partners are not available to us on a timely basis or on favorable terms, we may be required to delay, limit, reduce or terminate our development or commercialization efforts or other operations.

Risks Related to the Development and Commercialization of Our Product Candidates

We are substantially dependent on the success of our lead product, roxadustat, and our second compound in development, pamrevlumab.

To date, we have invested a substantial portion of our efforts and financial resources in the research and development of roxadustat and pamrevlumab. While we have received approval of our New Drug Applications ("NDA") for roxadustat in China for CKD anemia for patients on dialysis and not on dialysis, and for roxadustat in Japan for CKD anemia in dialysis patients, we will need to make substantial additional investments in both the development and commercialization of roxadustat worldwide and in various indications. Our near-term prospects, including maintaining our existing collaborations with Astellas and AstraZeneca, will depend heavily on successful development and commercialization of roxadustat, including obtaining regulatory approvals for the commercialization of roxadustat for anemia associated with CKD.

Our other lead product candidate, pamrevlumab, is currently in clinical development for IPF, pancreatic cancer and DMD. Pamrevlumab requires substantial further development and investment and we do not have a collaboration partner for support of this compound. In addition, pamrevlumab is a monoclonal antibody, which may require greater financial resources than for our small molecule, roxadustat.

The clinical and commercial success of roxadustat and pamrevlumab will depend on a number of factors, many of which are beyond our control, and we may be unable to complete the development or commercialization of roxadustat or pamrevlumab.

The clinical and commercial success of roxadustat and pamrevlumab will depend on a number of factors, including the following:

- the timely initiation and completion of our clinical trials;
- our ability to demonstrate the safety and efficacy of our product candidates to the satisfaction of the relevant regulatory authorities;
- the ultimate approval criteria (which may include non-inferiority margins and statistical analyses methods), indications, patient populations, and ultimate benefit-risk analysis used by regulatory authorities in their approval processes;
- whether we are required by the United States ("U.S.") Food and Drug Administration ("FDA") or other regulatory authorities to conduct additional clinical trials, and the scope and nature of such clinical trials, prior to approval to market our products;
- the clinical indications for which the product is approved and the labeling required by regulatory authorities for use with the product, including any warnings that may be required in the labeling;
- the receipt or timely receipt of marketing approvals from the FDA and foreign regulatory authorities, including pricing and reimbursement determinations;
- the ability to successfully commercialize, market, sell and distribute our product candidates, if approved, for marketing and sale by the FDA or foreign regulatory authorities, whether alone or in collaboration with others;
- whether we or our partners are able to recruit and retain adequate numbers of effective sales and marketing personnel for the sale of our products;
- whether we will maintain sufficient funding to cover the costs and expenses associated with creating and sustaining a capable sales and marketing organization and related commercial infrastructure;
- whether we can compete successfully as a new entrant in the treatment of anemia caused by CKD;
- our ability and the ability of our third-party manufacturing partners to manufacture quantities of our product candidates at quality levels necessary to meet regulatory requirements and at a scale sufficient to meet anticipated demand at a cost that allows us to achieve profitability;

- our success in educating health care providers, patients and the healthcare community about the benefits, risks, administration and use of our product candidates, if approved;
- acceptance of our product candidates, if approved, as safe and effective by patients and the healthcare community;
- the success of efforts to enter into relationships with large dialysis organizations involving the administration of roxadustat to dialysis patients;
- the achievement and maintenance of compliance with all regulatory requirements applicable to us and our product candidates;
- the maintenance of an acceptable safety profile of our products following any approval;
- the availability, perceived advantages, relative cost, relative safety, and relative efficacy of alternative and competitive treatments;
- the restrictions on the use of our products together with other medications, if any;
- our ability to negotiate, obtain and sustain an adequate level of pricing or reimbursement for our products by third-party payors;
- the availability of adequate coverage and reimbursement or pricing by third-party payors and government authorities;
- our ability to enforce successfully our intellectual property rights for our product candidates and against the products of potential competitors:
- our ability to avoid or succeed in third-party patent interference or patent infringement claims; and
- sufficient stability data for launch and market supply.

Many of these factors are beyond our control. Successful commercialization of our products will require significant resources and time, and there is a risk that we may not successfully commercialize them. If we do not achieve one or more of these factors in a timely manner or at all, we could experience significant delays or an inability to successfully commercialize our products and generate revenues, which would deprive us from additional working capital and would materially harm our ability to achieve profitability through the sale of or royalties from our product candidates.

As a company, we have limited commercialization experience, and the time and resources to develop such experience are significant. If we fail to achieve and sustain commercial success for roxadustat, either directly or with our collaboration partners, our business would be harmed.

We do not have a sales or marketing infrastructure and have no experience in the sales, marketing or distribution of pharmaceutical products in any country. To achieve commercial success for any product for which we obtain marketing approval, we will need to establish sales and marketing capabilities or make and maintain our existing arrangements with third parties to perform these services at a level sufficient to support our commercialization efforts.

To the extent that we would undertake sales and marketing of any of our products directly, there are risks involved with establishing our own sales, marketing and distribution capabilities. Factors that may inhibit our efforts to commercialize our products on our own include:

- our inability to recruit, train and retain adequate numbers of effective sales and marketing personnel;
- the inability of sales personnel to obtain access to physicians or persuade adequate numbers of physicians to prescribe any future products;
- our inability to effectively manage geographically dispersed sales and marketing teams;
- the lack of complementary products to be offered by sales personnel, which may put us at a competitive disadvantage relative to companies with more extensive product lines; and
- unforeseen costs and expenses associated with creating an independent sales and marketing organization.

With respect to roxadustat, we are dependent on the commercialization capabilities of our collaboration partners, AstraZeneca and Astellas. If either such partner were to terminate its agreement with us, we would have to commercialize on our own or with another third party. We will have limited or little control over the commercialization efforts of such third parties, and any of them may fail to devote the necessary resources and attention to sell and market our products, if any, effectively. If they are not successful in commercializing our product candidates, our business and financial condition would suffer.

Commercializing roxadustat requires us to establish commercialization systems, including but not limited to, medical affairs, sales, pharmacovigilance, supply-chain, and distribution capabilities to perform our portion of the collaborative efforts. These efforts require resources and time. If we, along with Astellas and AstraZeneca, are not successful in setting our marketing, pricing and reimbursement strategy, facilitating adoption by hospitals, recruiting sales and marketing personnel or in building a sales and marketing infrastructure, we will have difficulty commercializing roxadustat, which would adversely affect our business and financial condition.

Although regulatory approval has been obtained for roxadustat in China and Japan, we may be unable to obtain regulatory approval for our product candidates in other countries, or such approval may be delayed or limited, due to a number of factors, many of which are beyond our control.

The clinical trials and the manufacturing of our product candidates are and will continue to be, and the marketing of our product candidates will be, subject to extensive and rigorous review and regulation by numerous government authorities in the U.S. and in other countries where we intend to develop and, if approved, market any product candidates. Before obtaining regulatory approval for the commercial sale of any product candidate, we must demonstrate through extensive preclinical trials and clinical trials that the product candidate is safe and effective for use in each indication for which approval is sought. The regulatory review and approval process is expensive and requires substantial resources and time, and in general very few product candidates that enter development receive regulatory approval. In addition, our collaboration partners for roxadustat have final control over development decisions in their respective territories and they may make decisions with respect to development or regulatory authorities that delay or limit the potential approval of roxadustat, or increase the cost of development or commercialization. Accordingly, we may be unable to successfully develop or commercialize roxadustat or pamrevlumab or any of our other product candidates in one or more indications and jurisdictions.

Moreover, for any Phase 3 clinical trial to support an NDA submission for approval, the FDA and foreign regulatory authorities require compliance with regulations and standards (including good clinical practices ("GCP") requirements for designing, conducting, monitoring, recording, analyzing, and reporting the results of clinical trials) to ensure that (1) the data and results from trials are credible and accurate; and (2) that the rights, integrity and confidentiality of trial participants are protected. Although we rely on third parties to conduct our clinical trials, we as the sponsor remain responsible for ensuring that each of these clinical trials is conducted in accordance with its general investigational plan and protocol under legal and regulatory requirements, including GCP. Regulatory authorities enforce these GCP requirements through periodic inspections of trial sponsors, principal investigators and trial sites. If we or any of our CROs, trial sites, principal investigators or other third parties fail to comply with applicable GCP requirements, the clinical data generated in our clinical trials may be deemed unreliable. Accordingly, the FDA or other regulatory authorities may require us to exclude the use of patient data from these unreliable clinical trials, or perform additional clinical trials before approving our marketing applications. The FDA or other regulatory authorities may even reject our application for approval or refuse to accept our future applications.

Regulatory authorities may take actions or impose requirements that delay, limit or deny approval of our product candidates for many reasons, including, among others:

- our failure to adequately demonstrate to the satisfaction of regulatory authorities that roxadustat is safe and effective in treating anemia in CKD or that pamrevlumab is safe and effective in treating IPF, pancreatic cancer or DMD;
- our failure to demonstrate that a product candidate's clinical and other benefits outweigh its safety risks;
- our failure of clinical trials to meet the level of statistical significance required for approval;
- the determination by regulatory authorities that additional clinical trials are necessary to demonstrate the safety and efficacy of
 roxadustat or pamrevlumab, or that ongoing clinical trials need to be modified in design, size, conduct or implementation;
- our product candidates may exhibit an unacceptable safety signal as they advance through clinical trials, in particular controlled Phase 3 trials;

- the clinical research organizations ("CROs") that conduct clinical trials on our behalf may take actions outside of our control that materially adversely impact our clinical trials;
- we or third-party contractors manufacturing our product candidates may not maintain current good manufacturing practices ("cGMP"), successfully pass inspection or meet other applicable manufacturing regulatory requirements;
- regulatory authorities may not agree with our interpretation of the data from our preclinical trials and clinical trials; or
- collaboration partners may not perform or complete their clinical programs in a timely manner, or at all.

Any of these factors, many of which are beyond our control, could jeopardize our or our collaboration partners' abilities to obtain regulatory approval for our product candidates in one or more indications.

The FDA or other regulatory authorities may require more information (including additional preclinical or clinical data to support approval), which may delay or prevent approval or cause us to abandon the development program altogether. In addition, if our product candidates produce undesirable side effects or safety issues, the FDA may require the establishment of REMS (or other regulatory authorities may require the establishment of a similar strategy), that may restrict distribution of our approved products, if any, and impose burdensome implementation requirements on us.

Preclinical, Phase 1 and Phase 2 clinical trial results may not be indicative of the results that may be obtained in larger, controlled Phase 3 clinical trials required for approval.

Clinical development is expensive and can take many years to complete, and its outcome is inherently uncertain. Failure can occur at any time during the clinical trial process. Success in preclinical and early clinical trials, which are often highly variable and use small sample sizes, may not be predictive of similar results in humans or in larger, controlled clinical trials, and successful results from clinical trials in one indication may not be replicated in other indications.

Many companies in the pharmaceutical and biotechnology industries have suffered significant setbacks in late-stage clinical trials after achieving positive results in early-stage development, and we may face similar setbacks.

We do not know whether our ongoing or planned clinical trials of roxadustat or pamrevlumab will need to be redesigned based on interim results or if we will be able to achieve sufficient patient enrollment or complete planned clinical trials on schedule.

Clinical trials can be delayed or terminated for a variety of reasons, including delay or failure to:

- address any physician or patient safety concerns that arise during the course of the trial;
- obtain required regulatory or institutional review board approval or guidance;
- reach timely agreement on acceptable terms with prospective CROs and clinical trial sites;
- recruit, enroll and retain patients through the completion of the trial;
- maintain clinical sites in compliance with clinical trial protocols;
- initiate or add a sufficient number of clinical trial sites; and
- manufacture sufficient quantities of product candidate for use in clinical trials.

In particular, identifying and qualifying patients to participate in clinical trials of our product candidates is critical to our success. The timing of our clinical trials depends on the rate at which we can recruit and enroll patients in testing our product candidates. Patients may be unwilling to participate in clinical trials of our product candidates for a variety of reasons, some of which may be beyond our control, including:

- severity of the disease under investigation;
- availability of alternative treatments;
- size and nature of the patient population;
- eligibility criteria for and design of the study in question;
- perceived risks and benefits of the product candidate under study;
- ongoing clinical trials of competitive agents;

- physicians' and patients' perceptions of the potential advantages of our product candidates being studied in relation to available therapies or other products under development;
- our CRO's and our trial sites' efforts to facilitate timely enrollment in clinical trials;
- patient referral practices of physicians; and
- ability to monitor patients and collect patient data adequately during and after treatment.

If we have difficulty enrolling a sufficient number of patients to conduct our clinical trials as planned, we may need to delay, limit or terminate ongoing or planned clinical trials.

In addition, we could encounter delays if a clinical trial is suspended or terminated by us, by the relevant institutional review boards at the sites at which such trials are being conducted, or by the FDA or other regulatory authorities. A suspension or termination of clinical trials may result from any number of factors, including failure to conduct the clinical trial in accordance with regulatory requirements or our clinical protocols, inspection of the clinical trial operations or trial site by the FDA or other regulatory authorities resulting in the imposition of a clinical hold, unforeseen safety issues or adverse side effects, changes in laws or regulations, or a principal investigator's determination that a serious adverse event could be related to our product candidates. Any delays in completing our clinical trials will increase the costs of the trial, delay the product candidate development and approval process and jeopardize our ability to commence marketing and generate revenues. Any of these occurrences may materially and adversely harm our business and operations and prospects.

Our product candidates may cause or have attributed to them undesirable side effects or have other properties that delay or prevent their regulatory approval or limit their commercial potential.

Undesirable side effects caused by our product candidates or that may be identified as related to our product candidates by physician investigators conducting our clinical trials or even competing products in development that utilize a similar mechanism of action or act through a similar biological disease pathway could cause us or regulatory authorities to interrupt, delay or halt clinical trials and could result in the delay or denial of regulatory approval by the FDA or other regulatory authorities and potential product liability claims. If we determine that there is a likely causal relationship between a serious adverse event and our product candidate, and such safety event is material or significant enough, it may result in:

- our Phase 3 clinical trial development plan becoming longer and more extensive;
- regulatory authorities increasing the data and information required to approve our product candidates and imposing other requirements; and
- our collaboration partners terminating our existing agreements.

The occurrence of any or all of these events may cause the development of our product candidates to be delayed or terminated, which could materially and adversely affect our business and prospects. Refer to "Business - Roxadustat for the Treatment of Anemia in Chronic Kidney Disease" and "Business - Pamrevlumab for the Treatment of Fibrosis and Cancer" for a discussion of the adverse events and serious adverse events that have emerged in clinical trials of roxadustat and pamrevlumab.

Clinical trials of our product candidates may not uncover all possible adverse effects that patients may experience.

Clinical trials are conducted in representative samples of the potential patient population, which may have significant variability. Clinical trials are by design based on a limited number of subjects and of limited duration for exposure to the product used to determine whether, on a potentially statistically significant basis, the planned safety and efficacy of any product candidate can be achieved. As with the results of any statistical sampling, we cannot be sure that all side effects of our product candidates may be uncovered, and it may be the case that only with a significantly larger number of patients exposed to the product candidate for a longer duration, that a more complete safety profile is identified. Further, even larger clinical trials may not identify rare serious adverse effects or the duration of such studies may not be sufficient to identify when those events may occur. There have been other products, including erythropoiesis stimulating agents ("ESAs"), for which safety concerns have been uncovered following approval by regulatory authorities. Such safety concerns have led to labeling changes or withdrawal of ESAs products from the market. While our most advanced product candidate is chemically unique from ESAs, it or any of our product candidates may be subject to known or unknown risks. Patients treated with our products, if approved, may experience adverse reactions and it is possible that the FDA or other regulatory authorities may ask for additional safety data as a condition of, or in connection with, our efforts to obtain approval of our product candidates. If safety problems occur or are identified after our product candidates reach the market, we may, or regulatory authorities may require us to amend the labeling of our products, recall our products or even withdraw approval for our products.

If we or third-party manufacturers and other service providers on which we rely cannot manufacture sufficient quantities of our product candidates, or at sufficient quality, or perform other services we require, we may experience delays in development, regulatory approval, launch or successful commercialization.

Completion of our clinical trials and commercialization of our product candidates require access to, or development of, facilities to manufacture and manage our product candidates at sufficient yields, quality and at commercial scale. Although we have entered into commercial supply agreements for the manufacture of some of our drug candidates, active pharmaceutical ingredients, intermediates or raw materials, we will need to enter into additional commercial supply agreements, including for backup or second source third-party manufacturers. We may not be able to enter into these agreements with satisfactory terms or on a timely manner.

We have limited experience manufacturing or managing third parties in manufacturing any of our product candidates in the volumes that are expected to be necessary to support large-scale clinical trials and sales. In addition, we have limited experience forecasting supply requirements or coordinating supply chain (including export management) for launch or commercialization, which is a complex process involving our third-party manufacturers and logistics providers, and for roxadustat, our collaboration partners. We may not be able to accurately forecast supplies for commercial launch, or do so in a timely manner and our efforts to establish these manufacturing and supply chain management capabilities may not meet our requirements as to quantities, scale-up, yield, cost, potency or quality in compliance with cGMP, particularly if the marketing authorization or market uptake is more rapid than anticipated.

We have a limited amount of roxadustat and pamrevlumab in storage, limited capacity reserved at our third-party manufacturers, and there are long lead times required to manufacture and scale-up the manufacture of additional supply, as required for both late-stage clinical trials, post-approval trials, and commercial supply. If we are unable to forecast, order or manufacture sufficient quantities of roxadustat or pamrevlumab on a timely basis, it may delay our development, launch or commercialization in some or all indications we are currently pursuing. Any delay or interruption in the supply of our product candidates or products could have a material adverse effect on our business and operations.

Our clinical trials must be conducted with product produced under applicable cGMP regulations. Failure to comply with these regulations may require us to repeat clinical trials, which would delay the regulatory approval process. We, and even an experienced third-party manufacturer, may encounter difficulties in production. Difficulties may include:

- costs and challenges associated with scale-up and attaining sufficient manufacturing yields, in particular for biologic products such as pamrevlumab, which is a monoclonal antibody;
- supply chain issues, including coordination of multiple contractors in our supply chain and securing necessary licenses (such as export licenses);
- the timely availability and shelf life requirements of raw materials and supplies;
- quality control and quality assurance;
- shortages of qualified personnel and capital required to manufacture large quantities of product;
- compliance with regulatory requirements that vary in each country where a product might be sold;
- · capacity or forecasting limitations and scheduling availability in contracted facilities; and
- natural disasters, such as floods, storms, earthquakes, tsunamis, and droughts, or accidents such as fire, that affect facilities, possibly
 limit or postpone production, and increase costs.

The FDA and European Medicines Agency will do their own benefit risk analysis and may reach a different conclusion than we or our partners have internally, and these regulatory authorities may base their approval decision on different analyses, data, and statistical methods than ours.

Even if we believe we have achieved positive clinical results, such as superiority or non-inferiority, in certain endpoints, populations or subpopulations, or using certain statistical methods of analysis, the FDA and European Medicines Agency will each conduct their own benefit-risk analysis and may reach different conclusions, using different statistical methods, different endpoints or definitions thereof, or different patient populations or sub-populations, and regulatory authorities may change their approvability criteria based on their internal analyses and discussions with expert advisors. Regulatory authorities may approve roxadustat for fewer or more limited indications than we request or may grant approval contingent on the performance of costly post-approval clinical trials. While we will present to regulatory authorities certain pre-specified and not pre-specified sub-populations and sub-group analyses (for example, incident dialysis), multiple secondary endpoints, and multiple analytical methods (such as long-term follow up analyses), including adjusted and censored data, regulatory authorities may reject these analyses, methods, or even parts of our trial design or certain data from our studies, the rationale for our pre-specified non-inferiority margins or other portions of our statistical analysis plans. In addition, even if we are able to provide positive data with respect to certain analyses, such as incident dialysis, estimated glomerular filtration rate, hepcidin, or quality of life measures, regulatory authorities may not include such claims on any approved labeling for roxadustat, which may limit the commercialization or market opportunity for roxadustat. The failure to obtain regulatory approval, or any label, population or other approval limitations in any jurisdiction, may significantly limit our ability to generate revenues, and any failure to obtain such approval for all of the indications and labeling claims we deem desirable could reduce our potential revenue.

Even if we are able to obtain regulatory approval of our product candidates, the label we obtain may limit the indicated uses for which our product candidates may be marketed.

With respect to roxadustat, regulatory approvals obtained, could limit the approved indicated uses for which roxadustat may be marketed. For example, our label approved in Japan, includes the following warning: "Serious thromboembolism such as cerebral infarction, myocardial infarction, and pulmonary embolism may occur, possibly resulting in death, during treatment with roxadustat." Additionally, in the U.S., ESAs have been subject to significant safety warnings, including the "Black Box" warnings on their labels. The safety concerns relating to ESAs may result in labeling for roxadustat containing similar warnings even if our Phase 3 clinical trials do not suggest that roxadustat has similar safety issues. Even if the label for roxadustat does not contain all of the warnings contained in the "Black Box" warning for ESAs, the label for roxadustat may contain other warnings or limit the market opportunity or approved indications for roxadustat. These warnings could include warnings against exceeding specified hemoglobin targets and other warnings that derive from the lack of clarity regarding the safety issues associated with ESAs, even if our Phase 3 clinical trials do not themselves raise safety concerns.

We face substantial competition, which may result in others discovering, developing or commercializing products before, or more successfully, than we do.

The development and commercialization of new pharmaceutical products is highly competitive. Our future success depends on our ability to achieve and maintain a competitive advantage with respect to the development and commercialization of our product candidates. Our objective is to discover, develop and commercialize new products with superior efficacy, convenience, tolerability, and safety. We expect that in many cases, the products that we commercialize will compete with existing, market-leading products of companies that have large, established commercial organizations.

If roxadustat is approved and launched commercially, competing drugs are expected to include ESAs, particularly in those patient segments where ESAs are used. Currently available ESAs include epoetin alfa (EPOGEN ®, marketed by Amgen Inc. in the U.S., Procrit ® and Erypo ®/Eprex ®, marketed by Johnson & Johnson Inc., and Espo ® marketed by Kyowa Hakko Kirin in Japan and China), darbepoetin (Amgen/Kyowa Hakko Kirin's Aranesp ® and NESP ®) and Mircera ® marketed by Hoffmann-La Roche ("Roche") outside of the U.S. and by Vifor Pharma, a Roche licensee, in the U.S. and Puerto Rico, as well as biosimilar versions of these currently marketed ESA products. ESAs have been used in the treatment of anemia in CKD for more than 20 years, serving a significant majority of dialysis-dependent CKD patients. While non-dialysis-dependent CKD patients who are not under the care of nephrologists, including those with diabetes and hypertension, do not typically receive ESAs and are often left untreated, some patients under nephrology care may be receiving ESA therapy. It may be difficult to encourage healthcare providers and patients to switch to roxadustat from products with which they have become familiar.

We may also face competition from potential new anemia therapies currently in clinical development, including in those patient segments not currently addressed by ESAs. Companies that are currently developing HIF-PH inhibitors for anemia in CKD indications include GlaxoSmithKline plc ("GSK"), Bayer Corporation ("Bayer"), Akebia Therapeutics, Inc. ("Akebia"), Japan Tobacco, and Zydus Cadila. Akebia is currently conducting Phase 3 studies in CKD patients on dialysis and not on dialysis, as well as a Phase 2 study evaluating pharmacokinetics and pharmacodynamics in dialysis-dependent patients with three-times weekly versus once-a-day dosing. Akebia expects to complete these studies by August 2020. In Japan, Mitsubishi Tanabe Pharmaceutical Corporation, Akebia's collaboration partner, submitted an NDA for treatment of anemia in dialysis and non-dialysis CKD patients in July 2019, and is awaiting an approval decision later in 2020. GSK is also conducting global Phase 3 studies in CKD patients on dialysis and not on dialysis, and expects to complete those studies by March 2022. GSK and Kyowa Hakko Kirin announced in November 2018 that the two companies signed a strategic commercialization deal in Japan for daprodustat. GSK submitted a Japan NDA for treatment of anemia in dialysis and non-dialysis in August 2019 and is awaiting approval later in 2020. Bayer has completed global Phase 2 studies and its HIF-PH inhibitor is now in Phase 3 development in CKD populations on dialysis and not on dialysis in Japan. Japan Tobacco submitted an NDA for treatment of anemia associated with CKD in Japan in November 2019, supported by the six Phase 3 studies conducted in CKD patients on dialysis and not on dialysis in Japan, and its partner JW Pharmaceuticals started a Phase 3 study in dialysis patients in Korea. Zydus Cadila (India) started Phase 3 studies in dialysis and non-dialysis CKD patients in India in 2019.

In addition, there are other companies developing biologic therapies for the treatment of other anemia indications that we may also seek to pursue in the future, including anemia of MDS. For example, Acceleron Pharma, Inc., in partnership with Celgene Corporation, a Bristol-Myers Squibb company ("Celgene"), developed Reblozyl® (luspatercept), a protein therapeutic, which was approved in November 2019 by the FDA for anemia treatment in patients with \(\beta\)-thalassemia. Its Biologics License Application ("BLA") under review by the FDA, for treatment of adult patients with very low to intermediate MDS associated anemia who have ring sideroblast and require red blood cell transfusions, has a Prescription Drug User Fee Act date of April 4, 2020. Acceleron expects an EMA decision on the MAA in the second half of 2020. In Japan, Celgene started a luspatercept Phase 2 study in May 2019. We may face competition for patient recruitment, enrollment for clinical trials, and potentially in commercial sales. There may also be new therapies for renal-related diseases that could limit the market or level of reimbursement available for roxadustat if and when it is commercialized.

In China, biosimilars of epoetin alfa are offered by Chinese pharmaceutical companies such as EPIAO marketed by 3SBio Inc. as well as more than 15 other local manufacturers. We may also face competition by HIF-PH inhibitors from other companies such as Akebia, Bayer, and GSK, which was authorized by the National Medical Products Administration ("NMPA") to conduct trials in China to support its ex-China regulatory filings. Two domestic companies, Jiangsu Hengrui Medicine Co., Ltd. and Guandong Sunshine Health Investment Co., Ltd, have been permitted by the NMPA to conduct clinical trials for CKD anemia patients both on dialysis and not on dialysis, and 3SBio Inc. has submitted a clinical trial application to the NMPA to initiate trials for their HIF-PH inhibitor. Another domestic company, China Medical System, in-licensed desidustat, a compound which is currently in Phase 3 trials in India, from Zydus Candila for greater China in January 2020. Akebia announced in December 2015 that it had entered into a development and commercialization partnership with Mitsubishi Tanabe Pharmaceutical Corporation for its HIF-PH inhibitor vadadustat in Japan, Taiwan, South Korea, India and certain other countries in Asia, and announced in April 2017 an expansion of their U.S. collaboration with Otsuka to add markets, including China. 3SBio Inc. announced in 2016 its plan to begin a Phase 1 clinical trial of a HIF-PH inhibitor for the China market.

The first biosimilar ESA, Pfizer's Retacrit® (epoetin zeta), entered the U.S. market in November 2018. Market penetration of Retacrit and the potential addition of other biosimilar ESAs currently under development may alter the competitive and pricing landscape of anemia therapy in CKD patients on dialysis under the ESRD bundle. The patents for Amgen's EPOGEN® (epoetin alfa) expired in 2004 in the Europe, and the final material patents in the U.S. expired in May 2015. Several biosimilar versions of currently marketed ESAs are available for sale in the Europe, China and other territories. In the U.S., a few ESA biosimilars are currently under development. Sandoz, a division of Novartis, markets Binocrit® (epoetin alfa) in Europe and may file a biosimilar BLA in the U.S.

The majority of the current CKD anemia market focuses on dialysis patients, who visit dialysis centers on a regular basis, typically three times a week, and anemia therapies are administered as part of the visit. Two of the largest operators of dialysis clinics in the U.S., DaVita Healthcare Partners Inc. ("DaVita"), and Fresenius Medical Care AG & Co. KGaA ("Fresenius"), collectively provide dialysis care to more than 80% of U.S. dialysis patients, and therefore have historically won long-term contracts including rebate terms with Amgen. DaVita has a six-year sourcing and supply agreement with Amgen effective through 2022. Fresenius' contract with Amgen expired in 2015, following which Fresenius is providing Roche's ESA Mircera® to a significant portion of its U.S. dialysis patients. Successful penetration in this market may require a significant agreement with Fresenius or DaVita, on favorable terms and on a timely basis.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 301 of 1730

If approved and launched commercially to treat IPF, pamrevlumab is expected to compete with Roche's Esbriet® (pirfenidone), and Boehringer Ingelheim's Ofev® (nintedanib). We believe that if pamrevlumab can be shown to safely stabilize or reverse lung fibrosis, and thus stabilize or improve lung function in IPF patients, it can compete with pirfenidone and nintedanib for market share in IPF. However, it may be difficult to encourage treatment providers and patients to switch to pamrevlumab from a product they are already familiar with. We may also face competition from potential new IPF therapies in recruitment and enrollment in our clinical trials and potentially in commercialization.

Pamrevlumab is an injectable protein, which may be more expensive and less convenient than small molecules such as nintedanib and pirfenidone. Other potential competitive product candidates in various stages of development for IPF include Galapagos NV's GLPG1690 and GLPG1205, Kadmon Holdings, Inc.'s KD025, Liminal BioSciences' PBI-4050, and Roche/Promedior, Inc.'s PRM-151. In particular, GLPG1690 is in a Phase 3 program consisting of two clinical trials with 750 subjects each, intended to support both the U.S. NDA and MAA in Europe.

If pamrevlumab is approved and launched commercially to treat locally advanced pancreatic cancer patients who are not candidates for surgical resection, pamrevlumab may face competition from other products seeking approval in combination with gemcitibine and nab-paclitaxel, including FOLFRINOX, a combination chemotherapy regimen of folic acid, 5-fluouracil, oxaliplatin and irinotecan, and from companies such as Rafael Pharma's defactinib/CPI-613 and Merrimack's istiratumab. Gemcitabine and/or nab-paclitaxel are the current standard of care in the first-line treatment of metastatic pancreatic cancer. Celgene Corporation's Abraxane® (nab-paclitaxel) was launched in the U.S. and Europe in 2013 and 2014, and was the first drug approved in this disease in nearly a decade.

If approved and launched commercially to treat DMD, pamrevlumab is expected to face competition from drugs that have been approved in major markets such as the U.S., EU, and Japan. On September 19, 2016, the FDA approved Sarepta Therapeutics Inc.'s ("Sarepta") Exondys 51TM (eteplirsen). This was the first drug approved to treat DMD. Exondys 51 is approved to treat patients who have a mutation of the dystrophin gene amenable to exon 51 skipping, representing approximately 13% of patients with DMD. In Europe, Sarepta received a negative opinion for its marketing application for eteplirsen from the EMA in September 2018. Sarepta has reported a full year Exondys 51 revenue of \$380 million in 2019. Sarepta's Vyondys 53TM (golodirsen) was also approved by the FDA in December 2019 for patients with a confirmed genetic mutation that is amenable to exon 53 skipping, which accounts for 8% of the DMD population.

PTC Therapeutics' product Translarna TM received a conditional approval in Europe in 2014, which was renewed in November 2016 with a request for a new randomized placebo-controlled 18-month study by the Committee for Medicinal Products for Human Use of the EMA; however, the FDA informed the sponsor in a complete response letter in October 2017, as well as in its response to PTC Therapeutics' appeal, that the FDA is unable to approve the application in its current form. While Translarna TM targets a different set of DMD patients from those targeted by Sarepta's Exondys 51®, it is also limited to a subset of patients who carry a specific mutation. Conversely, pamrevlumab is intended to treat DMD patients without limitation to type of mutation.

Pamrevlumab may also face competition from other drugs currently in clinical development in patient recruiting and enrollment in clinical trials, and, if approved, in commercialization. Examples of those compounds currently under clinical development are the drug candidates from Catabasis Pharmaceuticals ("Catabasis"), Santhera Pharmaceuticals ("Santhera") and Sarepta. Catabasis' edasalonexent was reported to have preserved muscle function and slowed the progression of DMD compared to rates of change in the control period prior to treatment with edasalonexent in a Phase 2 study, and is currently undergoing Phase 3 development. Santhera's Puldysa® (idebenone) MAA for treatment of DMD was filed with the EMA, and the opinion from the Committee for Medicinal Products for Human Use is expected in the second quarter of 2020. The FDA requested additional clinical data from the idebenone Phase 3 trial currently ongoing in the U.S. and Europe. Santhera offers compassionate use of idebenone in patients with DMD in U.S. and UK. Sarepta's SRP-9001 is an investigational gene therapy for DMD. Sarepta announced in December 2019 the licensing agreement with Roche that grants Roche the commercial rights to SRP-9001 outside the U.S.

The success of any or all of these potential competitive products may negatively impact the development and potential for success of pamrevlumab. In addition, any competitive products that are on the market or in development may compete with pamrevlumab for patient recruitment and enrollment for clinical trials or may force us to change our clinical trial design, including, in order to compare pamrevlumab against another drug, which may be the new standard of care.

Moreover, many of our competitors have significantly greater resources than we do. Large pharmaceutical companies, in particular, have extensive experience in clinical testing, obtaining regulatory approvals, recruiting patients, manufacturing pharmaceutical products, and commercialization. In the potential anemia market for roxadustat, for example, large and established companies such as Amgen and Roche, among others, compete aggressively to maintain their market shares. In particular, the currently marketed ESA products are supported by large pharmaceutical companies that have greater experience and expertise in commercialization in the anemia market, including in securing reimbursement, government contracts and relationships with key opinion leaders; conducting testing and clinical trials; obtaining and maintaining regulatory approvals and distribution relationships to market products; and marketing approved products. These companies also have significantly greater scale, research and marketing capabilities than we do and may also have products that have been approved or are in later stages of development and have collaboration agreements in our target markets with leading dialysis companies and research institutions. These competitors have in the past successfully prevented new and competing products from entering the anemia market, and we expect that their resources will represent challenges for us and our collaboration partners, AstraZeneca and Astellas. If we and our collaboration partners are not able to compete effectively against existing and potential competitors, our business and financial condition may be materially and adversely affected.

No or limited reimbursement or insurance coverage of our approved products, if any, by third-party payors may render our products less attractive to patients and healthcare providers.

Market acceptance and sales of any approved products will depend significantly on reimbursement or coverage of our products by government or third-party payors and may be affected by existing and future healthcare reform measures or prices of related products for which the government or third-party reimbursement applies. Coverage and reimbursement by the government or a third-party payor may depend upon a number of factors, including the payor's determination that use of a product is:

- a covered benefit under its health plan;
- safe, effective and medically necessary;
- appropriate for the specific patient;
- · cost-effective; and
- · neither experimental nor investigational.

Obtaining coverage and reimbursement approval for a product from a government or other third-party payor is a time consuming and costly process that could require us to provide supporting scientific, clinical and cost-effectiveness data for the use of our products to the payor, which we may not be able to provide. Furthermore, the reimbursement policies of third-party payors may significantly change in a manner that renders our clinical data insufficient for adequate reimbursement or otherwise limits the successful marketing of our products. Even if we obtain coverage for our product candidates, third-party payors may not establish adequate reimbursement amounts, which may reduce the demand for, or the price of, our products. For example, the initial roxadustat reimbursement prices set by the Ministry of Health, Labour and Welfare in Japan in November 2019 did not reflect innovation premium over the current ESA therapy, despite roxadustat's advantages observed in our clinical programs. We believe the Japanese authority's decision was primarily based on the comparability of roxadustat shown in the Japan Phase 3 studies which supported the Japan NDA, that was not designed to evaluate the outcome and additional efficacy and safety data observed in the large global Phase 3 programs that included over 8,000 patients. We have no control over whether the agency will revisit the pricing once they review the comprehensive data from the global Phase 3 program including the MACE/MACE+ outcomes. If reimbursement is not available or is available only to limited levels or only in subsets of the dialysis and non-dialysis populations, we may not be able to successfully commercialize certain of our products, or in particular jurisdictions.

Price controls may limit the price at which products such as roxadustat, if approved, are sold. For example, reference pricing is used by various Europe member states and parallel distribution, or arbitrage between low-priced and high-priced member states, can further reduce prices. In some countries, we or our partner may be required to conduct a clinical trial or other studies that compare the cost-effectiveness of our product candidates to other available products in order to obtain or maintain reimbursement or pricing approval. Publication of discounts by third-party payors or authorities may lead to further pressure on the prices or reimbursement levels within the country of publication and other countries. If reimbursement of our products is unavailable or limited in scope or amount, or if pricing is set at unacceptable levels, we or our partner may elect not to commercialize our products in such countries, and our business and financial condition could be adversely affected.

Risks Related to Our Reliance on Third Parties

If our collaborations with our collaboration partners Astellas or AstraZeneca were terminated, if Astellas or AstraZeneca were to prioritize other initiatives over their collaborations with us, whether as a result of a change of control or otherwise, if conflicts arise between us and Astellas or AstraZeneca, or if Astellas or AstraZeneca becomes our competitor in the future, our ability to successfully develop and commercialize our product candidates would suffer.

We have entered into collaboration agreements with respect to the development and commercialization of our lead product candidate, roxadustat, with our collaboration partners Astellas and AstraZeneca. These agreements provide for reimbursement of our development costs by our collaboration partners and also provide for commercialization of roxadustat throughout the major territories of the world.

Our agreements with Astellas and AstraZeneca provide each of them with the right to terminate their respective agreements with us, upon the occurrence of negative clinical results, delays in the development and commercialization of our product candidates or adverse regulatory requirements or guidance. The termination of any of our collaboration agreements would require us to fund and perform the further development and commercialization of roxadustat in the affected territory, or pursue another collaboration, which we may be unable to do, either of which could have an adverse effect on our business and operations. In addition, each of those agreements provides our respective partners the right to terminate any of those agreements upon written notice for convenience. Moreover, if Astellas or AstraZeneca, or any successor entity, were to determine that their collaborations with us are no longer a strategic priority, or if either of them or a successor were to reduce their level of commitment to their collaborations with us, our ability to develop and commercialize roxadustat could suffer. In addition, some of our collaborations are exclusive and preclude us from entering into additional collaboration agreements with other parties in the area or field of exclusivity.

If we fail to establish and maintain strategic collaborations related to our product candidates, we will bear all of the risk and costs related to the development and commercialization of any such product candidate, and we may need to seek additional financing, hire additional employees and otherwise develop expertise at significant cost. This in turn may negatively affect the development of our other product candidates as we direct resources to our most advanced product candidates.

Our collaboration partners also have certain rights to control decisions regarding the development and commercialization of our product candidates with respect to which they are providing funding. If we have a disagreement over strategy and activities with our collaboration partners, our plans for obtaining approval may be revised and negatively affect the anticipated timing and potential for success of our product candidates. Even if a product under a collaboration agreement is approved, we will remain substantially dependent on the commercialization strategy and efforts of our collaboration partners, and neither of our collaboration partners has experience in commercialization of a novel drug such as roxadustat in the dialysis market.

With respect to our collaboration agreements for roxadustat, there are additional complexities in that we and our collaboration partners, Astellas and AstraZeneca, must reach consensus on our regulatory activities, including for the NDA in the U.S. and the Marketing Authorization Application in Europe. Multi-party decision-making is complex and involves significant time and effort, and there can be no assurance that the parties will cooperate or reach consensus, or that one or both of our partners will not ask to proceed independently in some or all of their respective territories or functional areas of responsibility in which the applicable collaboration partner would otherwise be obligated to cooperate with us. Any disputes or lack of cooperation with us by either Astellas or AstraZeneca may negatively impact the timing or success of our regulatory approval applications.

We intend to conduct proprietary research programs in specific disease areas that are not covered by our collaboration agreements. Our pursuit of such opportunities could, however, result in conflicts with our collaboration partners in the event that any of our collaboration partners takes the position that our internal activities overlap with those areas that are exclusive to our collaboration agreements. Moreover, disagreements with our collaboration partners could develop over rights to our intellectual property. In addition, our collaboration agreements may have provisions that give rise to disputes regarding the rights and obligations of the parties. Any conflict with our collaboration partners could lead to the termination of our collaboration agreements, delay collaborative activities, reduce our ability to renew agreements or obtain future collaboration agreements or result in litigation or arbitration and would negatively impact our relationship with existing collaboration partners.

Certain of our collaboration partners could also become our competitors in the future. If our collaboration partners develop competing products, fail to obtain necessary regulatory approvals, terminate their agreements with us prematurely or fail to devote sufficient resources to the development and commercialization of our product candidates, the development and commercialization of our product candidates and products could be delayed.

We rely on third parties for the conduct of most of our preclinical and clinical trials for our product candidates, and if our third-party contractors do not properly and successfully perform their obligations under our agreements with them, we may not be able to obtain or may be delayed in receiving regulatory approvals for our product candidates.

We rely heavily on university, hospital, dialysis centers and other institutions and third parties, including the principal investigators and their staff, to carry out our clinical trials in accordance with our clinical protocols and designs. We also rely on a number of third-party CROs to assist in undertaking, managing, monitoring and executing our ongoing clinical trials, including those for roxadustat. We expect to continue to rely on CROs, clinical data management organizations, medical institutions and clinical investigators to conduct our development efforts in the future, including our Phase 3 development program for roxadustat. We compete with many other companies for the resources of these third parties, and large pharmaceutical companies often have significantly more extensive agreements and relationships with such third-party providers, and such third-party providers may prioritize the requirements of such large pharmaceutical companies over ours. The third parties on whom we rely may terminate their engagements with us at any time, which may cause delay in the development and commercialization of our product candidates. If any such third party terminates its engagement with us or fails to perform as agreed, we may be required to enter into alternative arrangements, which would result in significant cost and delay to our product development program. Moreover, our agreements with such third parties generally do not provide assurances regarding employee turnover and availability, which may cause interruptions in the research on our product candidates by such third parties.

Moreover, while our reliance on these third parties for certain development and management activities will reduce our control over these activities, it will not relieve us of our responsibilities. For example, the FDA and foreign regulatory authorities require compliance with regulations and standards, including GCP requirements for designing, conducting, monitoring, recording, analyzing and reporting the results of clinical trials to ensure that the data and results from trials are credible and accurate and that the rights, integrity and confidentiality of trial participants are protected. Although we rely on third parties to conduct our clinical trials, we, as the sponsor, remain responsible for ensuring that each of these clinical trials is conducted in accordance with its general investigational plan and protocol under legal and regulatory requirements, including GCP. Regulatory authorities enforce these GCP requirements through periodic inspections of trial sponsors, principal investigators and trial sites.

If any of our CROs, trial sites, principal investigators or other third parties fail to comply with applicable GCP requirements, other regulations, trial protocol or other requirements under their agreements with us, the quality or accuracy of the data they obtain may be compromised or unreliable, and the trials of our product candidates may not meet regulatory requirements. If trials do not meet regulatory requirements or if these third parties need to be replaced, the development of our product candidates may be delayed, suspended or terminated, regulatory authorities may require us to exclude the use of patient data from our approval applications or perform additional clinical trials before approving our marketing applications. Regulatory authorities may even reject our application for approval or refuse to accept our future applications for an extended time period. We cannot assure that upon inspection by a regulatory authority, such regulatory authority will determine that any of our clinical trials comply with GCP requirements or that our results may be used in support of our regulatory submissions. If any of these events occur, we may not be able to obtain regulatory approval for our product candidates on a timely basis, at a reasonable cost, or at all.

We currently rely, and expect to continue to rely, on third parties to conduct many aspects of our product manufacturing and distribution, and these third parties may not perform satisfactorily.

We do not have operating manufacturing facilities at this time other than our roxadustat manufacturing facility in China, and our current commercial manufacturing facility plans in China are not expected to satisfy the requirements necessary to support development and commercialization outside of China. Other than in and for China specifically, we do not expect to independently manufacture our products. We currently rely, and expect to continue to rely, on third parties to scale-up, manufacture and supply roxadustat and our other product candidates outside of China. We also rely entirely on third parties for distribution in China. Risks arising from our reliance on third-party manufacturers include:

- reduced control and additional burdens of oversight as a result of using third-party manufacturers and distributors for all aspects of
 manufacturing activities, including regulatory compliance and quality control and quality assurance;
- termination of manufacturing agreements, termination fees associated with such termination, or nonrenewal of manufacturing
 agreements with third parties may negatively impact our planned development and commercialization activities;
- · the possible misappropriation of our proprietary technology, including our trade secrets and know-how; and
- disruptions to the operations of our third-party manufacturers, distributors or suppliers unrelated to our product, including the merger, acquisition, or bankruptcy of a manufacturer or supplier or a catastrophic event affecting our manufacturers, distributors or suppliers.

Any of these events could lead to development delays or failure to obtain regulatory approval or affect our ability to successfully commercialize our product candidates. Some of these events could be the basis for action by the FDA or another regulatory authority, including injunction, recall, seizure or total or partial suspension of production.

The facilities used by our contract manufacturer to manufacture our product candidates must pass inspections by the FDA and other regulatory authorities. Although, except for China, we do not control the manufacturing operations of, and expect to remain completely dependent on, our contract manufacturers for manufacture of drug substance and finished drug product, we are ultimately responsible for ensuring that our product candidates are manufactured in compliance with cGMP requirements. If our contract manufacturers cannot successfully manufacture material that conforms to our or our collaboration partners' specifications, or the regulatory requirements of the FDA or other regulatory authorities, we may not be able to secure and/or maintain regulatory approval for our product candidates and our development or commercialization plans may be delayed. In addition, we have no control over the ability of our contract manufacturers to maintain adequate quality control, quality assurance and qualified personnel. In addition, although our longer-term agreements are expected to provide for requirements to meet our quantity and quality requirements to manufacture our products candidates for clinical studies and commercial sale, we will have minimal direct control over the ability of our contract manufacturers to maintain adequate quality control, quality assurance and qualified personnel and we expect to rely on our audit rights to ensure that those qualifications are maintained to meet our requirements. If our contract manufacturers' facilities do not pass inspection by regulatory authorities, or if regulatory authorities do not approve these facilities for the manufacture of our products, or withdraw any such approval in the future, we would need to identify and qualify alternative manufacturing facilities, which would significantly impact our ability to develop, obtain regulatory approval for or market our products, if approved. Moreover, any failure of our third-party manufacturers, to comply with applicable regulations could result in sanctions being imposed on us or adverse regulatory consequences, including clinical holds, warnings or untitled letters, fines, injunctions, civil penalties, delays, suspension or withdrawal of approvals, license revocation, seizures or recalls of product candidates or products, operating restrictions and criminal prosecutions, any of which would be expected to significantly and adversely affect supplies of our products to us and our collaboration partners.

Other than for Catalent, our commercial third-party supplier of roxadustat drug product in the U.S. and Europe, most of our other third-party manufacturers may terminate their engagement with us at any time and we have not yet entered into any commercial supply agreements for the manufacture of drug substance or active pharmaceutical ingredient ("API") or drug products. With respect to roxadustat, AstraZeneca and Astellas have certain rights to assume manufacturing of roxadustat and the existence of those rights may limit our ability to enter into favorable long-term supply agreements, if at all, with other third-party manufacturers. In addition, our product candidates and any products that we may develop may compete with other product candidates and products for access and prioritization to manufacture. Certain third-party manufacturers may be contractually prohibited from manufacturing our product due to non-compete agreements with our competitors or a commitment to grant another party priority relative to our products. There are a limited number of third-party manufacturers that operate under cGMP and that might be capable of manufacturing to meet our requirements. Due to the limited number of third-party manufacturers with the contractual freedom, expertise, required regulatory approvals and facilities to manufacture our products on a commercial scale, identifying and qualifying a replacement third-party manufacturer would be expensive and time-consuming and may cause delay or interruptions in the production of our product candidates or products, which in turn may delay, prevent or impair our development and commercialization efforts.

We have a letter agreement with IRIX Pharmaceuticals, Inc. ("IRIX"), a third-party manufacturer that we have used in the past, pursuant to which we agreed to negotiate a single source manufacturing agreement that included a right of first negotiation for the cGMP manufacture of HIF-PH inhibitors, including roxadustat, provided that IRIX is able to match any third-party bids within 5%. The exclusive right to manufacture extends for five years after approval of an NDA for those compounds, and any agreement would provide that no minimum amounts would be specified until appropriate by forecast and that we and a commercialization partner would have the rights to contract with independent third parties that exceed IRIX's internal manufacturing capabilities or in the event that we or our commercialization partner determines for reasons of continuity of supply and security that such a need exists, provided that IRIX would supply no less than 65% of the product if it is able to provide this level of supply. Subsequent to the letter agreement, we and IRIX have entered into several additional service agreements. IRIX has requested in writing that we honor the letter agreement with respect to the single source manufacturing agreement, and if we were to enter into any such exclusive manufacturing agreement, there can be no assurance that IRIX will not assert a claim for right to manufacture roxadustat or that IRIX could manufacture roxadustat successfully and in accordance with applicable regulations for a commercial product and the specifications of our collaboration partners. In 2015, Patheon Pharmaceuticals Inc., a business unit of DPx Holdings B.V. ("Patheon"), acquired IRIX, and in 2017 ThermoFisher Scientific Inc. acquired Patheon.

If any third-party manufacturer terminates its engagement with us or fails to perform as agreed, we may be required to find replacement manufacturers, which would result in significant cost and delay to our development programs. Although we believe that there are several potential alternative manufacturers who could manufacture our product candidates, we may incur significant delays and added costs in identifying, qualifying and contracting with any such third party or potential second source manufacturer. In any event, with any third-party manufacturer we expect to enter into technical transfer agreements and share our know-how with the third-party manufacturer, which can be time-consuming and may result in delays. These delays could result in a suspension or delay of marketing roxadustat.

Certain of the components of our product candidates are acquired from single-source suppliers and have been purchased without long-term supply agreements. The loss of any of these suppliers, or their failure to supply us with supplies of sufficient quantity and quality to complete our drug substance or finished drug product of acceptable quality and an acceptable price, would materially and adversely affect our business.

We do not have an alternative supplier of certain components of our product candidates. We may be unable to enter into long-term commercial supply arrangements for some of our products, or do so on commercially reasonable terms, which could have a material adverse impact upon our business. In addition, we currently rely on our contract manufacturers to purchase from third-party suppliers some of the materials necessary to produce our product candidates. We do not have direct control over the acquisition of those materials by our contract manufacturers.

The logistics of our supply chain, which include shipment of materials and intermediates from countries such as China and India add additional time and risk (including risk of loss) to the manufacture of our product candidates. While we have in the past maintained sufficient inventory of materials, API, and drug product to meet our and our collaboration partners' needs for roxadustat to date, the lead time and regulatory approvals required to source from and into countries outside of the U.S. increase the risk of delay and potential shortages of supply.

Risks Related to Our Intellectual Property

If our efforts to protect our proprietary technologies are not adequate, we may not be able to compete effectively in our market.

We rely upon a combination of patents, trade secret protection, and contractual arrangements to protect the intellectual property related to our technologies. We will only be able to protect our products and proprietary information and technology by preventing unauthorized use by third parties to the extent that our patents, trade secrets, and contractual position allow us to do so. Any disclosure to or misappropriation by third parties of our trade secrets or confidential information could compromise our competitive position. Moreover, we are involved in, have in the past been involved in, and may in the future be involved in legal or administrative proceedings involving our intellectual property initiated by third parties, and which proceedings can result in significant costs and commitment of management time and attention. As our product candidates continue in development, third parties may attempt to challenge the validity and enforceability of our patents and proprietary information and technologies.

We also are involved in, have in the past been involved in, and may in the future be involved in initiating legal or administrative proceedings involving the product candidates and intellectual property of our competitors. These proceedings can result in significant costs and commitment of management time and attention, and there can be no assurance that our efforts would be successful in preventing or limiting the ability of our competitors to market competing products.

Composition-of-matter patents relating to the API are generally considered to be the strongest form of intellectual property protection for pharmaceutical products, as such patents provide protection not limited to any one method of use. Method-of-use patents protect the use of a product for the specified method(s), and do not prevent a competitor from making and marketing a product that is identical to our product for an indication that is outside the scope of the patented method. We rely on a combination of these and other types of patents to protect our product candidates, and there can be no assurance that our intellectual property will create and sustain the competitive position of our product candidates.

Biotechnology and pharmaceutical product patents involve highly complex legal and scientific questions and can be uncertain. Any patent applications that we own or license may fail to result in issued patents. Even if patents do successfully issue from our applications, third parties may challenge their validity or enforceability, which may result in such patents being narrowed, invalidated, or held unenforceable. Even if our patents and patent applications are not challenged by third parties, those patents and patent applications may not prevent others from designing around our claims and may not otherwise adequately protect our product candidates. If the breadth or strength of protection provided by the patents and patent applications we hold with respect to our product candidates is threatened, competitors with significantly greater resources could threaten our ability to commercialize our product candidates. Discoveries are generally published in the scientific literature well after their actual development, and patent applications in the U.S. and other countries are typically not published until 18 months after their filing, and in some cases are never published. Therefore, we cannot be certain that we or our licensors were the first to make the inventions claimed in our owned and licensed patents or patent applications, or that we or our licensors were the first to file for patent protection covering such inventions. Subject to meeting other requirements for patentability, for U.S. patent applications filed prior to March 16, 2013, the first to invent the claimed invention is entitled to receive patent protection for that invention while, outside the U.S., the first to file a patent application encompassing the invention is entitled to patent protection for the invention. The U.S. moved to a "first to file" system under the Leahy-Smith America Invents Act, effective March 16, 2013. This system also includes procedures for challenging issued patents and pending patent applications, which creates additional uncertainty. We may become involved in opposition or interference proceedings challenging our patents and patent applications or the patents and patent applications of others, and the outcome of any such proceedings are highly uncertain. An unfavorable outcome in any such proceedings could reduce the scope of or invalidate our patent rights, allow third parties to commercialize our technology and compete directly with us, or result in our inability to manufacture, develop or commercialize our product candidates without infringing the patent rights of others.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 307 of 1730

In addition to the protection afforded by patents, we seek to rely on trade secret protection and confidentiality agreements to protect proprietary know-how, information, or technology that is not covered by our patents. Although our agreements require all of our employees to assign their inventions to us, and we require all of our employees, consultants, advisors and any third parties who have access to our trade secrets, proprietary know-how and other confidential information and technology to enter into appropriate confidentiality agreements, we cannot be certain that our trade secrets, proprietary know-how and other confidential information and technology will not be subject to unauthorized disclosure or that our competitors will not otherwise gain access to or independently develop substantially equivalent trade secrets, proprietary know-how and other information and technology. Furthermore, the laws of some foreign countries, in particular, China, where we have operations, do not protect proprietary rights to the same extent or in the same manner as the laws of the U.S. As a result, we may encounter significant problems in protecting and defending our intellectual property globally. If we are unable to prevent unauthorized disclosure of our intellectual property related to our product candidates and technology to third parties, we may not be able to establish or maintain a competitive advantage in our market, which could materially adversely affect our business and operations.

Intellectual property disputes with third parties and competitors may be costly and time consuming, and may negatively affect our competitive position.

Our commercial success may depend on our avoiding infringement of the patents and other proprietary rights of third parties as well as on enforcing our patents and other proprietary rights against third parties. Pharmaceutical and biotechnology intellectual property disputes are characterized by complex, lengthy and expensive litigation over patents and other intellectual property rights. We may initiate or become party to or be threatened with future litigation or other proceedings regarding intellectual property rights with respect to our product candidates and competing products.

As our product candidates progress toward commercialization, we or our collaboration partners may be subject to patent infringement claims from third parties. We attempt to ensure that our product candidates do not infringe third-party patents and other proprietary rights. However, the patent landscape in competitive product areas is highly complex, and there may be patents of third parties of which we are unaware that may result in claims of infringement. Accordingly, there can be no assurance that our product candidates do not infringe proprietary rights of third parties, and parties making claims against us may seek and obtain injunctive or other equitable relief, which could potentially block further efforts to develop and commercialize our product candidates including roxadustat or pamrevlumab. Any litigation involving defense against claims of infringement, regardless of the merit of such claims, would involve substantial litigation expense and would be a substantial diversion of management time.

We may consider administrative proceedings and other means for challenging third-party patents and patent applications. An unfavorable outcome in any such challenge could require us to cease using the related technology and to attempt to license rights to it from the prevailing third party, which may not be available on commercially reasonable terms, if at all, in which case our business could be harmed.

We intend, if necessary, to vigorously enforce our intellectual property in order to protect the proprietary position of our product candidates, including roxadustat and pamrevlumab. In addition, our collaboration partners who have been granted licenses to our patents may also have rights related to enforcement of those patents. Active efforts to enforce our patents by us or by our partners may include litigation, administrative proceedings, or both, depending on the potential benefits that might be available from those actions and the costs associated with undertaking those efforts against third parties. We carefully review and monitor publicly available information regarding products that may be competitive with our product candidates and assert our intellectual property rights where appropriate. For example, we previously prevailed in an administrative challenge initiated by a major biopharmaceutical company regarding our intellectual property rights, maintaining our intellectual property in all relevant scope, and will continue to protect and enforce our intellectual property rights. In addition, our partner Astellas initiated *quia timet* infringement actions against Akebia and GSK based on our specific patents in the United Kingdom in response to actions taken by Akebia and GSK against those patents, as further detailed below.

Third parties may also challenge our patents and patent applications, through interference, reexamination, inter partes review, and post-grant review proceedings before the U.S. Patent and Trademark Office ("USPTO") or through comparable proceedings in other territories. For example, Akebia and others have filed oppositions against certain European patents within our HIF anemia-related technologies patent portfolio. In three of these proceedings, for FibroGen European Patent Nos. 1463823, 1633333, and 2322155, the European Patent Office has handed down decisions unfavorable to FibroGen. In a fourth of these proceedings, the European Patent Office issued a decision favorable to FibroGen, maintaining FibroGen European Patent No. 2322153 in amended form. All of these decisions are currently under appeal, and these four patents are valid and enforceable pending resolution of the appeals. The ultimate outcomes of such proceedings remain uncertain, and ultimate resolution of the appeals may take considerable time. In addition, Akebia has filed oppositions against FibroGen European Patent Nos. 2289531 and 2298301. As mentioned above, Akebia and GSK initiated invalidation actions in the United Kingdom against the United Kingdom counterparts of each of these European patents, and GSK has filed for a declaration of non-infringement of certain United Kingdom patents (corresponding to FibroGen European Patent Nos. 2322153 and 2322155) with respect to its daprodustat product. We have reached a settlement agreement with GSK to resolve the actions to which GSK is/was a party, resulting in dismissal of the UK court actions as well as the proceedings filed by GSK against the patents in the EPO. Astellas' proceedings brought against GSK on a quia timet basis have also been dismissed as a result of the settlement agreement. Akebia is also pursuing invalidation actions against corresponding patents in Canada and in Japan. While we believe the ultimate outcome of all proceedings will be that these FibroGen patents will be upheld in relevant part, we note that narrowing or even revocation of any of these patents would not affect our exclusivity for roxadustat or our freedom-to-operate with respect to use of roxadustat for the treatment of anemia.

Oppositions have also recently been filed against our European Patent No. 2872488, which claims a crystalline form of roxadustat. Final resolution of the opposition proceedings will take considerable time, and we cannot be assured of the breadth of the claims that will remain in the '488 Patent or that the patent will not be revoked in its entirety.

Furthermore, there is a risk that any public announcements concerning the status or outcomes of intellectual property litigation or administrative proceedings may adversely affect the price of our stock. If securities analysts or our investors interpret such status or outcomes as negative or otherwise creating uncertainty, our common stock price may be adversely affected.

Our reliance on third parties and agreements with collaboration partners requires us to share our trade secrets, which increases the possibility that a competitor may discover them or that our trade secrets will be misappropriated or disclosed.

Our reliance on third-party contractors to develop and manufacture our product candidates is based upon agreements that limit the rights of the third parties to use or disclose our confidential information, including our trade secrets and know-how. Despite the contractual provisions, the need to share trade secrets and other confidential information increases the risk that such trade secrets and information are disclosed or used, even if unintentionally, in violation of these agreements. In the highly competitive markets in which our product candidates are expected to compete, protecting our trade secrets, including our strategies for addressing competing products, is imperative, and any unauthorized use or disclosure could impair our competitive position and may have a material adverse effect on our business and operations.

In addition, our collaboration partners are larger, more complex organizations than ours, and the risk of inadvertent disclosure of our proprietary information may be increased despite their internal procedures and contractual obligations in place with our collaboration partners. Despite our efforts to protect our trade secrets and other confidential information, a competitor's discovery of such trade secrets and information could impair our competitive position and have an adverse impact on our business.

We have an extensive worldwide patent portfolio. The cost of maintaining our patent protection is high and maintaining our patent protection requires continuous review and compliance in order to maintain worldwide patent protection. We may not be able to effectively maintain our intellectual property position throughout the major markets of the world.

The USPTO and foreign patent authorities require maintenance fees and payments as well as continued compliance with a number of procedural and documentary requirements. Noncompliance may result in abandonment or lapse of the subject patent or patent application, resulting in partial or complete loss of patent rights in the relevant jurisdiction. Non-compliance may result in reduced royalty payments for lack of patent coverage in a particular jurisdiction from our collaboration partners or may result in competition, either of which could have a material adverse effect on our business.

We have made, and will continue to make, certain strategic decisions in balancing costs and the potential protection afforded by the patent laws of certain countries. As a result, we may not be able to prevent third parties from practicing our inventions in all countries throughout the world, or from selling or importing products made using our inventions in and into the U.S. or other countries. Third parties may use our technologies in territories in which we have not obtained patent protection to develop their own products and, further, may infringe our patents in territories which provide inadequate enforcement mechanisms, even if we have patent protection. Such third-party products may compete with our product candidates, and our patents or other intellectual property rights may not be effective or sufficient to prevent them from competing.

The laws of some foreign countries do not protect proprietary rights to the same extent as do the laws of the U.S., and we may encounter significant problems in securing and defending our intellectual property rights outside the U.S.

Many companies have encountered significant problems in protecting and defending intellectual property rights in certain countries. The legal systems of certain countries, particularly certain developing countries such as China, do not always favor the enforcement of patents, trade secrets, and other intellectual property rights, particularly those relating to pharmaceutical and biotechnology products, which could make it difficult for us to stop infringement of our patents, misappropriation of our trade secrets, or marketing of competing products in violation of our proprietary rights. In China, our intended establishment of significant operations will depend in substantial part on our ability to effectively enforce our intellectual property rights in that country. Proceedings to enforce our intellectual property rights in foreign countries could result in substantial costs and divert our efforts and attention from other aspects of our business, and could put our patents in these territories at risk of being invalidated or interpreted narrowly, or our patent applications at risk of not being granted, and could provoke third parties to assert claims against us. We may not prevail in all legal or other proceedings that we may initiate and, if we were to prevail, the damages or other remedies awarded, if any, may not be commercially meaningful. Accordingly, our efforts to enforce our intellectual property rights around the world may be inadequate to obtain a significant commercial advantage from the intellectual property that we develop or license.

Intellectual property rights do not address all potential threats to any competitive advantage we may have.

The degree of future protection afforded by our intellectual property rights is uncertain because intellectual property rights have limitations, and intellectual property rights may not adequately protect our business or permit us to maintain our competitive advantage. The following examples are illustrative:

- Others may be able to make compounds that are the same as or similar to our current or future product candidates but that are not covered by the claims of the patents that we own or have exclusively licensed.
- We or any of our licensors or strategic partners might not have been the first to make the inventions covered by the issued patent or pending patent application that we own or have exclusively licensed.
- We or any of our licensors or strategic partners might not have been the first to file patent applications covering certain of our inventions.
- Others may independently develop similar or alternative technologies or duplicate any of our technologies without infringing our intellectual property rights.
- The prosecution of our pending patent applications may not result in granted patents.
- Granted patents that we own or have exclusively licensed may not provide us with any competitive advantages, or may be held invalid
 or unenforceable, as a result of legal challenges by our competitors.
- Patent protection on our product candidates may expire before we are able to develop and commercialize the product, or before we are able to recover our investment in the product.
- Our competitors might conduct research and development activities in the U.S. and other countries that provide a safe harbor from
 patent infringement claims for such activities, as well as in countries in which we do not have patent rights, and may then use the
 information learned from such activities to develop competitive products for sale in markets where we intend to market our product
 candidates.

The existence of counterfeit pharmaceutical products in pharmaceutical markets may compromise our brand and reputation and have a material adverse effect on our business, operations and prospects.

Counterfeit products, including counterfeit pharmaceutical products, are a significant problem, particularly in China. Counterfeit pharmaceuticals are products sold or used for research under the same or similar names, or similar mechanism of action or product class, but which are sold without proper licenses or approvals, and are often lower cost, lower quality, different potency, or have different ingredients or formulations, and have the potential to damage the reputation for quality and effectiveness of the genuine product. Such products may be used for indications or purposes that are not recommended or approved or for which there is no data or inadequate data with regard to safety or efficacy. Such products divert sales from genuine products. If counterfeit pharmaceuticals illegally sold or used for research result in adverse events or side effects to consumers, we may be associated with any negative publicity resulting from such incidents. Consumers may buy counterfeit pharmaceuticals that are in direct competition with our pharmaceuticals, which could have an adverse impact on our revenues, business and results of operations. In addition, the use of counterfeit products could be used in non-clinical or clinical studies, or could otherwise produce undesirable side effects or adverse events that may be attributed to our products as well, which could cause us or regulatory authorities to interrupt, delay or halt clinical trials and could result in the delay or denial of regulatory approval by the FDA or other regulatory authorities and potential product liability claims. With respect to China, although the government has recently been increasingly active in policing counterfeit pharmaceuticals, there is not yet an effective counterfeit pharmaceutical regulation control and enforcement system in China. As a result, we may not be able to prevent third parties from selling or purporting to sell our products in China. The proliferation of counterfeit pharmaceuticals has grown in recent years and may continue to grow in the future. The existence of and any increase in the sales and production of counterfeit pharmaceuticals, or the technological capabilities of counterfeiters, could negatively impact our revenues, brand reputation, business and results of operations.

Risks Related to Government Regulation

The regulatory approval process is highly uncertain and we may not obtain regulatory approval for the commercialization of our product candidates.

The time required to obtain approval by the FDA and comparable foreign regulatory authorities is unpredictable, but typically takes many years following the commencement of preclinical studies and clinical trials and depends upon numerous factors, including the substantial discretion of the regulatory authorities. In addition, approval policies, regulations, or the type and amount of clinical data necessary to gain approval may change during the course of a product candidate's clinical development and may vary among jurisdictions. Except for roxadustat in China for patients on dialysis and not on dialysis, and Japan for patients on dialysis, we have not obtained regulatory approval for any product candidate, and it is possible that neither roxadustat nor pamrevlumab, nor any future product candidates we may discover, in-license or acquire and seek to develop in the future, will obtain regulatory approval in additional countries.

Our product candidates could fail to receive regulatory approval from the FDA or other regulatory authorities for many reasons, including:

- disagreement over the design or implementation of our clinical trials;
- failure to demonstrate that a product candidate is safe and effective for its proposed indication;
- failure of clinical trials to meet the level of statistical significance required for approval;
- failure to demonstrate that a product candidate's clinical and other benefits outweigh its safety risks;
- disagreement over our interpretation of data from preclinical studies or clinical trials;
- disagreement over whether to accept efficacy results from clinical trial sites outside the U.S. where the standard of care is potentially different from that in the U.S.;
- the insufficiency of data collected from clinical trials of our present or future product candidates to support the submission and filing of an NDA or other submission or to obtain regulatory approval;
- disapproval of the manufacturing processes or facilities of either our manufacturing plant or third party manufacturers with whom we contract for clinical and commercial supplies; or
- changes in the approval policies or regulations that render our preclinical and clinical data insufficient for approval.

The FDA or other regulatory authorities may require more information, including additional preclinical or clinical data to support approval, or different analyses, which may delay or prevent approval and our commercialization plans, or we may decide to abandon the development program altogether. Even if we do obtain regulatory approval, our product candidates may be approved for fewer or more limited indications than we request, approval may be contingent on the performance of costly post-marketing clinical trials, or approval may require labeling that does not include the labeling claims necessary or desirable for the successful commercialization of that product candidate. In addition, if our product candidates produce undesirable side effects or safety issues, the FDA may require the establishment of REMS or other regulatory authorities may require the establishment of a similar strategy, that may restrict distribution of our approved products, if any, and impose burdensome implementation requirements on us. Any of the foregoing scenarios could materially harm the commercial prospects for our product candidates.

Even if we believe our clinical trials are successful, regulatory authorities may not agree that our completed clinical trials provide adequate data on safety or efficacy. Approval by one regulatory authority does not ensure approval by any other regulatory authority. However, a failure or delay in obtaining regulatory approval in one country may have a negative effect on the regulatory process in others. We may not be able to file for regulatory approvals and even if we file we may not receive the necessary approvals to commercialize our product candidates in any market.

Our relationships with customers, physicians, and third-party payors are subject, directly or indirectly, to federal and state healthcare fraud and abuse laws, false claims laws, health information privacy and security laws, and other healthcare laws and regulations. If we are unable to comply, or have not fully complied, with such laws, we could face substantial penalties.

If we obtain approval in the U.S. for any of our product candidates, the regulatory requirements applicable to our operations, in particular our sales and marketing efforts, will increase significantly with respect to our operations and the potential for civil and criminal enforcement by the federal government and the states and foreign governments will increase with respect to the conduct of our business. The laws that may affect our operations in the U.S. include:

- the federal Anti-Kickback Statute, which prohibits, among other things, persons from knowingly and willfully soliciting, receiving,
 offering or paying remuneration, directly or indirectly, to induce, or in return for, the purchase or recommendation of an item or service
 reimbursable under a federal healthcare program, such as the Medicare and Medicaid programs;
- federal civil and criminal false claims laws and civil monetary penalty laws, which prohibit, among other things, individuals or entities from knowingly presenting, or causing to be presented, claims for payment from Medicare, Medicaid, or other third-party payors that are false or fraudulent;
- the Health Insurance Portability and Accountability Act of 1996 ("HIPAA"), which created new federal criminal statutes that prohibit executing a scheme to defraud any healthcare benefit program and making false statements relating to healthcare matters;
- HIPAA, as amended by Health Information Technology and Clinical Health Act, and its implementing regulations, which imposes
 certain requirements relating to the privacy, security, and transmission of individually identifiable health information;
- the federal physician sunshine requirements under the Patient Protection and Affordable Care Act ("PPACA"), which requires manufacturers of drugs, devices, biologics, and medical supplies to report annually to the Centers for Medicare and Medicaid Services ("CMS"), information related to payments and other transfers of value to physicians, other healthcare providers, and teaching hospitals, and ownership and investment interests held by physicians and other healthcare providers and their immediate family members;

- foreign and state law equivalents of each of the above federal laws, such as the U.S. Foreign Corrupt Practices Act ("FCPA"), anti-kickback and false claims laws that may apply to items or services reimbursed by any third-party payor, including commercial insurers; state laws that require pharmaceutical companies to comply with the pharmaceutical industry's voluntary compliance guidelines and the applicable compliance guidance promulgated by the federal government, or otherwise restrict payments that may be made to healthcare providers and other potential referral sources; state laws that require drug manufacturers to report information related to payments and other transfers of value to physicians and other healthcare providers or marketing expenditures; and state laws governing the privacy and security of health information in certain circumstances, many of which differ from each other in significant ways, thus complicating compliance efforts; and
- the Trade Agreements Act ("TAA"), which requires that drugs sold to the U.S. Government must be manufactured in the U.S. or in TAA approved and designated countries. Drugs manufactured in countries not approved under the TAA, may not be sold to the U.S. without specific regulatory approval. We have little experience with this regulation and there is a risk that drugs made from Chinesemade API may not be sold to an entity of the U.S. such as the Veterans Health Administration ("VA") due to our inability to obtain regulatory approval. While there have been recent VA policy changes that appear to allow for sale of drugs from non-TAA approved countries, this policy may change or there may be additional policies or legislation that affect our ability to sell drug to the U.S. Government

The scope of these laws and our lack of experience in establishing the compliance programs necessary to comply with this complex and evolving regulatory environment increases the risks that we may unknowingly violate the applicable laws and regulations. If our operations are found to be in violation of any of such laws or any other governmental regulations that apply to us, we may be subject to penalties, including civil and criminal penalties, damages, fines, the curtailment or restructuring of our operations, the exclusion from participation in federal and state healthcare programs and imprisonment, any of which could materially adversely affect our ability to operate our business and our financial results.

Even if resolved in our favor, litigation or other legal proceedings relating to healthcare laws and regulations may cause us to incur significant expenses and could distract our technical and management personnel from their normal responsibilities. In addition, there could be public announcements of the results of hearings, motions or other interim proceedings or developments. If securities analysts or investors perceive these results to be negative, it could have a substantial adverse effect on the price of our common shares. Such litigation or proceedings could substantially increase our operating losses and reduce the resources available for development, manufacturing, sales, marketing or distribution activities. Uncertainties resulting from the initiation and continuation of litigation or other proceedings relating to applicable healthcare laws and regulations could have a material adverse effect on our ability to compete in the marketplace.

We are subject to laws and regulations governing corruption, which will require us to develop, maintain, and implement costly compliance programs.

We must comply with a wide range of laws and regulations to prevent corruption, bribery, and other unethical business practices, including the FCPA, anti-bribery and anti-corruption laws in other countries, particularly China. The implementation and maintenance of compliance programs is costly and such programs may be difficult to enforce, particularly where reliance on third parties is required.

Anti-bribery laws prohibit us, our employees, and some of our agents or representatives from offering or providing any personal benefit to covered government officials to influence their performance of their duties or induce them to serve interests other than the missions of the public organizations in which they serve. Certain commercial bribery rules also prohibit offering or providing any personal benefit to employees and representatives of commercial companies to influence their performance of their duties or induce them to serve interests other than their employers. The FCPA also obligates companies whose securities are listed in the U.S. to comply with certain accounting provisions requiring us to maintain books and records that accurately and fairly reflect all transactions of the corporation, including international subsidiaries, and devise and maintain an adequate system of internal accounting controls for international operations. The anti-bribery provisions of the FCPA are enforced primarily by the Department of Justice. The SEC is involved with enforcement of the books and records provisions of the FCPA.

Compliance with these anti-bribery laws is expensive and difficult, particularly in countries in which corruption is a recognized problem. In addition, the anti-bribery laws present particular challenges in the pharmaceutical industry because in many countries including China, hospitals are state-owned or operated by the government, and doctors and other hospital employees are considered foreign government officials. Furthermore, in certain countries (China in particular), hospitals and clinics are permitted to sell pharmaceuticals to their patients and are primary or significant distributors of pharmaceuticals. Certain payments to hospitals in connection with clinical studies, procurement of pharmaceuticals and other work have been deemed to be improper payments to government officials that have led to vigorous anti-bribery law enforcement actions and heavy fines in multiple jurisdictions, particularly in the U.S. and China.

It is not always possible to identify and deter violations, and the precautions we take to detect and prevent this activity may not be effective in controlling unknown or unmanaged risks or losses or in protecting us from governmental investigations or other actions or lawsuits stemming from a failure to be in compliance with such laws or regulations.

In the pharmaceutical industry, corrupt practices include, among others, acceptance of kickbacks, bribes or other illegal gains or benefits by the hospitals and medical practitioners from pharmaceutical manufacturers, distributors or their third-party agents in connection with the prescription of certain pharmaceuticals. If our employees, affiliates, distributors or third-party marketing firms violate these laws or otherwise engage in illegal practices with respect to their sales or marketing of our products or other activities involving our products, we could be required to pay damages or heavy fines by multiple jurisdictions where we operate, which could materially and adversely affect our financial condition and results of operations. The Chinese government has also sponsored anti-corruption campaigns from time to time, which could have a chilling effect on any future marketing efforts by us to new hospital customers. There have been recent occurrences in which certain hospitals have denied access to sales representatives from pharmaceutical companies because the hospitals wanted to avoid the perception of corruption. If this attitude becomes widespread among our potential customers, our ability to promote our products to hospitals may be adversely affected.

As we expand our operations in China and other jurisdictions internationally, we will need to increase the scope of our compliance programs to address the risks relating to the potential for violations of the FCPA and other anti-bribery and anti-corruption laws. Our compliance programs will need to include policies addressing not only the FCPA, but also the provisions of a variety of anti-bribery and anti-corruption laws in multiple foreign jurisdictions, including China, provisions relating to books and records that apply to us as a public company, and include effective training for our personnel throughout our organization. The creation and implementation of anti-corruption compliance programs is costly and such programs are difficult to enforce, particularly where reliance on third parties is required. Violation of the FCPA and other anti-corruption laws can result in significant administrative and criminal penalties for us and our employees, including substantial fines, suspension or debarment from government contracting, prison sentences, or even the death penalty in extremely serious cases in certain countries. The SEC also may suspend or bar us from trading securities on U.S. exchanges for violation of the FCPA's accounting provisions. Even if we are not ultimately punished by government authorities, the costs of investigation and review, distraction of our personnel, legal defense costs, and harm to our reputation could be substantial and could limit our profitability or our ability to develop or commercialize our product candidates. In addition, if any of our competitors are not subject to the FCPA, they may engage in practices that will lead to their receipt of preferential treatment from foreign hospitals and enable them to secure business from foreign hospitals in ways that are unavailable to us.

The impact of recent U.S. healthcare reform, its potential partial or full repeal, and other changes in the healthcare industry and in healthcare spending is currently unknown, and may adversely affect our business model.

The commercial potential for our approved products could be affected by changes in healthcare spending and policy in the U.S. and abroad. We operate in a highly regulated industry and new laws, regulations or judicial decisions, or new interpretations of existing laws, regulations or decisions, related to healthcare availability, the method of delivery or payment for healthcare products and services could negatively impact our business, operations and financial condition.

In the U.S., the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 ("MMA") altered Medicare coverage and payments for pharmaceutical products. The legislation expanded Medicare coverage for drug purchases by the elderly and introduced a new reimbursement methodology based on average sales prices for physician-administered drugs. The MMA also provided authority for limiting the number of drugs that will be covered in any therapeutic class and as a result, we expect that there will be additional pressure to reduce costs. For example, the CMS in implementing the MMA has enacted regulations that reduced capitated payments to dialysis providers. These cost reduction initiatives and other provisions of the MMA could decrease the scope of coverage and the price that may be received for any approved dialysis products and could seriously harm our business and financial condition. While the MMA applies only to drug benefits for Medicare beneficiaries, private payors often follow Medicare coverage policies and payment limitations in setting their own reimbursement rates, and any reduction in reimbursement that results from the MMA may cause a similar reduction in payments from private payors. Similar regulations or reimbursement policies have been enacted in many international markets which could similarly impact the commercial potential for our products.

Under the Medicare Improvements for Patients and Providers Act ("MIPPA"), a basic case-mix adjusted composite, or bundled, payment system commenced in January 2011 and transitioned fully by January 2014 to a single reimbursement rate for drugs and all services furnished by renal dialysis centers for Medicare beneficiaries with end-stage renal disease. Specifically, under MIPPA the bundle now covers drugs, services, lab tests and supplies under a single treatment base rate for reimbursement by the CMS based on the average cost per treatment, including the cost of ESAs and IV iron doses, typically without adjustment for usage. It is unknown whether roxadustat, if approved in the U.S., will be included in the payment bundle. Under MIPPA, agents that have no IV equivalent in the bundle are currently expected to be excluded from the bundle until 2025. If roxadustat were included in the bundle, it may reduce the price that could be charged for roxadustat, and therefore potentially limit our profitability. Based on roxadustat's differentiated mechanism of action and therapeutic effects, and discussions with our collaboration partner, we currently believe that roxadustat might not be included in the bundle. If roxadustat is reimbursed outside of the bundle, it may potentially limit or delay market penetration of roxadustat.

In March 2010, the Patient Protection and Affordable Care Act of 2010, as amended by the Health Care and Education Reconciliation Act of 2010, (collectively, the "PPACA"), was passed, which substantially changed the way healthcare is financed by both governmental and private payors in the U.S. There remain judicial and Congressional challenges to certain aspects of the PPACA as well as efforts by the Trump administration to repeal or replace certain aspects of the PPACA. For example, the Tax Cuts and Jobs Act of 2017, (the "Tax Act"), was enacted, which includes a provision that repealed, effective January 1, 2019, the tax-based shared responsibility payment imposed by the PPACA on certain individuals who fail to maintain qualifying health coverage for all or part of a year that is commonly referred to as the "individual mandate." In addition, the 2020 federal spending package permanently eliminates, effective January 1, 2020, the PPACA-mandated "Cadillac" tax on high-cost employer-sponsored health coverage and medical device tax and, effective January 1, 2021, also eliminates the health insurer tax. Additionally, on December 15, 2018, a Texas U.S. District Court Judge ruled that the PPACA is unconstitutional in its entirety because the "individual mandate" was repealed by Congress as part of the Tax Act. Additionally, on December 18, 2019, the U.S. Court of Appeals for the 5th Circuit upheld the District Court ruling that the individual mandate was unconstitutional and remanded the case back to the District Court to determine whether the remaining provisions of the PPACA are invalid as well. It is unclear how this decision, future decisions, subsequent appeals, and other efforts to repeal and replace the PPACA will impact the PPACA and our business.

Further, in the U.S. there has been heightened governmental scrutiny over the manner in which manufacturers set prices for their marketed products, which has resulted in several Congressional inquiries and proposed and enacted federal and state legislation designed to, among other things, bring more transparency to drug pricing, reduce the cost of prescription drugs under government payor programs, and review the relationship between pricing and manufacturer patient programs. At the federal level, the Trump administration's budget proposals for fiscal year 2020 contains further drug price control measures that could be enacted during the budget process or in other future legislation. In addition, the Trump administration released a "Blueprint" to lower drug prices and reduce out of pocket costs of drugs that contains additional proposals to increase manufacturer competition, increase the negotiating power of certain federal healthcare programs, incentivize manufacturers to lower the list price of their products, and reduce the out of pocket costs of drug products paid by consumers. The Department of Health and Human Services has solicited feedback on some of these measures and has implemented others under its existing authority. While some of these measures may require additional authorization to become effective, the U.S. Congress and the Trump administration have indicated that they will continue to seek new legislative and/or administrative measures to control drug costs. At the state level, legislatures have increasingly passed legislation and implemented regulations designed to control pharmaceutical and biological product pricing, including price or patient reimbursement constraints, discounts, restrictions on certain product access and marketing cost disclosure and transparency measures, and, in some cases, designed to encourage importation from other countries and bulk purchasing. We expect that additional U.S. healthcare reform measures will be adopted in the future, any of which could limit the amounts that the U.S. federal government will pay for healthcare products and services, which could result in reduced demand for any future products or additional pricing pressures.

Roxadustat is considered a Class 2 substance on the 2019 World Anti-Doping Agency Prohibited List which could limit sales and increase security and distribution costs for us and our partners, particularly in China.

Roxadustat is considered a Class 2 substance on the World Anti-Doping Agency ("WADA") Prohibited List. There are enhanced security and distribution procedures we and our collaboration partners and third-party contractors will have to take to limit the risk of loss of product in the supply chain. As a result, our distribution, manufacturing and sales costs for roxadustat, as well as for our partners, will be increased which will reduce profitability. In addition, there is a risk of reduced sales due to patient access to this drug. This is particularly the case in China where we will not be able to sell roxadustat in private pharmacies due to the WADA classification. While private pharmacies only represent approximately 10% of the market in China, this will negatively affect sales and therefore the profitability of roxadustat and the Company as a whole.

Our employees may engage in misconduct or other improper activities, including noncompliance with regulatory standards and requirements, which could result in significant liability for us and harm our reputation.

We are exposed to the risk of employee fraud or other misconduct, including intentional failure to:

- · comply with FDA regulations or similar regulations of comparable foreign regulatory authorities;
- provide accurate information to the FDA or comparable foreign regulatory authorities;
- comply with manufacturing standards we have established;
- comply with privacy laws protecting personal information;
- comply with federal and state healthcare fraud and abuse laws and regulations and similar laws and regulations established and enforced by comparable foreign regulatory authorities;
- comply with the FCPA and other anti-bribery laws;
- report financial information or data accurately;
- or disclose unauthorized activities to us.

Employee misconduct could also involve the improper use of information obtained in the course of clinical trials, which could result in regulatory sanctions, delays in clinical trials, or serious harm to our reputation. We have adopted a code of conduct for our directors, officers and employees, but it is not always possible to identify and deter employee misconduct. The precautions we take to detect and prevent this activity may not be effective in controlling unknown or unmanaged risks or losses or in protecting us from governmental investigations or other actions or lawsuits stemming from a failure to be in compliance with such laws or regulations. If any such actions are instituted against us, and we are not successful in defending ourselves or asserting our rights, those actions could harm our business, results of operations, financial condition and cash flows, including through the imposition of significant fines or other sanctions.

If we fail to comply with environmental, health and safety laws and regulations, we could become subject to fines or penalties or incur costs that could harm our business.

We are subject to numerous environmental, health and safety laws and regulations, including those governing laboratory procedures and the handling, use, storage, treatment and disposal of hazardous materials and wastes. Our operations involve the use of hazardous and flammable materials, including chemicals and biological materials. Our operations also produce hazardous waste products. We contract with third parties for the disposal of these materials and wastes. We cannot eliminate the risk of contamination or injury from these materials. In the event of contamination or injury resulting from our use of hazardous materials, we could be held liable for any resulting damages, and any liability could exceed our resources. We also could incur significant costs associated with civil or criminal fines and penalties for failure to comply with such laws and regulations. We do not maintain insurance for environmental liability or toxic tort claims that may be asserted against us in connection with our storage or disposal of biological, hazardous or radioactive materials.

In addition, we may incur substantial costs in order to comply with current or future environmental, health and safety laws and regulations applicable to our operations in the U.S. and foreign countries. These current or future laws and regulations may impair our research, development or manufacturing efforts. Our failure to comply with these laws and regulations also may result in substantial fines, penalties or other sanctions.

Risks Related to Our International Operations

We are establishing international operations and seeking approval to commercialize our product candidates outside of the U.S., in particular in China, and a number of risks associated with international operations could materially and adversely affect our business.

We expect to be subject to a number of risks related with our international operations, many of which may be beyond our control. These risks include:

- different regulatory requirements for drug approvals in different countries;
- different standards of care in various countries that could complicate the evaluation of our product candidates;
- different U.S. and foreign drug import and export rules;
- reduced protection for intellectual property rights in certain countries;

- changes in tariffs, trade barriers and regulatory requirements;
- different reimbursement systems and different competitive drugs indicated to treat the indications for which our product candidates are being developed;
- economic weakness, including inflation, or political instability in particular foreign economies and markets;
- · compliance with tax, employment, immigration and labor laws for employees living or traveling abroad;
- · compliance with the FCPA, and other anti-corruption and anti-bribery laws;
- U.S. and foreign taxes, including withholding of payroll taxes;
- foreign currency fluctuations, which could result in increased operating costs and expenses and reduced revenues, and other
 obligations incident to doing business in another country;
- workforce uncertainty in countries where labor unrest is more common than in the U.S.;
- · production shortages resulting from any events affecting raw material supply or manufacturing capabilities abroad;
- a reliance on CROs, clinical trial sites, principal investigators and other third parties that may be less experienced with clinical trials or have different methods of performing such clinical trials than we are used to in the U.S.;
- · potential liability resulting from development work conducted by foreign distributors; and
- business interruptions resulting from geopolitical actions, including war and terrorism, or natural disasters.

The pharmaceutical industry in China is highly regulated and such regulations are subject to change.

The pharmaceutical industry in China is subject to comprehensive government regulation and supervision, encompassing the approval, registration, manufacturing, packaging, licensing and marketing of new drugs. Refer to "Business - Government Regulation - Regulation in China" for a discussion of the regulatory requirements that are applicable to our current and planned business activities in China. In recent years, the regulatory framework in China regarding the pharmaceutical industry has undergone significant changes, and we expect that it will continue to undergo significant changes. For example, the Chinese government has implemented regulations that impact distribution of pharmaceutical products in China. These regulations generally require that at most two invoices may be issued throughout the distribution chain. Failure to comply with the "Two-Invoices" regulations would prevent us from accessing the market in China. As a result of the "Two-Invoices" regulation, we, rather than AstraZeneca, have been directly engaging distributors and a third-party logistics provider, and we are planning on modifying the distribution responsibilities under the China Agreement such that both companies will work together to manage the distribution network. FibroGen China Anemia Holdings, Ltd ("FibroGen China") has never managed distribution of pharmaceutical products, and this new distribution structure may impose higher costs or limit or delay our ability to sell products to our principal customers, and may limit the near term sales of our products. Any other such changes or amendments may result in increased compliance costs on our business or cause delays in or prevent the successful development or commercialization of our product candidates in China. Any failure by us or our partners to maintain compliance with applicable laws and regulations or obtain and maintain required licenses and permits may result in the suspension or termination of our business activities in China.

We plan to use our own manufacturing facilities in China to produce roxadustat API and roxadustat drug product. As an organization, we have limited experience in the construction, licensure, and operation of a manufacturing plant, and accordingly we cannot assure you we will be able to meet regulatory requirements to operate our plant and to sell our products.

We have two manufacturing facilities in China, with one located in Beijing and the other in Cangzhou, Hebei. However, as an organization, we have limited experience licensing and operating commercial manufacturing facilities.

We will be obligated to comply with continuing cGMP requirements and there can be no assurance that we will maintain all of the appropriate licenses required to manufacture our product candidates for clinical and commercial use in China. In addition, we and our product suppliers must continually spend time, money and effort in production, record-keeping and quality assurance and appropriate controls in order to ensure that any products manufactured in our facilities meet applicable specifications and other requirements for product safety, efficacy and quality and there can be no assurance that our efforts will continue to be successful in meeting these requirements.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 317 of 1730

Manufacturing facilities in China are subject to periodic unannounced inspections by the NMPA and other regulatory authorities. We expect to depend on these facilities for our product candidates and business operations in China. Natural disasters or other unanticipated catastrophic events, including power interruptions, water shortages, storms, fires, pandemics, earthquakes, terrorist attacks, government appropriation of our facilities, and wars, could significantly impair our ability to operate our manufacturing facilities. Certain equipment, records and other materials located in these facilities would be difficult to replace or would require substantial replacement lead time that would impact our ability to successfully commercialize our product candidates in China. The occurrence of any such event could materially and adversely affect our business, financial condition, results of operations, cash flows and prospects.

In addition to manufacturing, we are responsible for pharmacovigilance, medical affairs, and management of the third-party distribution logistics for roxadustat in China. We have no experience in these areas as a company, and accordingly we cannot assure you we will be able to meet regulatory requirements or operate in these capacities successfully.

We are responsible for commercial manufacturing, pharmacovigilance, medical affairs, and management of the third-party distribution logistics for roxadustat commercial activities in China. While we have been increasing our staffing in these areas, as a company, we have no experience managing or operating these functions for a commercial product and there can be no guarantee that we will do so efficiently or effectively. Mistakes or delays in these areas could limit our ability to successfully commercialize roxadustat in China, could limit our eventual market penetration, sales and profitability, and could subject us to significant liability in China.

Our business could be adversely affected by the effects of health epidemics in regions where we have significant manufacturing facilities, concentrations of customers, or other business operations. We have significant operations in China and depend on China manufacturing operations for various stages of our worldwide supply chain for roxadustat. We do not yet know the full extent of the impact on our roxadustat global supply chain or China operations from the disease caused by the 2019 novel coronavirus ("COVID-19"). In addition, if COVID-19 becomes a worldwide pandemic, it could materially affect our operations globally, including at our headquarters in San Francisco, California, and our clinical trials that are taking place predominantly in the U.S., Europe and China.

Our business could be adversely affected by health epidemics in regions where we have significant manufacturing facilities, concentrations of customers, or other business operations.

We have taken measures to minimize the health risks of COVID-19 as the safety and well-being of our staff is our top priority. While we have resumed manufacturing operations in China, we currently expect many of our employees to continue transitioning from working from home to returning to our offices following the closure of our offices in Beijing, Shanghai, and Canghzou in February 2020. Our collaboration partner AstraZeneca is also in the process of resuming operations. In addition, many governments, including the Chinese government, have taken measures to restrict travel to reduce the spread of COVID-19, which may limit our operational capabilities.

Due to these and potentially additional business disruptions, there may be delays to our roxadustat supply chain, problems with our distribution or warehousing vendors, or delays to our (and our partners') commercialization and launch activities in China (including efforts to list roxadustat in hospitals), all of which could have a material impact on our revenue.

If the COVID-19 outbreak continues to spread, particularly outside of China, we may need to limit operations again in China or implement limitations, including work from home policies, in the U.S. There is a risk that other countries or regions may be less effective at containing COVID-19, or it may be more difficult to contain if the outbreak reaches a larger population or broader geography, in which case the risks described herein could be elevated significantly.

In particular, while we and our Chinese manufacturing partner WuXi STA have resumed manufacturing operations, we only have a limited stockpile of roxadustat API and Drug Product, and therefore, if there is a greater impact from the COVID-19 outbreak than currently expected, or if operations are halted again, we could face shortages in our China and global supply chains.

In addition, current and upcoming clinical trials run in China by us and our partner AstraZeneca may be affected by the COVID-19 outbreak. Site initiation and patient enrollment may be delayed due to prioritization of hospital resources toward the COVID-19 outbreak, but the extent of these potential delays is unknown at this time. If COVID-19 becomes a worldwide pandemic, it may delay enrollment in our global clinical trials, including here in the U.S., and some patients may not be able to comply with clinical trial protocols if quarantines impede patient movement or interrupt healthcare services, which would delay our clinical results and ultimate commercialization of our product candidates affected.

The COVID-19 outbreak has already impacted China's economy and the global economy, and China's healthcare system as a whole has been disrupted since the beginning of 2020. It is unknown how long this disruption will continue and how it will affect the government healthcare budget and pharmaceutical sales as patient visits to hospitals and physician engagement and medical affairs efforts have been greatly affected due to the outbreak. The effect on the government budget in China could lead to increased pressure on drug prices which could affect future reimbursement or our ability to obtain hospital listings for roxadustat.

For roxadustat specifically, while the effect on our sales may be more limited than for more established drugs as we have only recently been added to the National Reimbursement Drug List and are still in the process of securing hospital listings, we do expect some delay in our launch-progress, including with respect to increasing sales and obtaining more hospital listings.

The ultimate impact of the COVID-19 outbreak is highly uncertain and subject to change. We do not yet know the full extent of potential delays or impacts on our business, healthcare systems, or the global economy as a whole. However, these effects could have a material impact on our operations and revenue and we will continue to monitor the COVID-19 situation closely.

We and our collaboration partner in China, AstraZeneca, may experience difficulties in successfully generating sales of roxadustat in China.

We and AstraZeneca have a profit sharing arrangement with respect to roxadustat in China and any difficulties we may experience in generating sales will affect our bottom line. Difficulties may be related to our ability to maintain reasonable pricing and reimbursement, obtain hospital listing, or other difficulties related to distribution, marketing, and sales efforts in China. For example, our current National Reimbursement Drug List reimbursement pricing is effective for a standard two-year period (between January 1, 2020 to December 31, 2021), after which time we will have to renegotiate a new price for roxadustat, which may be lower. Sales of roxadustat in China may be limited due to the complex nature of the healthcare system, low average personal income, pricing controls, still developing infrastructure and potentially rapid competition from other products. The hospital listing process is critical to roxadustat's near-term commercial success in China and may take many years to obtain the majority of hospital listings.

The retail prices of any product candidates that we develop may be subject to control, including periodic downward adjustment, by Chinese government authorities.

The price for pharmaceutical products is highly regulated in China, both at the national and provincial level. Price controls may reduce prices to levels significantly below those that would prevail in less regulated markets or limit the volume of products that may be sold, either of which may have a material and adverse effect on potential revenues from sales of roxadustat in China. Moreover, the process and timing for the implementation of price restrictions is unpredictable, which may cause potential revenues from the sales of roxadustat to fluctuate from period to period.

If our planned business activities in China fall within a restricted category under the China Catalog for Guidance for Foreign Investment, we will need to operate in China through a variable interest entity ("VIE") structure.

The China Catalog for Guidance for Foreign Investment sets forth the industries and sectors that the Chinese government encourages and restricts with respect to foreign investment and participation. The Catalog for Guidance for Foreign Investment is subject to revision from time to time by the China Ministry of Commerce. While we currently do not believe the development and marketing of roxadustat falls within a restricted category under the Catalog for Guidance for Foreign Investment, if roxadustat does fall under such a restricted category, we will need to operate in China through a VIE structure. A VIE structure involves a wholly foreign-owned enterprise that would control and receive the economic benefits of a domestic Chinese company through various contractual relationships. Such a structure would subject us to a number of risks that may have an adverse effect on our business, including that the Chinese government may determine that such contractual arrangements do not comply with applicable regulations, Chinese tax authorities may require us to pay additional taxes, shareholders of our VIEs may have potential conflicts of interest with us, and we may lose the ability to use and enjoy assets held by our VIEs that are important to the operations of our business if such entities go bankrupt or become subject to dissolution or liquidation proceedings. VIE structures in China have come under increasing scrutiny from accounting firms and the Securities and Exchange Commission ("SEC") staff. If we do attempt to use a VIE structure and are unsuccessful in structuring it so as to qualify as a VIE, we would not be able to consolidate the financial statements of the VIE with our financial statements, which could have a material adverse effect on our operating results and financial condition.

FibroGen (China) Medical Technology Development Co., Ltd. ("FibroGen Beijing") would be subject to restrictions on paying dividends or making other payments to us, which may restrict our ability to satisfy our liquidity requirements.

We plan to conduct all of our business in China through FibroGen China and FibroGen Beijing. We may rely on dividends and royalties paid by FibroGen Beijing for a portion of our cash needs, including the funds necessary to service any debt we may incur and to pay our operating costs and expenses. The payment of dividends by FibroGen Beijing is subject to limitations. Regulations in China currently permit payment of dividends only out of accumulated profits as determined in accordance with accounting standards and regulations in China. FibroGen Beijing is not permitted to distribute any profits until losses from prior fiscal years have been recouped and in any event must maintain certain minimum capital requirements. FibroGen Beijing is also required to set aside at least 10.0% of its after-tax profit based on Chinese accounting standards each year to its statutory reserve fund until the cumulative amount of such reserves reaches 50.0% of its registered capital. Statutory reserves are not distributable as cash dividends. In addition, if FibroGen Beijing incurs debt on its own behalf in the future, the agreements governing such debt may restrict its ability to pay dividends or make other distributions to us. As of December 31, 2019, approximately \$7.0 million of our cash and cash equivalents is held in China.

Any capital contributions from us to FibroGen Beijing must be approved by the Ministry of Commerce in China, and failure to obtain such approval may materially and adversely affect the liquidity position of FibroGen Beijing.

The Ministry of Commerce in China or its local counterpart must approve the amount and use of any capital contributions from us to FibroGen Beijing, and there can be no assurance that we will be able to complete the necessary government registrations and obtain the necessary government approvals on a timely basis, or at all. If we fail to do so, we may not be able to contribute additional capital to fund our Chinese operations, and the liquidity and financial position of FibroGen Beijing may be materially and adversely affected.

We may be subject to currency exchange rate fluctuations and currency exchange restrictions with respect to our operations in China, which could adversely affect our financial performance.

Most of our product sales will occur in local Chinese currency and our operating results will be subject to volatility from currency exchange rate fluctuations. To date, we have not hedged against the risks associated with fluctuations in exchange rates and, therefore, exchange rate fluctuations could have an adverse impact on our future operating results. Changes in value of the Renminbi against the U.S. dollar, Euro and other currencies is affected by, among other things, changes in China's political and economic conditions. Currently, the Renminbi is permitted to fluctuate within a narrow and managed band against a basket of certain foreign currencies. Any significant currency exchange rate fluctuations may have a material adverse effect on our business and financial condition.

In addition, the Chinese government imposes controls on the convertibility of the Renminbi into foreign currencies and the remittance of foreign currency out of China for certain transactions. Shortages in the availability of foreign currency may restrict the ability of FibroGen Beijing to remit sufficient foreign currency to pay dividends or other payments to us, or otherwise satisfy their foreign currency-denominated obligations. Under existing Chinese foreign exchange regulations, payments of current account items, including profit distributions, interest payments and balance of trade, can be made in foreign currencies without prior approval from the State Administration of Foreign Exchange ("SAFE") by complying with certain procedural requirements. However, approval from SAFE or its local branch is required where Renminbi is to be converted into foreign currency and remitted out of China to pay capital expenses such as the repayment of loans denominated in foreign currencies. The Chinese government may also at its discretion restrict access in the future to foreign currencies for current account transactions. If the foreign exchange control system prevents us from obtaining sufficient foreign currency to satisfy our operational requirements, our liquidity and financial position may be materially and adversely affected.

Because FibroGen Beijing's funds are held in banks that do not provide insurance, the failure of any bank in which FibroGen Beijing deposits its funds could adversely affect our business.

Banks and other financial institutions in China do not provide insurance for funds held on deposit. As a result, in the event of a bank failure, FibroGen Beijing may not have access to funds on deposit. Depending upon the amount of money FibroGen Beijing maintains in a bank that fails, its inability to have access to cash could materially impair its operations.

We may be subject to tax inefficiencies associated with our offshore corporate structure.

The tax regulations of the U.S. and other jurisdictions in which we operate are extremely complex and subject to change. New laws, new interpretations of existing laws, such as the Base Erosion Profit Shifting project initiated by the Organization for Economic Co-operation and Development, and any legislation proposed by the relevant taxing authorities, or limitations on our ability to structure our operations and intercompany transactions may lead to inefficient tax treatment of our revenue, profits, royalties, and distributions, if any are achieved.

In addition, we and our foreign subsidiaries have various intercompany transactions. We may not be able to obtain certain benefits under relevant tax treaties to avoid double taxation on certain transactions among our subsidiaries. If we are not able to avail ourselves to the tax treaties, we could be subject to additional taxes, which could adversely affect our financial condition and results of operations.

On December 22, 2017, the U.S. enacted the Tax Act that instituted fundamental changes to the taxation of multinational corporations. The Tax Act includes changes to the taxation of foreign earnings by implementing a dividend exemption system, expansion of the current anti-deferral rules, a minimum tax on low-taxed foreign earnings and new measures to deter base erosion. There have been developing interpretations of the provisions of the Tax Act, including changes and issuance of new U.S. Treasury regulations, administrative interpretations, or court decisions since its inception. As regulations and guidance evolve with respect to the Tax Act, we continue to examine the impact to our business, which could have a material adverse effect on our business, results of operations or financial condition.

Our foreign operations, particularly those in China, are subject to significant risks involving the protection of intellectual property.

We seek to protect the products and technology that we consider important to our business by pursuing patent applications in China and other countries, relying on trade secrets or pharmaceutical regulatory protection or employing a combination of these methods. We note that the filing of a patent application does not mean that we will be granted a patent, or that any patent eventually granted will be as broad as requested in the patent application or will be sufficient to protect our technology. There are a number of factors that could cause our patents, if granted, to become invalid or unenforceable or that could cause our patent applications not to be granted, including known or unknown prior art, deficiencies in the patent application, or lack of originality of the technology. Furthermore, the terms of our patents are limited. The patents we hold and the patents that may be granted from our currently pending patent applications have, absent any patent term adjustment or extension, a twenty-year protection period starting from the date of application.

Intellectual property rights and confidentiality protections in China may not be as effective as those in the U.S. or other countries for many reasons, including lack of procedural rules for discovery and evidence, low damage awards, and lack of judicial independence. Implementation and enforcement of China intellectual property laws have historically been deficient and ineffective and may be hampered by corruption and local protectionism. Policing unauthorized use of proprietary technology is difficult and expensive, and we may need to resort to litigation to enforce or defend patents issued to us or to determine the enforceability and validity of our proprietary rights or those of others. The experience and capabilities of China courts in handling intellectual property litigation varies and outcomes are unpredictable. An adverse determination in any such litigation could materially impair our intellectual property rights and may harm our business.

Uncertainties with respect to the China legal system could have a material adverse effect on us.

The legal system of China is a civil law system primarily based on written statutes. Unlike in a common law system, prior court decisions may be cited for reference but are not binding. Because the China legal system continues to rapidly evolve, the interpretations of many laws, regulations and rules are not always uniform and enforcement of these laws, regulations and rules involve uncertainties, which may limit legal protections available to us. Moreover, decision makers in the China judicial system have significant discretion in interpreting and implementing statutory and contractual terms, which may render it difficult for FibroGen Beijing to enforce the contracts it has entered into with our business partners, customers and suppliers. Different government departments may have different interpretations of certain laws and regulations, and licenses and permits issued or granted by one government authority may be revoked by a higher government authority at a later time. Navigating the uncertainty and change in the China legal system will require the devotion of significant resources and time, and there can be no assurance that our contractual and other rights will ultimately be enforced.

Changes in China's economic, political or social conditions or government policies could have a material adverse effect on our business and operations.

Chinese society and the Chinese economy continue to undergo significant change. Changes in the regulatory structure, regulations, and economic policies of the Chinese government could have a material adverse effect on the overall economic growth of China, which could adversely affect our ability to conduct business in China. The Chinese government continues to adjust economic policies to promote economic growth. Some of these measures benefit the overall Chinese economy, but may also have a negative effect on us. For example, our financial condition and results of operations in China may be adversely affected by government control over capital investments or changes in tax regulations. As the Chinese pharmaceutical industry grows and evolves, the Chinese government may also implement measures to change the regulatory structure and structure of foreign investment in this industry. We are unable to predict the frequency and scope of such policy changes and structural changes, any of which could materially and adversely affect FibroGen Beijing's development and commercialization timelines, liquidity, access to capital, and its ability to conduct business in China. Any failure on our part to comply with changing government regulations and policies could result in the loss of our ability to develop and commercialize our product candidates in China. In addition, the changing government regulations and policies could result in delays and cost increases to our development, manufacturing, approval, and commercialization timelines in China.

Our operations in China subject us to various Chinese labor and social insurance laws, and our failure to comply with such laws may materially and adversely affect our business, financial condition and results of operations.

We are subject to China Labor Contract Law, which provides strong protections for employees and imposes many obligations on employers. The Labor Contract Law places certain restrictions on the circumstances under which employers may terminate labor contracts and require economic compensation to employees upon termination of employment, among other things. In addition, companies operating in China are generally required to contribute to labor union funds and the mandatory social insurance and housing funds. Any failure by us to comply with Chinese labor and social insurance laws may subject us to late fees, fines and penalties, or cause the suspension or termination of our ability to conduct business in China, any of which could have a material and adverse effect on business, results of operations and prospects.

Developments relating to the United Kingdom's referendum vote in favor of leaving the European Union could adversely affect us.

Effective January 31, 2020, the United Kingdom commenced an exit from the European Union, commonly referred to as "Brexit." During a transition period (set to expire on December 31, 2020), the British government will continue to negotiate the terms of the United Kingdom's future relationship with the European Union. The outcome of these negotiations is uncertain, and we do not know to what extent Brexit will ultimately impact the business and regulatory environment in the United Kingdom, the rest of Europe, or other countries. The effects of the United Kingdom's withdrawal from the European Union, and the perceptions as to its impact, are expected to be far-reaching and may adversely affect business activity and economic conditions in Europe and globally and could continue to contribute to instability in global financial markets, including foreign exchange markets. The United Kingdom's withdrawal from the European Union could also have the effect of disrupting the free movement of goods, services and people between the United Kingdom and Europe and could also lead to legal uncertainty and potentially divergent national laws and regulations as the United Kingdom determines which European laws to replace or replicate, including laws that could impact our ability, or our collaborator's ability in the case of roxadustat, to obtain approval of our products or sell our products in the United Kingdom. Changes impacting our ability to conduct business in the United Kingdom or other European countries, or changes to the regulatory regime applicable to our operations in those countries (such as with respect to the approval of our product candidates), may materially and adversely impact our business, prospects, operating results, and financial condition.

Risks Related to the Operation of Our Business

We may encounter difficulties in managing our growth and expanding our operations successfully.

As we seek to advance our product candidates through clinical trials and commercialization, we will need to expand our development, regulatory, manufacturing, commercialization and administration capabilities or contract with third parties to provide these capabilities for us. As our operations expand and we continue to undertake the efforts and expense to operate as a public reporting company, we expect that we will need to increase the responsibilities on members of management in order to manage any future growth effectively. Our failure to accomplish any of these steps could prevent us from successfully implementing our strategy and maintaining the confidence of investors in us.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 322 of 1730

Loss of senior management and key personnel, including the recent passing of our founder, chairman and chief executive officer, could adversely affect our ability to successfully develop our product candidates, conduct our clinical trials and commercialize our product candidates.

We are highly dependent on members of our senior management team. In August 2019, Thomas B. Neff, our founder, chairman and chief executive officer, passed away, and subsequently James Schoeneck, a longtime member of our Board of Directors, was appointed as interim chief executive officer. On January 6, 2020, we announced the appointment of Enrique Conterno as chief executive officer, with Mr. Schoeneck stepping down from the interim role. The loss of Mr. Neff and his knowledge of the Company's programs may be disruptive to our operations and could negatively impact the development and commercialization of our product candidates, our existing collaborative relationships, and our ability to successfully implement our business strategy, as could changes in our executive team in the future.

Recruiting and retaining qualified commercial, development, scientific, clinical, and manufacturing personnel are and will continue to be critical to our success, particularly as we expand our commercialization operations. Furthermore, replacing executive officers and key employees may be difficult and may take an extended period of time because of the limited number of individuals in our industry with the breadth of skills and experience required to successfully develop, gain regulatory approval of and commercialize product candidates. We may be unable to hire, train, retain or motivate these key personnel on acceptable terms given the intense competition among numerous biopharmaceutical companies for similar personnel.

There is also significant competition, in particular in the San Francisco Bay Area, for the hiring of experienced and qualified personnel, which increases the importance of retention of our existing personnel. If we are unable to continue to attract and retain personnel with the quality and experience applicable to our product candidates, our ability to pursue our strategy will be limited and our business and operations would be adversely affected.

If product liability lawsuits are brought against us, we may incur substantial liabilities and may be required to limit commercialization of our product candidates.

We face an inherent risk of product liability as a result of the clinical testing, manufacturing and commercialization of our product candidates. Any such product liability claims may include allegations of defects in manufacturing, defects in design, a failure to warn of dangers inherent in a product, negligence, strict liability or breach of warranty. Claims could also be asserted under state consumer protection acts. If we are unable to obtain insurance coverage at levels that are appropriate to maintain our business and operations, or if we are unable to successfully defend ourselves against product liability claims, we may incur substantial liabilities or otherwise cease operations. Product liability claims may result in:

- termination of further development of unapproved product candidates or significantly reduced demand for any approved products;
- material costs and expenses to defend the related litigation;
- a diversion of time and resources across the entire organization, including our executive management;
- product recalls, withdrawals or labeling restrictions;
- termination of our collaboration relationships or disputes with our collaboration partners; and
- reputational damage negatively impacting our other product candidates in development.

If we fail to obtain and retain sufficient product liability insurance at an acceptable cost to protect against potential product liability claims, we may not be able to continue to develop our product candidates. We maintain product liability insurance in a customary amount for the stage of development of our product candidates. Although we believe that we have sufficient coverage based on the advice of our third-party advisors, there can be no assurance that such levels will be sufficient for our needs. Moreover, our insurance policies have various exclusions, and we may be in a dispute with our carrier as to the extent and nature of our coverage, including whether we are covered under the applicable product liability policy. If we are not able to ensure coverage or are required to pay substantial amounts to settle or otherwise contest the claims for product liability, our business and operations would be negatively affected.

Our business and operations would suffer in the event of computer system failures.

Despite the implementation of security measures, our internal computer systems, and those of our CROs, collaboration partners, and other third parties on which we rely, are vulnerable to damage from computer viruses, unauthorized access, natural disasters, fire, terrorism, war and telecommunication and electrical failures. We upgraded our disaster and data recovery capabilities in 2017, however, to the extent that any disruption or security breach, in particular with our partners' operations, results in a loss of, or damage to, our data or applications, or inappropriate disclosure of confidential or proprietary information, we could incur liability and it could result in a material disruption and delay of our drug development programs. For example, the loss of clinical trial data from completed, ongoing or planned clinical trials could result in delays in our regulatory approval efforts and significantly increase our costs to recover or reproduce the data.

We depend on sophisticated information technology systems to operate our business and a cyber-attack or other breach of these systems could have a material adverse effect on our business.

We rely on information technology systems to process, transmit and store electronic information in our day-to-day operations. The size and complexity of our information technology systems makes them vulnerable to a cyber-attack, malicious intrusion, breakdown, destruction, loss of data privacy or other significant disruption. While we have recently upgraded our disaster data recovery program, a successful attack could result in the theft or destruction of intellectual property, data, or other misappropriation of assets, or otherwise compromise our confidential or proprietary information and disrupt our operations. Cyber-attacks are becoming more sophisticated and frequent. We have invested in our systems and the protection and recoverability of our data to reduce the risk of an intrusion or interruption, and we monitor and test our systems on an ongoing basis for any current or potential threats. There can be no assurance that these measures and efforts will prevent future interruptions or breakdowns. If we fail to maintain or protect our information technology systems and data integrity effectively or fail to anticipate, plan for or manage significant disruptions to these systems, we could have difficulty preventing, detecting and controlling such cyber-attacks and any such attacks could result in losses described above as well as disputes with physicians, patients and our partners, regulatory sanctions or penalties, increases in operating costs and expenses, expenses or lost revenues or other adverse consequences, any of which could have a material adverse effect on our business, results of operations, financial condition, prospects and cash flows.

Our headquarters are located near known earthquake fault zones. The occurrence of an earthquake, fire or any other catastrophic event could disrupt our operations or the operations of third parties who provide vital support functions to us, which could have a material adverse effect on our business, results of operations and financial condition.

We and some of the third-party service providers on which we depend for various support functions are vulnerable to damage from catastrophic events, such as power loss, natural disasters, terrorism and similar unforeseen events beyond our control. Our corporate headquarters and other facilities are located in the San Francisco Bay Area, which in the past has experienced severe earthquakes and fires.

We do not carry earthquake insurance. Earthquakes or other natural disasters could severely disrupt our operations, and have a material adverse effect on our business, results of operations, financial condition and prospects.

If a natural disaster, power outage or other event occurred that prevented us from using all or a significant portion of our headquarters, damaged critical infrastructure, or otherwise disrupted operations, it may be difficult or, in certain cases, impossible for us to continue our business for a substantial period of time. The disaster recovery and business continuity plans we have in place are unlikely to provide adequate protection in the event of a serious disaster or similar event. We may incur substantial expenses as a result of the limited nature of our disaster recovery and business continuity plans, which, particularly when taken together with our lack of earthquake insurance, could have a material adverse effect on our business.

Furthermore, integral parties in our supply chain are operating from single sites, increasing their vulnerability to natural disasters or other sudden, unforeseen and severe adverse events. If such an event were to affect our supply chain, it could have a material adverse effect on our business.

Risks Related to Our Common Stock

The market price of our common stock may be highly volatile, and you may not be able to resell your shares at or above your purchase price.

In general, pharmaceutical, biotechnology and other life sciences company stocks have been highly volatile in the current market. The volatility of pharmaceutical, biotechnology and other life sciences company stocks is sometimes unrelated to the operating performance of particular companies and biotechnology and life science companies stocks often respond to trends and perceptions rather than financial performance. In particular, the market price of shares of our common stock could be subject to wide fluctuations in response to the following factors:

- results of clinical trials of our product candidates, including roxadustat and pamrevlumab;
- the timing of the release of results of and regulatory updates regarding our clinical trials;
- the level of expenses related to any of our product candidates or clinical development programs;
- results of clinical trials of our competitors' products;
- safety issues with respect to our product candidates or our competitors' products;
- regulatory actions with respect to our product candidates and any approved products or our competitors' products;
- fluctuations in our financial condition and operating results, which will be significantly affected by the manner in which we recognize revenue from the achievement of milestones under our collaboration agreements;
- adverse developments concerning our collaborations and our manufacturers;
- the termination of a collaboration or the inability to establish additional collaborations;
- the inability to obtain adequate product supply for any approved drug product or inability to do so at acceptable prices;
- disputes or other developments relating to proprietary rights, including patents, litigation matters and our ability to obtain patent protection for our technologies;
- changes in legislation or other regulatory developments affecting our product candidates or our industry;
- fluctuations in the valuation of the biotechnology industry and particular companies perceived by investors to be comparable to us;
- speculation in the press or investment community;
- announcements of investigations or regulatory scrutiny of our operations or lawsuits filed against us;
- activities of the government of China, including those related to the pharmaceutical industry as well as industrial policy generally;
- performance of other U.S. publicly traded companies with significant operations in China;
- changes in market conditions for biopharmaceutical stocks; and
- the other factors described in this "Risk Factors" section.

As a result of fluctuations caused by these and other factors, comparisons of our operating results across different periods may not be accurate indicators of our future performance. Any fluctuations that we report in the future may differ from the expectations of market analysts and investors, which could cause the price of our common stock to fluctuate significantly. Moreover, securities class action litigation has often been initiated against companies following periods of volatility in their stock price. This type of litigation could result in substantial costs and divert our management's attention and resources and could also require us to make substantial payments to satisfy judgments or to settle litigation.

If securities or industry analysts do not continue to publish research or reports about our business, or if they change their recommendations regarding our stock adversely, our stock price and trading volume could decline.

The trading market for our common stock will be influenced by the research and reports that industry or securities analysts publish about us or our business. If one or more of the analysts who cover us downgrade our stock, our stock price would likely decline. If one or more of these analysts cease coverage of us or fail to regularly publish reports on us, we could lose visibility in the financial markets, which in turn could cause our stock price or trading volume to decline.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 325 of 1730

Our principal stockholders and management own a significant percentage of our stock and will be able to exercise significant influence over matters subject to stockholder approval.

As of January 31, 2020, our executive officers, directors and principal stockholders, together with their respective affiliates, owned approximately 27.60% of our common stock, including shares subject to outstanding options that are exercisable within 60 days after such date and shares issuable upon settlement of restricted stock units that will vest within 60 days after such date. This percentage is based upon information supplied by officers, directors and principal stockholders and Schedules 13D and 13G, if any, filed with the SEC, which information may not be accurate as of January 31, 2020. Accordingly, these stockholders will be able to exert a significant degree of influence over our management and affairs and over matters requiring stockholder approval, including the election of our board of directors and approval of significant corporate transactions. The interests of this group may differ from those of other stockholders and they may vote their shares in a way that is contrary to the way other stockholders vote their shares. This concentration of ownership could have the effect of entrenching our management and/or the board of directors, delaying or preventing a change in our control or otherwise discouraging a potential acquirer from attempting to obtain control of us, which in turn could have a material and adverse effect on the fair market value of our common stock.

We may engage in future acquisitions that could disrupt our business, cause dilution to our stockholders and harm our business, results of operations, financial condition and cash flows and future prospects.

While we currently have no specific plans to acquire any other businesses, we may, in the future, make acquisitions of, or investments in, companies that we believe have products or capabilities that are a strategic or commercial fit with our present or future product candidates and business or otherwise offer opportunities for us. In connection with these acquisitions or investments, we may:

- issue stock that would dilute our existing stockholders' percentage of ownership;
- · incur debt and assume liabilities; and
- incur amortization expenses related to intangible assets or incur large and immediate write-offs.

We may not be able to complete acquisitions on favorable terms, if at all. If we do complete an acquisition, we cannot assure you that it will ultimately strengthen our competitive position or that it will be viewed positively by customers, financial markets or investors. Furthermore, future acquisitions could pose numerous additional risks to our operations, including:

- problems integrating the purchased business, products or technologies, or employees or other assets of the acquisition target;
- increases to our expenses;
- disclosed or undisclosed liabilities of the acquired asset or company;
- diversion of management's attention from their day-to-day responsibilities;
- reprioritization of our development programs and even cessation of development and commercialization of our current product candidates;
- harm to our operating results or financial condition;
- entrance into markets in which we have limited or no prior experience; and
- potential loss of key employees, particularly those of the acquired entity.

We may not be able to complete any acquisitions or effectively integrate the operations, products or personnel gained through any such acquisition.

Provisions in our charter documents and Delaware law may have anti-takeover effects that could discourage an acquisition of us by others, even if an acquisition would be beneficial to our stockholders, and may prevent attempts by our stockholders to replace or remove our current directors or management.

Provisions in our amended and restated certificate of incorporation and amended and restated bylaws contain provisions that may have the effect of discouraging, delaying or preventing a change in control of us or changes in our management. These provisions could also limit the price that investors might be willing to pay in the future for shares of our common stock, thereby depressing the market price of our common stock. In addition, because our board of directors is responsible for appointing the members of our management team, these provisions may frustrate or prevent any attempts by our stockholders to replace or remove our current management by making it more difficult for stockholders to replace members of our board of directors. Among other things, these provisions:

- authorize "blank check" preferred stock, which could be issued by our board of directors without stockholder approval and may contain voting, liquidation, dividend and other rights superior to our common stock;
- create a classified board of directors whose members serve staggered three-year terms;
- specify that special meetings of our stockholders can be called only by our board of directors pursuant to a resolution adopted by a
 majority of the total number of directors;
- prohibit stockholder action by written consent;
- establish an advance notice procedure for stockholder approvals to be brought before an annual meeting of our stockholders, including proposed nominations of persons for election to our board of directors;
- provide that our directors may be removed prior to the end of their term only for cause;
- provide that vacancies on our board of directors may be filled only by a majority of directors then in office, even though less than a
 quorum;
- require a supermajority vote of the holders of our common stock or the majority vote of our board of directors to amend our bylaws;
- require a supermajority vote of the holders of our common stock to amend the classification of our board of directors into three classes and to amend certain other provisions of our certificate of incorporation.

These provisions, alone or together, could delay or prevent hostile takeovers and changes in control or changes in our management by making it more difficult for stockholders to replace members of our board of directors, which is responsible for appointing the members of our management.

Moreover, because we are incorporated in Delaware, we are governed by certain anti-takeover provisions under Delaware law which may discourage, delay or prevent someone from acquiring us or merging with us whether or not it is desired by or beneficial to our stockholders. We are subject to the provisions of Section 203 of the Delaware General Corporation Law, which prohibits a person who owns in excess of 15% of our outstanding voting stock from merging or combining with us for a period of three years after the date of the transaction in which the person acquired in excess of 15% of our outstanding voting stock, unless the merger or combination is approved in a prescribed manner.

Any provision of our amended and restated certificate of incorporation, our amended and restated bylaws or Delaware law that has the effect of delaying or deterring a change in control could limit the opportunity for our stockholders to receive a premium for their shares of our common stock, and could also affect the price that some investors are willing to pay for our common stock.

Changes in our tax provision or exposure to additional tax liabilities could adversely affect our earnings and financial condition.

As a multinational corporation, we are subject to income taxes in the U.S. and various foreign jurisdictions. Significant judgment is required in determining our global provision for income taxes and other tax liabilities. In the ordinary course of a global business, there are intercompany transactions and calculations where the ultimate tax determination is uncertain. Our income tax returns are subject to audits by tax authorities. Although we regularly assess the likelihood of adverse outcomes resulting from these examinations to determine our tax estimates, a final determination of tax audits or tax disputes could have an adverse effect on our results of operations and financial condition.

We are also subject to non-income taxes, such as payroll, sales, use, value-added, net worth, property, gross receipts, and goods and services taxes in the U.S., state and local, and various foreign jurisdictions. We are subject to audit and assessments by tax authorities with respect to these non-income taxes and may have exposure to additional non-income tax liabilities, which could have an adverse effect on our results of operations and financial condition.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 327 of 1730

In addition, our judgment in providing for the possible impact of the Tax Act remains subject to developing interpretations of the provisions of the Tax Act. As regulations and guidance evolve with respect to the Tax Act, we continue to examine the impact to our tax provision or exposure to additional tax liabilities, which could have a material adverse effect on our business, results of operations or financial condition.

Tariffs imposed by the U.S. and those imposed in response by other countries, as well as rapidly changing trade relations, could have a material adverse effect on our business and results of operations.

Changes in U.S. and foreign governments' trade policies have resulted in, and may continue to result in, tariffs on imports into and exports from the U.S. Throughout 2018 and 2019, the U.S. imposed tariffs on imports from several countries, including China. In response, China has proposed and implemented their own tariffs on certain products, which may impact our supply chain and our costs of doing business. If we are impacted by the changing trade relations between the U.S. and China, our business and results of operations may be negatively impacted. Continued diminished trade relations between the U.S. and other countries, including potential reductions in trade with China and others, as well as the continued escalation of tariffs, could have a material adverse effect on our financial performance and results of operations.

Our amended and restated certificate of incorporation designates the state or federal courts located in the State of Delaware as the sole and exclusive forum for certain types of actions and proceedings that may be initiated by our stockholders, which could limit our stockholders' ability to obtain a favorable judicial forum for disputes with us or our directors, officers or employees.

Our amended and restated certificate of incorporation provides that, subject to limited exceptions, the state and federal courts located in the State of Delaware will be the sole and exclusive forum for (1) any derivative action or proceeding brought on our behalf, (2) any action asserting a claim of breach of a fiduciary duty owed by any of our directors, officers or other employees to us or our stockholders, (3) any action asserting a claim against us arising pursuant to any provision of the Delaware General Corporation Law, our amended and restated certificate of incorporation or our amended and restated by-laws, or (4) any other action asserting a claim against us that is governed by the internal affairs doctrine. Any person or entity purchasing or otherwise acquiring any interest in shares of our capital stock shall be deemed to have notice of and to have consented to the provisions of our amended and restated certificate of incorporation described above. This choice of forum provision may limit a stockholder's ability to bring a claim in a judicial forum that it finds favorable for disputes with us or our directors, officers or other employees, which may discourage such lawsuits against us and our directors, officers and employees. Alternatively, if a court were to find these provisions of our amended and restated certificate of incorporation inapplicable to, or unenforceable in respect of, one or more of the specified types of actions or proceedings, we may incur additional costs associated with resolving such matters in other jurisdictions, which could adversely affect our business and financial condition.

Because we do not anticipate paying any cash dividends on our capital stock in the foreseeable future, capital appreciation, if any, will be your sole source of gain and you may never receive a return on your investment.

You should not rely on an investment in our common stock to provide dividend income. We do not anticipate that we will pay any cash dividends to holders of our common stock in the foreseeable future and investors seeking cash dividends should not purchase our common stock. We plan to retain any earnings to invest in our product candidates and maintain and expand our operations. Therefore, capital appreciation, or an increase in your stock price, which may never occur, may be the only way to realize any return on your investment.

ITEM 1B. UNRESOLVED STAFF COMMENTS

None.

ITEM 2. PROPERTIES

Our corporate and research and development operations are located in San Francisco, California, where we lease approximately 234,000 square feet of office and laboratory space with approximately 35,000 square feet subleased. The lease for our San Francisco headquarters expires in 2023. We also lease approximately 67,000 square feet of office and manufacturing space in Beijing, China. Our lease in China expires in 2021. We have constructed a commercial manufacturing facility of approximately 5,500 square meters in Cangzhou, China, on approximately 33,000 square meters of land. Our right to use such land expires in 2068. We believe our facilities are adequate for our current needs and that suitable additional or substitute space would be available if needed.

ITEM 3. LEGAL PROCEEEDINGS

We are not currently a party to any material legal proceedings.

ITEM 4. MINE SAFETY DISCLOSURES

Not applicable.

PART II

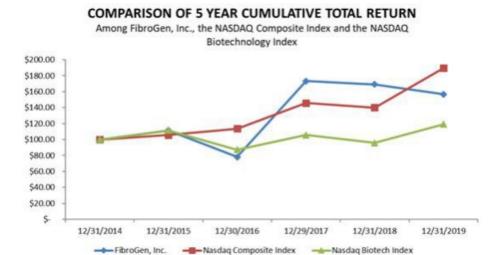

ITEM 5. MARKET FOR REGISTRANT'S COMMON EQUITY, RELATED STOCKHOLDER MATTERS AND ISSUER PURCHASES OF EQUITY **SECURITIES**

Market Information for Common Stock

Our common stock has been listed on the NASDAQ Global Select Market ("NASDAQ") since November 14, 2014, under the symbol "FGEN." Prior to our initial public offering, there was no public market for our common stock.

Stock Price Performance Graph

The following graph illustrates a comparison of the total cumulative stockholder return for our common stock since December 31, 2014 to two indices: the NASDAQ Composite Index and the NASDAQ Biotechnology Index. The graph assumes an initial investment of \$100 on December 31, 2014, in our common stock, the stocks comprising the NASDAQ Composite Index, and the stocks comprising the NASDAQ Biotechnology Index. The stockholder return shown in the graph below is not necessarily indicative of future performance, and we do not make or endorse any predictions as to future stockholder returns.

The above Stock Price Performance Graph and related information shall not be deemed "soliciting material" or to be "filed" with the Securities and Exchange Commission, nor shall such information be incorporated by reference into any future filing under the Securities Act or Exchange Act, except to the extent that we specifically incorporate it by reference into such filing.

-----Nasdag Biotech Index

Dividend Policy

We have never declared or paid any cash dividends on our capital stock. We currently intend to retain all available funds and any future earnings to support our operations and finance the growth and development of our business. We do not intend to pay cash dividends on our common stock for the foreseeable future. Any future determination related to our dividend policy will be made at the discretion of our board of directors and will depend on then-existing conditions, including our financial condition, operating results, contractual restrictions, capital requirements, business prospects and other factors our board of directors may deem relevant.

Stockholders

As of January 31, 2020, there were 136 registered stockholders of record for our common stock. This number of registered stockholders does not include stockholders whose shares are held in street name by brokers and other nominees, or may be held in trust by other entities. Therefore, the actual number of stockholders is greater than this number of registered stockholders of record.

Use of Proceeds from Initial Public Offering of Common Stock

On November 13, 2014, our Registration Statement on Form S-1, as amended (Reg. Nos. 333-199069 and 333-200189) was declared effective in connection with the initial public offering of our common stock. There has been no material change in the planned use of proceeds from our initial public offering as described in our final prospectus filed with the SEC pursuant to Rule 424(b) under the Securities Act on November 14, 2014.

Recent Sales of Unregistered Securities

During the year ended December 31, 2019, a warrant to purchase 4,430 shares of our common stock was exercised at a per share price of \$15.00.

These shares issued pursuant to the warrant were not registered under the Securities Act of 1933, as amended, in reliance upon the exemption set forth in Section 4(a)(2) of such Act for transactions not involving a public offering.

Purchases of Equity Securities by the Issuer and Affiliated Purchasers

None.

ITEM 6. SELECTED FINANCIAL DATA

The selected consolidated results of operations data for the years ended December 31, 2019, 2018 and 2017, and the consolidated balance sheet data as of December 31, 2019 and 2018 should be read together with Part II, Item 7 "Management's Discussion and Analysis of Financial Condition and Results of Operations" and in conjunction with the consolidated financial statements, related notes, and other financial information included elsewhere in this Annual Report. The selected consolidated results of operations data for the year ended December 31, 2016 and 2015 and the consolidated balance sheet data as of December 31, 2017, 2016 and 2015 have been derived from audited financial statements not included herein. Our historical results are not necessarily indicative of the results to be expected in the future.

ITEM 7. MANAGEMENT'S DISCUSSION AND ANALYSIS OF FINANCIAL CONDITION AND RESULTS OF OPERATIONS

You should read the following discussion and analysis of our financial condition and results of operations together with our consolidated financial statements and related notes and other financial information included in Item 15 of this Annual Report on Form 10-K. Some of the information contained in this discussion and analysis or set forth elsewhere in this Annual Report, including information with respect to our plans and strategy for our business, international operations and product candidates, includes forward-looking statements that involve risks and uncertainties. You should review the "Risk Factors" section of this Annual Report for a discussion of important factors that could cause our actual results to differ materially from the results described in or implied by the forward-looking statements contained in the following discussion and analysis.

BUSINESS OVERVIEW

We were incorporated in 1993 in Delaware and are headquartered in San Francisco, California, with subsidiary offices in Beijing and Shanghai, People's Republic of China ("China"). We are a leading biopharmaceutical company developing and commercializing a pipeline of first-in-class therapeutics. We apply our pioneering expertise in hypoxia-inducible factor ("HIF"), connective tissue growth factor ("CTGF") biology, and clinical development to advance innovative medicines for the treatment of anemia, fibrotic disease, and cancer. Roxadustat, our most advanced product, is an oral small molecule inhibitor of HIF prolyl hydroxylase ("HIF-PH") activity that has received marketing authorization in China for the treatment of anemia caused by chronic kidney disease ("CKD") in dialysis and non-dialysis patients. In September 2019, roxadustat (Evrenzo®) was approved in Japan for the treatment of anemia associated with CKD in dialysis-dependent patients. In January 2020, Astellas Pharma Inc. ("Astellas") submitted a supplemental New Drug Application ("NDA") in Japan for the treatment of anemia in non-dialysis CKD patients. Our NDA filing for roxadustat for the treatment of anemia patients with dialysis-dependent CKD and non-dialysis-dependent CKD was accepted for review by the United States ("U.S.") Food and Drug Administration ("FDA") in February 2020, and Astellas is in the process of preparing a Marketing Authorization Application ("MAA") for submission to the European Medicines Agency ("EMA") in the second quarter of 2020 for the same indications. Roxadustat is in Phase 3 clinical development in the U.S. and Europe and in Phase 2/3 development in China for anemia associated with myelodysplastic syndromes ("MDS"). Roxadustat is in Phase 2 clinical development for chemotherapy-induced anemia. Pamrevlumab, an anti-CTGF human monoclonal antibody, is in Phase 3 clinical development for the treatment of both idiopathic pulmonary fibrosis ("IPF") and pancreatic cancer. Pamrevlumab is also currently in a Phase 2 trial for Duch

			December 31, 2019		December 31, 2018				
				(in thousands)					
Balance Sheet									
Cash and cash equivalents			\$	126,266	\$	89,258			
Short-term and long-term investments			\$	468,609	\$	587,964			
Accounts receivable			\$	28,455	\$	63,684			

Our revenue for the year ended December 31, 2019 included the revenues recognized related to the following:

- Two regulatory milestones totaling \$130.0 million associated with the planned MAA submission to the EMA under the collaboration agreement with Astellas for roxadustat as a treatment for dialysis and non-dialysis CKD patients;
- A \$50.0 million regulatory milestone associated with the NDA submission to the FDA under the collaboration agreement with AstraZeneca for roxadustat as a treatment for dialysis and non-dialysis CKD patients;
- Three regulatory milestones totaling \$22.0 million associated with roxadustat being included on the updated National Reimbursement Drug List
 ("NRDL") released by China's National Healthcare Security Administration ("NHSA"); and
- A regulatory milestone of \$12.5 million associated with the NDA approval in Japan.

Meanwhile, our overall revenue for the year ended December 31, 2019 was reduced by \$36.3 million of a change in estimated variable consideration related to the API product revenue that was recognized in 2018 discussed below, which reflected the total difference between estimated and actual listed price and yield from the manufacture of bulk product tablets.

As comparison, our revenue for the year ended December 31, 2018 included the revenues recognized related to the following:

- A \$64.8 million product revenue for API delivered during 2018, under the amendment to the collaboration agreement with Astellas for roxadustat for the treatment of anemia in Japan ("Japan Agreement"), to conduct commercial scale manufacturing validation for roxadustat drug product in anticipation of commercial launch in Japan;
- A regulatory milestone of \$15.0 million associated with an NDA submission during 2018 in Japan;
- A \$6.0 million milestone under the collaboration agreements with AstraZeneca upon our receipt of marketing authorization from the NMPA for
 roxadustat, a first-in-class HIF-PH inhibitor, for the treatment of anemia caused by CKD in patients on dialysis; and
- A \$6.0 million milestone payable under the collaboration agreement with AstraZeneca upon our receipt of First Manufacturing Approval for a
 Product in the Field in the Territory, which allows production for Phase 4 clinical studies, patients' early experience programs, donation
 programs, as well as to supply products for testing and assessments required prior to launch.

Operating expenses increased for the year ended December 31, 2019 compared to the prior year primarily due to the following:

- · Higher outside service expenses related to co-promotional activities and scientific contract expenses;
- · Higher stock-based compensation related to the cumulative impact of stock option grant activities;
- Amortization of finance lease ROU assets and higher depreciation expenses related to the adoption of lease accounting guidance under ASC 842:
- · Higher legal expenses mainly associated with patent-related and international activities; and
- · Higher employee-related expenses resulting from higher average compensation level.

The increases were partially offset by:

- · Lower clinical trial expenses related to lower activities for roxadustat offset by higher activities for pamrevlumab; and
- Lower drug development expenses associated with drug substance manufacturing activities related to pamrevlumab, and capitalization of
 inventory manufacturing costs.

Our research and development expenses were \$209.3 million, \$235.8 million and \$196.5 million for the years ended December 31, 2019, 2018 and 2017, respectively. Since inception and through December 31, 2019, we have incurred a total of approximately \$2 billion in research and development expenses, a majority of which relates to the development of roxadustat, pamrevlumab and other HIF-PH inhibitors. We expect to continue to incur significant expenses and operating losses over at least the next several years and we expect our research and development expenses to increase in the future as we advance our product candidates through clinical trials and expand our product candidate portfolio. In addition, we expect to incur significant expenses relating to seeking regulatory approval for our product candidates and commercializing those products in various markets, including China. We consider the active management and development of our clinical pipeline to be particularly crucial to our long-term success. The process of conducting the necessary clinical research to obtain regulatory approval is costly and time consuming.

The actual probability of success for each of our product candidates and clinical programs, and our ability to generate product revenue and become profitable, depends upon a variety of factors, including the quality of the product candidate, clinical results, investment in the program, competition, manufacturing capability, commercial viability, and our and our partners' ability to successfully execute our development and commercialization plans. For a description of the numerous risks and uncertainties associated with product development, refer to "Risk Factors."

During the year ended December 31, 2019, we had a net loss of \$77.0 million, or net loss per basic and diluted share of \$0.89, as compared to a net loss of \$86.4 million, or net loss per basic and diluted share of \$1.03 for the prior year, primarily due to an increase in revenue, partially offset by an increase in operating expenses.

Cash and cash equivalents, investments and accounts receivable totaled \$623.3 million at December 31, 2019, a decrease of \$117.6 million from December 31, 2018, primarily due to cash used in operations.

Programs

Roxadustat, our most advanced product, is an oral small molecule inhibitor of HIF-PH activity that has received marketing authorization in China for the treatment of anemia caused by CKD in non-dialysis-dependent patients (adding the non-dialysis indication to the label for dialysis-dependent patients, which was approved in December 2018). In September 2019, roxadustat (Evrenzo®) was approved in Japan for the treatment of anemia associated with CKD in dialysis-dependent patients. In January 2020, Astellas submitted a supplemental NDA in Japan for the treatment of anemia in non-dialysis CKD patients. Our U.S. NDA filing for roxadustat for the treatment of anemia patients with dialysis-dependent CKD and non-dialysis-dependent CKD was accepted for review by the FDA in February 2020, and Astellas is in the process of preparing an MAA for submission to the EMA in the second quarter of 2020 for the same indications. Roxadustat is in Phase 3 clinical development in the U.S. and Europe and in Phase 2/3 development in China for anemia associated with MDS. Roxadustat is in Phase 2 clinical development for chemotherapy-induced anemia.

Pamrevlumab, an anti-CTGF human monoclonal antibody, is in Phase 3 clinical development for the treatment of both IPF and pancreatic cancer. Pamrevlumab is also currently in a Phase 2 trial for DMD.

Collaboration Partnerships for Roxadustat

Our current and future research, development, manufacturing and commercialization efforts with respect to roxadustat and our other product candidates currently in development depend on funds from our collaboration agreements with Astellas and AstraZeneca as described below.

Astellas

In June 2005, we entered into a collaboration agreement with Astellas for the development and commercialization (but not manufacture) of roxadustat for the treatment of anemia in Japan ("Japan Agreement"). In April 2006, we entered into the Europe Agreement with Astellas for roxadustat for the treatment of anemia in Europe, the Commonwealth of Independent States, the Middle East, and South Africa. Under these agreements, we provide Astellas the right to develop and commercialize roxadustat for anemia indications in these territories.

We share responsibility with Astellas for clinical development activities required for the U.S. and the Europe regulatory approval of roxadustat and share equally those development costs under the agreed development plan for such activities. Astellas will be responsible for clinical development activities and all associated costs required for regulatory approval in all other countries in the Astellas territories. Astellas will own and have responsibility for regulatory filings in its territories. We are responsible, either directly or through our contract manufacturers, for the manufacture and supply of all quantities of roxadustat to be used in development and commercialization under the agreements.

The Astellas agreements will continue in effect until terminated. Either party may terminate the agreements for certain material breaches by the other party. In addition, Astellas will have the right to terminate the agreements for certain specified technical product failures, upon generic sales reaching a particular threshold, upon certain regulatory actions, or upon our entering into a settlement admitting the invalidity or unenforceability of our licensed patents. Astellas may also terminate the agreements for convenience upon advance written notice to us. In the event of any termination of the agreements, Astellas will transfer and assign to us the regulatory filings for roxadustat and will assign or license to us the relevant trademarks used with the products in the Astellas territories. Under certain terminations, Astellas is also obligated to pay us a termination fee

Consideration under these agreements includes a total of \$360.1 million in upfront and non-contingent payments, and milestone payments totaling \$557.5 million, of which \$542.5 million are development and regulatory milestones and \$15.0 million are commercial-based milestones. Total consideration, excluding development cost reimbursement and product sales-related payments, could reach \$917.6 million. The aggregate amount of such consideration received, through December 31, 2019 totals \$500.1 million. Additionally, under these agreements, Astellas pays 100% of the commercialization costs in its territories. Astellas will pay FibroGen a transfer price, based on net sales, in the low 20% range for our manufacture and delivery of roxadustat.

In September 2019, Japan's Ministry of Health, Labour and Welfare approved roxadustat for the treatment of anemia associated with dialysis CKD patients. Accordingly, the consideration of \$12.5 million associated with this milestone was included in the transaction price and allocated to performance obligations under the Japan Agreement in the third quarter of 2019. This milestone payment was received in October 2019.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 333 of 1730

During the second quarter of 2019, we received positive topline results from analyses of pooled major adverse cardiac event ("MACE") and MACE+ data from its Phase 3 trials evaluating roxadustat as a treatment for dialysis and non-dialysis CKD patients, enabling Astellas to prepare for an MAA submission to the EMA in the second quarter of 2020, following our NDA submission to the FDA in 2019 and acceptance for review in February 2020. We evaluated the two regulatory milestone payments associated with the planned MAA submission and concluded that these milestones became probable of being achieved in the second quarter of 2019. Accordingly, the total consideration of \$130.0 million associated with these milestones was included in the transaction price and allocated to performance obligations under the Europe Agreement in the second quarter of 2019.

During the second quarter of 2018, Astellas reported positive results from the final Phase 3 CKD-dialysis trial of roxadustat in Japan, indicating that Astellas was ready to make an NDA submission for the treatment of anemia with roxadustat in CKD-dialysis patients in 2018. We evaluated the regulatory milestone payment associated with NDA submission in Japan based on variable consideration requirements under the current revenue standards and concluded that this milestone became probable of being achieved in the second quarter of 2018. Accordingly, the consideration of \$15.0 million associated with this milestone was included in the transaction price and allocated to performance obligations under the Japan Agreement, substantially all of which was recognized as revenue in 2018.

On November 30, 2018, FibroGen and Astellas entered into an amendment to the Japan Agreement that will allow Astellas to manufacture roxadustat drug product for commercialization in Japan (the "Japan Amendment"). Under this amendment, FibroGen would continue to manufacture and deliver to Astellas roxadustat API. The commercial terms of the Japan Agreement relating to the transfer price for roxadustat for commercial use remain substantially the same, reflecting an adjustment for the manufacture of drug product by Astellas rather than FibroGen. This amendment obligated Astellas to purchase a total of \$64.7 million API from FibroGen, all of which was delivered to Astellas in 2018. In 2019, a change in estimated variable consideration resulted in a \$36.3 million reduction to revenue, at the time the listed price for roxadustat was issued by the Japanese Ministry of Health, Labour and Welfare, which reflected the total difference between estimated and actual listed price and yield from the manufacture of bulk product tablets.

In the fourth quarter of 2018, we were engaged in the final stages of review with our partners over the proposed development of roxadustat for the treatment of chemotherapy-induced anemia. AstraZeneca and Astellas approved the program in December 2018 and January 2019, respectively. Costs associated with the development of this indication are shared 50-50 between our two partners. For revenue recognition purposes, we concluded that this new indication represents a modification to the Europe agreements and will be accounted for separately, meaning the development costs associated with the new indications are distinct from the original development costs. The development service period for roxadustat for the treatment of CIA under the Europe Agreement is estimated to continue through the end of 2023 to allow for development of this indication.

In addition, as of December 31, 2019, Astellas had separate investments of \$80.5 million in the equity of FibroGen, Inc.

AstraZeneca

In July 2013, we entered into the U.S./RoW Agreement a collaboration agreement with AstraZeneca for roxadustat for the treatment of anemia in the U.S. and all territories not previously licensed to Astellas, except China. In July 2013, through our China subsidiary and related affiliates, we entered into the China Agreement a collaboration agreement with AstraZeneca for roxadustat for the treatment of anemia in China. Under these agreements we provide AstraZeneca the right to develop and commercialize roxadustat for anemia in these territories. We share responsibility with AstraZeneca for clinical development activities required for U.S. regulatory approval of roxadustat.

In 2015, we reached the \$116.5 million cap on our initial funding obligations (during which time we shared 50% of the joint initial development costs), therefore all development and commercialization costs for roxadustat for the treatment of anemia in CKD in the U.S., Europe, Japan and all other markets outside of China have been paid by Astellas and AstraZeneca since reaching the cap.

In China, FibroGen (China) Medical Technology Development Co., Ltd. ("FibroGen Beijing") will conduct the development work for CKD anemia, will hold all of the regulatory licenses issued by China regulatory authorities, and will be primarily responsible for regulatory, clinical and manufacturing. China development costs are shared 50/50. AstraZeneca is also responsible for 100% of development expenses in all other licensed territories outside of China. We are responsible, through our contract manufacturers, for the manufacture and supply of all quantities of roxadustat to be used in development and commercialization under the AstraZeneca agreements.

Under the AstraZeneca agreements, we will receive upfront and subsequent non-contingent payments totaling \$402.2 million. Potential milestone payments under the agreements total \$1.2 billion, of which \$571.0 million are development and regulatory milestones and \$652.5 million are commercial-based milestones. Total consideration under the agreements, excluding development cost reimbursement, transfer price payments, royalties and profit share, could reach \$1.6 billion. The aggregate amount of such consideration received through December 31, 2019 totals \$444.2 million.

Under the U.S./RoW Agreement, AstraZeneca will pay for all commercialization costs in the U.S. and RoW and AstraZeneca will be responsible for the U.S. commercialization of roxadustat, with FibroGen undertaking specified promotional activities in the end stage renal disease segment in the U.S. In addition, we will receive a transfer price for delivery of commercial product based on a percentage of net sales in the low- to mid-single digit range and AstraZeneca will pay us a tiered royalty on net sales of roxadustat in the low 20% range.

Under the China Agreement, which is conducted through FibroGen China Anemia Holdings, Ltd. ("FibroGen China"), the commercial collaboration is structured as a 50/50 profit share. AstraZeneca will conduct sales and marketing activities in China and fund roxadustat launch costs in China until FibroGen Beijing has achieved profitability. At that time, AstraZeneca will recoup 50% of their historical launch costs out of initial roxadustat profits in China. As of December 31, 2019, we accrued \$53.1 million of co-promotional expenses related to the estimated amount payable to AstraZeneca for such sales and marketing efforts. The payment for such amount is not expected to occur within the next year.

Payments under these agreements include over \$500.0 million in upfront, non-contingent and other payments received or expected to be received prior to the first U.S. approval, excluding development expense reimbursement.

AstraZeneca may terminate the U.S./RoW Agreement upon specified events, including our bankruptcy or insolvency, our uncured material breach, technical product failure, or upon 180 days prior written notice at will. If AstraZeneca terminates the U.S./RoW Agreement at will, in addition to any unpaid non-contingent payments, it will be responsible for paying for a substantial portion of the post-termination development costs under the agreed development plan until regulatory approval.

AstraZeneca may terminate the China Agreement upon specified events, including our bankruptcy or insolvency, our uncured material breach, technical product failure, or upon advance prior written notice at will. If AstraZeneca terminates our China Agreement at will, it will be responsible for paying for transition costs as well as make a specified payment to FibroGen China.

In the event of any termination of the agreements, but subject to modification upon termination for technical product failure, AstraZeneca will transfer and assign to us any regulatory filings and approvals for roxadustat in the affected territories that they may hold under our agreements, grant us licenses and conduct certain transition activities.

In December 2019, roxadustat has been included on the updated NRDL released by China's NHSA for the treatment of anemia in CKD, covering patients who are non-dialysis-dependent as well as those who are dialysis-dependent. The inclusion on the NRDL triggered a total of \$22.0 million milestones payable to us by AstraZeneca. Accordingly, the total consideration of \$22.0 million associated with these milestones was included in the transaction price and allocated to performance obligations under the U.S./ RoW Agreement in the fourth quarter of 2019.

As mentioned above, during the second quarter of 2019, we received positive topline results from analyses of pooled MACE and MACE+ data from its Phase 3 trials for roxadustat, enabling our U.S. NDA submission to the FDA. We evaluated the regulatory milestone payment associated with this NDA submission and concluded that this milestone became probable of being achieved in the second quarter of 2019. Accordingly, the consideration of \$50.0 million associated with this milestone was included in the transaction price and allocated to performance obligations under the U.S./ RoW Agreement in the second quarter of 2019. We submitted our NDA to the FDA in December 2019, which was accepted for review in February 2020.

On December 17, 2018, FibroGen Beijing, received marketing authorization from the NMPA for roxadustat, a first-in-class HIF-PH inhibitor, for the treatment of anemia caused by CKD in patients on dialysis. This approval triggered a \$6.0 million milestone payable to us by AstraZeneca. On December 29, 2018, FibroGen Beijing received First Manufacturing Approval for a Product in the Field in the Territory, which allows production for Phase 4 clinical studies, patients' early experience programs, donation programs, as well as to supply products for testing and assessments required prior to launch. This approval triggered a \$6.0 million milestone payable to us by AstraZeneca.

As mentioned above, in the fourth quarter of 2018, we were engaged in the final stages of review with our partners over the proposed development of roxadustat for the treatment of CIA. AstraZeneca and Astellas approved the program in December 2018 and January 2019, respectively. Costs associated with the development of this indication are expected to be shared 50-50 between our two partners. In addition to CIA, in December 2018, anemia of chronic inflammation ("ACI") and multiple myeloma ("MM") have been approved for development by AstraZeneca and is expected to be fully funded by them. For revenue recognition purposes, we concluded that the approval of additional research and development services for these new indications represent modifications to our collaboration agreements in the periods in which approval was received. The research and development services associated with the new indications are distinct from other promises in our collaboration agreements, and will be accounted for separately. The development service period for roxadustat for the treatment of CIA, ACI and MM under the AstraZeneca agreements is estimated to continue through the end of 2024, to allow for development of these additional indications.

Exhibit 31.1

CERTIFICATION

- I, Enrique Conterno, certify that;
- 1. I have reviewed this annual report on Form 10-K of FibroGen, Inc.;
- 2. Based on my knowledge, this report does not contain any untrue statement of a material fact or omit to state a material fact necessary to make the statements made, in light of the circumstances under which such statements were made, not misleading with respect to the period covered by this report;
- 3. Based on my knowledge, the financial statements, and other financial information included in this report, fairly present in all material respects the financial condition, results of operations and cash flows of the registrant as of, and for, the periods presented in this report;
- 4. The registrant's other certifying officer(s) and I are responsible for establishing and maintaining disclosure controls and procedures (as defined in Exchange Act Rules 13a-15(e) and 15d-15(e)) and internal control over financial reporting (as defined in the Exchange Act Rules 13a-15(f) and 15d-15(f)) for the registrant and have:
- (a) Designed such disclosure controls and procedures, or caused such disclosure controls and procedures to be designed under our supervision, to ensure that material information relating to the registrant, including its consolidated subsidiaries, is made known to us by others within those entities, particularly during the period in which this report is being prepared;
- (b) Designed such internal control over financial reporting, or caused such internal control over financial reporting to be designed under our supervision, to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles;
- (c) Evaluated the effectiveness of the registrant's disclosure controls and procedures and presented in this report our conclusions about the effectiveness of the disclosure controls and procedures, as of the end of the period covered by this report based on such evaluation; and
- (d) Disclosed in this report any change in the registrant's internal control over financial reporting that occurred during the registrant's most recent fiscal quarter (the registrant's fourth fiscal quarter in the case of an annual report) that has materially affected, or is reasonably likely to materially affect, the registrant's internal control over financial reporting; and
- 5. The registrant's other certifying officer(s) and I have disclosed, based on our most recent evaluation of internal control over financial reporting, to the registrant's auditors and the audit committee of the registrant's board of directors (or persons performing the equivalent functions):
- (a) All significant deficiencies and material weaknesses in the design or operation of internal control over financial reporting which are reasonably likely to adversely affect the registrant's ability to record, process, summarize and report financial information; and
- (b) Any fraud, whether or not material, that involves management or other employees who have a significant role in the registrant's internal control over financial reporting.

Exhibit 32.1

CERTIFICATION

Pursuant to the requirement set forth in Rule 13a-14(b) of the Securities Exchange Act of 1934, as amended (the "Exchange Act"), and Section 1350 of Chapter 63 of Title 18 of the United States Code (18 U.S.C. §1350), Enrique Conterno, Chief Executive Officer of FibroGen, Inc. (the "Company"), and Pat Cotroneo, Chief Financial Officer of the Company, each hereby certifies that, to the best of his knowledge:

- 1. The Company's Annual Report on Form 10-K for the year ended December 31, 2019 (the "Annual Report"), to which this Certification is attached as Exhibit 32.1, fully complies with the requirements of Section 13(a) or Section 15(d) of the Exchange Act, and
- 2. The information contained in the Annual Report fairly presents, in all material respects, the financial condition and results of operations of the Company.

In Witness Whereof, the undersigned have set their hands hereto as of the 2nd day of March, 2020.

Presentation

Operator

Ladies and gentlemen, thank you for standing by, and welcome to the FibroGen First Quarter 2020 Financial Results. [Operator Instructions] Please be advised that today's conference is being recorded. [Operator Instructions]

I would now like to hand the conference over to your speaker today, Mr. Michael Tung. Please go ahead, sir.

Michael Tung

Investor Relations Executive

Thank you, operator, and good afternoon, everyone. Thank you for joining us on today's call to discuss FibroGen's results for the first quarter of 2020. Today's call will be led by Enrique Conterno, our Chief Executive Officer. Enrique will be joined by Dr. Peony Yu, our Chief Medical Officer; Ms. Chris Chung, our Senior Vice President of China Operations; Dr. Elias Kouchakji, our Senior Vice President of Clinical Development, Drug Safety and Pharmacovigilance; and Mr. Pat Cotroneo, our Chief Financial Officer.

Before we begin, I would like to point out that we may make forward-looking statements regarding our business, including our collaborations with AstraZeneca and Astellas; financial guidance; the initiation, enrollment, design, conduct and results of clinical trials; our regulatory strategies and potential regulatory results; our research and development activities; commercial results and results of operations; risks related to our business; and certain other business matters.

For risks and uncertainties regarding our business and statements made on the call today as well as factors beyond our control that may cause differences between current expectations and actual results, we refer you to our annual report on Form 10-K for the fiscal year ended December 31, 2019, and to our quarterly report on Form 10-Q for the quarter ended March 31, 2020, filed with the Securities and Exchange Commission. Copies of these filings can be found in the Investors section of our website.

We undertake no obligation to update any forward-looking statement, whether as a result of new information, future development or otherwise. The format for today's call includes prepared remarks from FibroGen's management team, and then we'll open the lines to take your questions. The press release reporting our financial results and business update and the webcast for today's conference call can be found on the Investors section of FibroGen's website at www.fibrogen.com.

And now I would like to turn the call over to Enrique Conterno, our CEO. Enrique?

Enrique A. Conterno

CEO & Director

Thank you, Mike. Good afternoon, everyone, and welcome to our first quarter 2020 earnings call. Given the challenges presented by the COVID-19 pandemic, I would like to take a moment on behalf of FibroGen to reassure patients, health care providers, investigators and stakeholders of our continued commitment to bring to patients our potential, first-in-class medicine for the treatment of chronic and life-threatening conditions. Governments, businesses and society in general, have taken unprecedented measures to mitigate the spread of the COVID-19 outbreak.

Like many businesses, FibroGen has taken a number of actions to support both our workforce and communities in these challenging times. In the U.S., our employees are working remotely when possible. While in China, they are now back working in our offices, manufacturing plants and the field. We have implemented protocols globally to minimize the risk of illness for our employees who need to work on-site at any of our facilities.

Despite the difficult circumstances, we remain committed to ensuring the regulatory and commercial success of roxadustat, a potentially transformational oral medicine in anemia therapy first demonstrated in patients with chronic kidney disease.

With pamrevlumab, we are implementing a comprehensive plan to accelerate development across the 3 indications of idiopathic pulmonary fibrosis, or IPF, locally advanced unresectable pancreatic cancer, or LAPC, and Duchenne muscular dystrophy or DMD once the situation with COVID-19 improves.

Finally, we continue to advance the innovation of our hypoxia-inducible factor, or HIF, and connective tissue growth factor, or CTGF, platforms.

Our business continuity plans are in effect, and we're seeing an impact to our operations resulting from COVID-19, we remain confident that FibroGen has the resources and capabilities to navigate through these uncertain times and achieve our stated goals.

As China comes back online, we are continuing our manufacturing operations and launch efforts there. We have ample drug supply to support both the roxadustat launches and clinical trials in additional indications as well as the pamrevlumab clinical trials.

We will continue to monitor the situation closely. To our employees and patients and to the thought leaders, clinicians, regulators and countless others who interact with FibroGen, please know our thoughts are with you, and your families.

Now let me begin with roxadustat. During the first quarter, our roxadustat NDA submission was accepted by the FDA, and interaction with the FDA on the file continues. We expect action by the PDUFA date of December 20, 2020.

In Europe, the Marketing Authorization Application filing for roxadustat for the treatment of anemia in both dialysis- and non-dialysis-dependent patients with CKD is expected in the second quarter of 2020. We and our partners are working diligently in preparation to make this novel, first-in-class medicine available to as many patients worldwide as quickly as possible.

Turning to China. As you know, roxadustat was first approved in China and was included in the National Drug Reimbursement List, or NRDL, which went into effect at the beginning of the year. A key focus has been and continues to be expanding hospital listing so that roxadustat can be widely prescribed. We saw positive momentum in hospital listings in January before the start of the COVID-19 restrictions, which caused a slowdown in new listings from late January to late March. As we stand here today, we have seen a steady return to a new normal in China, and we continue to be encouraged by the roxadustat opportunity there.

The COVID-19 pandemic, however, is still causing disruption in clinical trials across the globe. And the FDA, EMA and other regulatory agencies have issued guidance for the conducts of clinical trials during the pandemic. We are incorporating these regulatory recommendations as appropriate are closed on clinical trials.

Our first priority at FibroGen is ensuring the safety and well-being of the patients participating in our studies.

While we do not intend to provide specific details on the COVID -- on the impact of COVID-19 for each one of our trials, we can say that we have seen an impact across all of our trials to varying degrees. Our most effective trial is pamrevlumab's ZEPHYRUS IPF trial where we decided to pause near-term enrollment for the safety of patients and are currently focused on providing continual care for the patients who had already been enrolled. The rest of our trials continue enrollment, albeit, at a slower rate.

In 2020, we are committed to accelerating and expanding the development of pamrevlumab. To that end, we have developed a comprehensive plan, which includes clinical site activations, geographic expansion and protocol amendment, such that, once things return to a new normal, we can be in the best position to accelerate enrollment.

Our locally advanced unresectable pancreatic cancer study continues to enroll. We continue preparations for ZEPHYRUS 2, our second IPF Phase III study, and our Phase III program in Duchenne muscular dystrophy is slated to begin in the second half of the year.

In summary, despite COVID-19, we continue to be focused on getting roxadustat approved in the U.S., advancing pamrevlumab development; and finally, leveraging our expertise in both hypoxia-inducible factor, and connective tissue growth factor biology to expand our pipeline of novel drug candidates.

Now I will turn it over to Peony, who will provide you with a more in-depth discussion of roxadustat.

K. Peony Yu

Chief Medical Officer

Thank you, Enrique, and good afternoon, everyone. Our 2020 start has been busy. And today, I would like to review some of the roxadustat highlights thus far this year.

As Enrique mentioned earlier, we continue to expect an FDA decision on our roxadustat NDA by the PDUFA date of December 20, 2020. We have no indication the FDA will hold an Advisory Committee Meeting, but we continue to prepare diligently in case, one is scheduled.

To ensure success in the U.S., we and our partner, AstraZeneca continue commercialization preparations. We plan to submit our Phase III individual study and pool efficacy and safety manuscripts for publication over the coming months.

In Europe, the Marketing Authorization Application filing for roxadustat for treatment of anemia in both dialysis- and non-dialysis-dependent CKD patients is expected in the second quarter of 2020.

In Japan, our partner, Astellas, continues the commercial launch of Evrenzo, the Japan brand name for roxadustat for treatment of anemia in dialysis-dependent patients. Astellas' supplemental NDA for anemia in non-dialysis patients is currently under review by PMDA.

We recently presented new analyses from our Phase III roxadustat trials at the annual National Kidney Foundation Spring Clinical Meeting.

And the conclusions can be summarized as following: in our non-dialysis patients, roxadustat achieved comparable hemoglobin correction with similar doses regardless of iron status at baseline. Roxadustat treatment resulted in a statistically significant reduction in red blood cell transfusion risk of 74%. 40% of the patients in this non-dialysis patient pool were not iron replete or did not have sufficient iron stores to even qualify for ESA treatment.

Furthermore, roxadustat reduced the risk of red blood cell transfusion and IV iron rescue compared to placebo in non-dialysis CKD patients, regardless of iron status at baseline.

Finally, roxadustat significantly reduced the risk of red blood cell transfusion in dialysis patients versus epoetin alfa.

Let me point out roxadustat's reduction of transfusion risk goes hand-in-hand with the superior hemoglobin efficacy achieved in our primary endpoint analysis compared to EPO. Roxadustat's superior hemoglobin change and transfusion reduction are accompanied by favorable cardiovascular safety results, particularly.

In the 1,530 patient incident dialysis pool, roxadustat had a 30% lower risk of MACE and 34% lower risk of MACE+ than epoetin alfa. This is highly relevant as 86% of U.S. dialysis patients have now received ESA therapy in the 12 months prior to the initiation of dialysis.

Collectively, these results give us confidence that roxadustat may have a differentiated product profile for dialysis-dependent patients. Beyond CKD, our vision is for roxadustat to become the standard of care for anemia broadly. We continue development of roxadustat for the treatment of anemia associated with myelodysplastic syndrome, or MDS, and chemotherapy-induced anemia, or CIA.

We also continue to evaluate roxadustat for the treatment of anemia associated with additional diseases. Starting with our Phase III global study evaluating roxadustat for the treatment of anemia in MDS, we presented positive results from open-label portion of this study at American Society of Hematology 2019 and are now conducting the randomized double-blind placebo-controlled portion of the study. As a reminder, this second portion of the study will enroll approximately 160 transfusion-dependent MDS patients in a 3:2 randomization, and the primary efficacy measure is percent of patients who achieved transfusion independence.

Staying in the hematology/oncology space, we also have an ongoing Phase II open-label study in CIA, which continues to be an unmet medical need. We will continue to monitor, assess and manage the impact of COVID-19 with patient safety as our top priority. We thank all our investigators for their commitment and partnership in developing new treatment option for patients.

Finally, in collaboration with our partner, AstraZeneca, roxadustat Marketing Authorization Application for CKD anemia have been submitted in a number of countries, including Canada, Australia, Mexico, Brazil, Taiwan and South Korea.

I would now like to turn the call over to Chris Chung who will discuss the recent developments for roxadustat in China.

Christine L. Chung

Senior Vice President of China Operations

Thank you, Peony. I'm excited to share details of the positive progress made during the first quarter on the roxadustat launch in China. As many of you know, roxadustat was included in the 2019 National Reimbursement Drug List last November. It became effective January 1 of this year, and the government is ensuring that rollout is completed on an accelerated basis.

Hospital visitings have been a key focus of our large efforts and the top priority of the AstraZeneca-dedicated roxadustat sales team. We are pleased with our progress to date. Roxadustat is now listed and available at many hospitals within our target universe. We are particularly pleased with the penetration as top-tier Class 3 institutions, which are the larger accounts and also where key opinion leaders and early adopters practice. We believe the hospitals where we are listed to date represent greater than 30% of the potential CKD anemia market opportunity in China.

Roxadustat net sales were just under \$5 million for the quarter. Q1 represents the first quarter after the inclusion of roxadustat in NRDL, and obviously, sales were affected by the COVID-19 pandemic.

From late January through the end of February, China was essentially locked down, and sales visits were completely stopped. During that time, physicians and hospitals were largely focused on treating COVID-19 patients. The number of non-dialysis outpatient visits were highly impacted and dialysis visits were also affected but to a lesser degree.

Looking forward to Q2, we expect our operations in China to return to a new normal, where social-distancing rules will continue to apply. Sales representatives are now able to conduct sales visits, and hospital visiting committee meetings are being scheduled. Many forms of scientific engagement have moved to digital, where disease education, case discussions and roxadustat experience of sharing are now being conducted primarily online, in a virtual manner. We have seen roxadustat utilization across different patient populations, including hemodialysis, peritoneal dialysis and non-dialysis and in both ESA naive and ESA-treated patients.

We continue to be encouraged by the unique value proposition of roxadustat in the treatment of anemia and CKD, in particular, within the treatment setting in China, given the reduced need for intravenous iron to achieve target hemoglobin levels, even in the presence of inflammation as well as the oral route of administration.

We look forward to keeping you updated as we advance our work towards the long-term goal of making roxadustat the standard of care in treating CKD anemia patients in China.

I will now turn the call over to Elias who will provide an update on the pamrevlumab program. Elias?

Elias Kouchakji

Senior Vice President of Clinical Development, Drug Safety & Pharmacovigilance

Thank you, Chris, and good afternoon. Today, I would like to provide an update on our pamrevlumab program given the COVID-19 development over the recent months.

As you all know, we are developing pamrevlumab in 3 separate orphan diseases. At the time of our last earnings call, we were enrolling ZEPHYRUS, a randomized double-blind, placebo-controlled Phase III study evaluating pamrevlumab in IPF and announced plans to initiate a second similar Phase III trial in IPF named ZEPHYRUS 2.

Given the recent COVID-19 pandemic, in order to ensure patient safety in this vulnerable population with compromised lung function, we have decided at this time to temporarily pause enrollment of ZEPHYRUS Phase III clinical study.

The safety of our patients is our top priority, as we continue to assess this dynamic situation and we continue to work with investigators to provide care and clinical trial continuity for patients who are already enrolled in this trial. Prior to posing enrollment, we were focused on accelerating enrollment of our ongoing ZEPHYRUS Phase III study in preparing to initiate the ZEPHYRUS 2 trial. To the extent possible, we continue these preparations, such as when we are able to restart enrollment, we will hit the ground running.

Moving on to our locally advanced unresectable pancreatic cancer, or LAPC, program. LAPIS is our ongoing randomized double-blind, placebo-controlled Phase III trial in patients with LAPC. As you know, these patients have a great prognosis, and we are working with our investigators and clinical trial site staff to implement changes, which mitigate the risk to patient and comply with regulatory and government quidance.

We continue to prepare to initiate a Phase III trial, LELANTOS, evaluating pamrevlumab as a treatment for Duchenne muscular dystrophy, or DMD, in the second half of 2020. There is a significant interest for DMD health from the DMD health care providers and patient communities. This global trial will be a randomized double-blind, placebo-controlled Phase III trial of pamrevlumab in patients with non-ambulatory DMD. It will enroll approximately 90 patients randomized 1-to-1 to placebo and have a treatment period of 52 weeks.

Now I will turn the call over to our CFO, Pat Cotroneo, for the financial update. Pat?

Pat Cotroneo

Senior VP of Finance & CFO

Thank you, Elias. As announced today, total revenue for the first quarter of 2020 was \$24.4 million as compared to \$23.9 million for the first quarter of 2019. The current quarter revenue consists of \$19.4 million in development revenue plus net product revenues of \$5 million for roxadustat sales in China. For the same period, operating costs and expenses were \$105.5 million and net loss was \$78.3 million or \$0.89 per basic and diluted share as compared to operating costs and expenses of \$72.7 million and a net loss of \$45.4 million or \$0.53 per basic and diluted share for the first quarter this year.

Included in operating costs and expenses for the quarter ended March 31, 2020, was an aggregate noncash portion totaling \$22.1 million, of which \$16.9 million was a result of stock-based compensation expense as compared to an aggregate noncash portion of \$20.4 million, of which \$16.4 million was a result of stock-based compensation expense for the same period in the prior year. At March 31, FibroGen had \$598.4 million in cash, cash equivalents, restricted time deposits, investments and receivables.

As previously stated, in accordance with the U.S. GAAP, we recognized in our Q2 2019 financial results a total of \$180 million of milestone payments, when achievement became probable. The amount was comprised of \$50 million for anticipated milestone from AstraZeneca related to the filing of the U.S.

NDA, which was received on April 1, 2020, and \$130 million in anticipated milestones from Astellas in connection with the EU MAA filings, which we expect to occur in the second quarter this year.

Based on these milestone payments and our latest forecast data, we continue to estimate our 2020 ending cash balance of cash, cash equivalents, restricted time deposits, investments and receivables to be in the range of \$720 million to \$730 million, assuming U.S. NDA approval in Q4 2020.

Looking ahead, we have a total of \$375 million in anticipated milestones expected over the next 15 months for the U.S. and Europe, which includes the aforementioned \$130 million of milestones for MAA submissions, plus \$245 million of milestones on approvals and first commercial sale. At this point in time, we have no changes in expectations in any of the anticipated milestones over the next 15 months. Thank you.

And I would now like to turn the call back over to Enrique.

Enrique A. Conterno

CEO & Director

Thank you, Pat. In closing, FibroGen is well positioned to navigate these uncertain times. We and our partners are committed to making roxadustat available to as many patients across the globe as quickly as possible. We have ample supply of roxadustat drug product to meet demand for the year and ample supply of pamrevlumab for our planned clinical trials.

As roxadustat sales ramp up, our financial position is strong with approximately \$600 million in cash at the end of the first quarter. We have a total of \$375 million in anticipated milestones expected over the next 15 months in the U.S. and Europe, which includes \$130 million of milestones for the MAA filing, plus \$245 million of milestones on approvals and first commercial sale.

In addition, we received full-partner reimbursements for development and commercialization of roxadustat in all geographies, except China, where we share these expenses 50-50 with AstraZeneca. Based on our current forecast, we are reiterating our estimated 2020 ending cash to be in the range of \$720 million to \$730 million and continue to believe we are well financed for years to come.

Now I would like to turn the call back to the operator for questions. Operator?

Question and Answer

Operator

[Operator Instructions] Our first question comes from Michael Yee with Jefferies.

Michael Jonathan Yee

Jefferies LLC, Research Division

Enrique, Peony, guys, two questions from me, if you can hear me, okay?

Enrique A. Conterno

CEO & Director

Yes.

Michael Jonathan Yee

Jefferies LLC, Research Division

There was recently some competitor data that came out this week. Maybe you can just talk about how to put that into context. Importantly, in the dialysis segment, they only had 10% of the population and incident, where you had, I think, upwards of 40%, yet you guys have the same hazard ratio of 0.96. So maybe talk to that data set? And what that would mean, both in incident dialysis and stable dialysis, when you try and compare that data? And then my second question is on China. Chris, I thought you had some good comments there. Maybe talk about how you expect Q2, 3, 4 to ramp as people are modeling sales.

Enrique A. Conterno

CEO & Director

Very good. Thank you very much, Michael, for the questions. I'm going to turn over the question on the recent competitor data to Peony, but let me just make a comment on that. Clearly, this data validates HIF-PHIs, I think, in an important way. But I'm excited for us to be able to also share why are we so excited about roxadustat in terms of the differentiation.

And we will then go to Chris for your questions in China in terms of sales ramp-up. Peony?

K. Peony Yu

Chief Medical Officer

Thank you, Enrique, and thank you, Mike, for asking the guestion. Recent data reaffirms the safety of the HIF class, as Enrique said. In addition, we are reassured that the roxadustat product profile is compelling. This is a great opportunity to remind us about the differentiating aspects of roxadustat.

From an efficacy standpoint, roxadustat is numerically and statistically superior in hemoglobin efficacy endpoint, which then, in turn, translates into clinical benefit of reduction of transfusion in dialysis patients. Our primary efficacy endpoint of change from baseline to weeks 28 to 52 was superior to an active comparator after we met noninferiority comparison. And the P-value is less than 0.001.

Now what is very -- we also have statistically significant reduction in transfusion risk. Importantly, we have demonstrated cardiovascular safety in the overall dialysis population and in MACE. And furthermore, we demonstrated a reduction in MACE+ risk. In our 1,530-incident dialysis patient pool, where the comparison between roxadustat with epoetin alpha started within the first 4 months of dialysis initiation, roxadustat had a 30% lower risk of MACE and 34% lower risk of MACE+ than epoetin alfa, with a trend towards lower or cause mortality, relative to epoetin alfa. Now this is a highly-relevant population. The difference between the incident dialysis and the stable dialysis is that, incident dialysis describes the point of entry, timing of the entry into the study. Patients -- this includes patients who have started dialysis within 4 months of study enrollment and continue receiving treatment well into stable period as the average treatment is around 2 years.

And to address the question of -- that you have brought up about stable dialysis, the other subgroup of the all dialysis patients are patients who entered the study at the time that they have been on dialysis for more than 4 months and continued treatment. When we look at the converted patients or the stable dialysis patients and evaluate and looking at safety -- cardiovascular safety, it does not change any of the conclusions that we have on the -- about roxadustat being safe and efficacious.

And so in conclusion, roxadustat, excellent cardiovascular safety profile, coupled with the statistically significant and clinically meaningful, higher hemoglobin efficacy results and lower transfusion rate relative to epoetin alfa, together makes roxadustat potentially a better treatment option for dialysis-dependent patients. We like the hand that we have and expect the product label to reflect the results of clinical trials on our compound.

Michael Jonathan Yee

Jefferies LLC, Research Division

I appreciate the question because, yes -- because of the stable population and doing the math around that versus them. So incident is important, and I appreciate the response. And maybe Chris, on China?

Enrique A. Conterno

CEO & Director

Chris?

Christine L. Chung

Senior Vice President of China Operations

Yes. Mike, so we continue to be optimistic about second, third and fourth quarter. The way to look at the numbers might be, you saw the Q4 numbers and you saw the Q1 numbers. So what does the Q1 numbers tell you? So there is seasonality in terms of when the things typically come in, in China. So as you know, without listings, you cannot prescribe. So these things are key, but also, there's tremendous momentum coming out of NRDL to list because it makes the drug affordable and it makes hospitals wants a list. So we are very happy with the Q1 numbers. It reflects momentum coming out of NRDL. It reflects a bit of a slowdown because of COVID. We're now coming out of COVID into new normal. It's a little bit touch-andgo, so it's hard to predict based on it, but we continue to be very optimistic in what the rest of the year looks like.

Operator

And our next question comes from Geoffrey Porges with SVB Leerink.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

In NDT versus DD, I'm curious, Chris, first of all, in China, what's your assessment of how this will play out over the long term? Hypothetically, do you think that they're roughly equal? Or do you think that one is going to ultimately be significantly larger than the other?

And then, Enrique, I know you're not responsible for commercialization, but I'd love to hear your color on what you think the situation will be in the U.S. again? Do you think that the opportunity will be larger in dialysis, given your incident dialysis data? Or do you think that the greater opportunity will be getting the non-dialysis claim?

Enrique A. Conterno

CEO & Director

Very good, Geoff. Let me try to address both of your questions. Looking at the relative size of both dialysis and non-dependent-dialysis, clearly, the number of patients that have anemia, and that are on dialysis is significant, but the opportunity to help patients in non-dependent-dialysis is, of course, much, much larger. I view both opportunities as important opportunities. But over time, I view the opportunity in non-

dialysis-dependent patients to be much larger than the opportunity in the dialysis. Of course, we will need to do our job to ensure the patients are accessing treatment for anemia, patients that have CKD.

When it comes to the U.S., I know you give in a minute this way, but I am completely engaged when it comes to ensuring that we can have a successful commercialization of roxadustat. And I had the opportunity to engage, of course, with AstraZeneca. The situation there follows, I think, similar comments in China being the NDD opportunity over time, has a potential to be significantly larger as we develop that market and we ensure that patients are treated. Keep in mind that when we look at patients coming in to dialysis today and we look at the prior 12 months, only about 14% of them are treated for anemia in those prior 12 months. So a great opportunity, I think, to ensure that many, many patients get appropriately treated and clearly, a huge opportunity for market expansion there.

Operator

Our next question comes from Jason Gerberry with Bank of America.

Jason Matthew Gerberry

BofA Merrill Lynch, Research Division

Yes. Just curious, if you can comment on your 2020 roxa publication strategy. I imagine your competitor will be looking to make a splash in ASN later this year. And so I know that there's some data points regarding the roxa program, for instance, the data on the MACE subcomponents for the DD study. Just curious, if we could get any more incremental data published out of you guys later this year? And if you can comment at all on that front. And then maybe just a follow-up for Chris. Help us think about the \$5 million number for China this quarter. Is that a pure demand-driven number? I assume, inclusive of the COVID headwind. You mentioned 30% of hospitals have access to roxa, but I think in prior conversations, you talked about the NDD market requiring more market building. So should we think about that access as being more around the DD opportunity, at least at the onset?

Enrique A. Conterno

CEO & Director

Yes. Thank you, Jason, for the question. I'm going to ask Peony to comment on our publication strategy. We are excited about the publications that we are -- publication planning, what we're trying to do this year. And then I'm going to ask Chris to give us some more color on China. Peony?

K. Peony Yu

Chief Medical Officer

Yes. I am very excited about our upcoming publication plans. We could -- I can say that we are data-rich, and we're working very closely with our 2 partners, Astellas and AstraZeneca, to -- we are committed to submit our Phase III individual studies as well as pool efficacy and safety manuscripts for publications over the coming months. We also plan to submit a number of abstracts to ASN, which will be held in October of this year. Stay tuned.

Enrique A. Conterno

CEO & Director

I'm -- yes, Chris, if you could please answer the question on China, provide little more color.

Christine L. Chung

Senior Vice President of China Operations

Absolutely. So Jason, you asked if the \$5 million is a pure demand number. So the answer is no. The \$5 million represents ex factory revenues from FibroGen Beijing into the channel. In particular, it represents net revenues, which is orders minus VAT, which is 13%, net or distributor's discounts, incentives, commissions. So it's really a pure net numbers into the channel. The difference between the channel inventory, the demand number is the gap. So this is not a demand number. It's a net ex factory number.

The second question, Jason, I believe you asked is whether this represents more DD versus NDD. So what we have seen so far is very consistent with what Enrique said just now. In the long term, the NDD market has more patients, and we can have a significant impact in that patient population because they're currently either not treated or undertreated. But that is a market we need to build. For DD, it's a substitution market. It's a very well-established standard of care and treatment pattern, where either people are converting from standard of care to HIF-PHIs or incident patients are starting with HIF-PHI. We have seen adoption across all the patient types, which is hemodialysis, peritoneal dialysis and very encouragingly, non-dialysis. So the number you're seeing in terms of revenues is shift in from our factory into the channel based on demand from HD, PD and NDD.

Enrique A. Conterno

CEO & Director

If I -- yes, if I could just complement a bit. As you know, Jason, I had responsibility for China as well, when I was at Lilly. To be able to have basically a 30 -- access to 30% of the overall market opportunity post-NRDL listing, I think, is very significant. So we -- that's a great progress. We used to take companies post-NRDL listing basically years to be able to have meaningful market access opportunity in China. I think that's extremely encouraging. I do want to make sure, there wasn't anything, while the \$5 million are just the ex FibroGen sale, net sales, there's nothing unusual when it comes to stocking. The stocking was very normal for the quarter. And I would say, as we look at Q2, Q3 and Q4, we do expect a meaningful rampup.

Operator

And our next question comes from Adam Walsh with Stifel.

Xiaodong Zhang

Stifel, Nicolaus & Company, Incorporated, Research Division

This is Edwin on for Adam. First one, on COVID-19. We know there are published studies showing that COVID-19 patients, even those who have recovered are suffering from long damage, including fibrosis. So do you have any plans to explore pamrevlumab or other pipeline assets in this COVID-19 patient? And I have a follow-up, if I may.

Enrique A. Conterno

CEO & Director

Yes. Thank you for your question, Adam. I'm going to ask Elias to comment, but just we are planning to study pamrevlumab in hospitalized patients with COVID-19. And we see 2 potential applications in the acute setting, to improve oxygenation and also in the post-acute setting, to ameliorate lung fibrosis.

I'm going to ask now Elias to make a few more comments or reasons to why we are excited about this additional opportunity to be able to help patients with COVID-19. Elias?

Elias Kouchakji

Senior Vice President of Clinical Development, Drug Safety & Pharmacovigilance

Thank you for your call. So as Enrique is saying, we are looking at these studies currently, and we're discussing these studies with regulators, such as the FDA and other European regulators. We are moving forward with planning for these studies. And the difference is, as we know, there is 2 stages of the COVID-19: the acute phase, the first 15 days; and the residual phase. In the acute phase is -- there is a big lack of oxygenation, which is obviously, is important part that is leading to a lot of difficulties in treating these patients. Pamrevlumab is -- can have some effect. We have some data that to show, that is -- we can affect the leakage at the level of the vessels in [introduced] edema and might facilitate oxygenation. And the long-term said that this patient is showing interstitial lung fibrosis and lung disease, specifically after the Acute Respiratory Distress Syndrome. In IPF, we have shown our good effects on fibrosis, and we believe that this potentially that CTGF is similarly is affecting fibrosis, which we know it is from our radiation-induced lung fibrosis that we can slow down or stop that progression of the fibrosis. And we are planning forward to discuss these studies soon and planning to move forward with them.

Xiaodong Zhang

Stifel, Nicolaus & Company, Incorporated, Research Division

Great, great. My next one. Earlier this week, a competitor discloses upper bounce of noninferiority margin of 1.25, which is agreed by the FDA. Should we assume that it is the -- you -- hold you to the same standard or review and approval?

Enrique A. Conterno

CEO & Director

Yes. Thank you. I will try to answer this pretty quickly. I think we have as stated this before. We feel that the overall cardiovascular data that we basically have on both DD and NDD is quite compelling. And we feel that roxadustat presents an important -- has an important benefit risk ratio. As we stated before, questions about noninferiority will be a part of a review decision for roxadustat, but we feel very confident in terms of what we have been able to show and the benefit risk profile that the product has.

Operator

And our next question comes from Yaron Werber with Cowen.

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

And congrats on China. I mean it looks like it's off to a really terrific start. I had a quick question relating to -- maybe just your thoughts, and I don't know if you can comment a little bit ahead into the U.S. launch, early next year, in the dialysis setting and specifically, with the benefit of TDAPA. With TDAPA drugs like roxa should, once included, have a financial incentive to get used. Earlier, I think it was last week, Amgen noted that Parsabiv has seen a decent uptick in small and sort of medium-sized dialysis clinics, but much -- face much bigger headwind sort of really getting into DaVita and Fresenius. So thoughts about, sort of how would you tackle that to make roxa sort of more attractive for them. And then I have a quick follow-up as well.

Enrique A. Conterno

CEO & Director

Yes. Thank you. I think -- thank you for your question. Clearly, TDAPA offers, I think, an incentive to make sure that innovative products are included as part of the treatment protocol for dialysis centers. And I think it's designed for a product such as roxadustat.

Just to maybe speak a little bit about the process. Once we receive approval, we will have to submit for -to be reimbursed under this system, this TDAPA system. We expect that within 3 months, we will be able
to get that designation. And clearly, as we think about that, just like we will be preparing for any launches,
clearly, in this particular case, the large dialysis organizations are key in terms of their adoption, and you
can be reassured that we are, and AstraZeneca, is working closely with them to ensure that we can have
the very best adoption possible and ensure that innovation is included in the treatment of patients in the
dialysis centers, and that is included fast. So I can't speak for other companies, but I feel good about the
plans and how we're solidifying those plans now.

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

Okay. And just another question. At sometimes, Peony, I think maybe you touched upon this, do you have plans to release the data for the prevalent dialysis on its own? I mean you've done really a terrific job showing us the incident dialysis data and overall dialysis. And just curious about the prevalent dialysis as that accounted for about 80% of patients in the market.

Enrique A. Conterno

CEO & Director

Yes. I'm going to ask Peony to address the question. I assume it is talking about the stable dialysis. Peony, any -- what are our plans when it comes to releasing that particular data?

K. Peony Yu

Chief Medical Officer

Yes. As I mentioned, our incident dialysis data also contains prevalent dialysis data in that. Incident was the first 4 months, that's the entry into the study, and patients continue receiving treatment. And so they are the prevalent patients. And I've mentioned earlier that we have looked at the patients who -- the stable dialysis or the prevalent dialysis patients who have been on dialysis for 4 -- more than 4 months at the time that they enter our Phase III study. And we are very comfortable with the efficacy and the safety data in that subgroup. And that's -- the results does not change our conclusion or confidence about our product. And there, it is very likely that we will -- we may share this data, and I wanted to remind ourselves that, that was not necessarily a -- that analysis was not a prespecified analysis. And so we are still comfortable with it. And the most important, to keep in mind is that the overall data, overall dialysis, which was the prespecified analysis and that we have already disclosed that and reiterate that the 86% of the patients who start dialysis have not had received any ESA treatment for the anemia. And therefore, incident dialysis where we take those patients within the first 4 months into the study, and we consider that data to be highly relevant. And we believe that we may have the largest incident dialysis patient pool in CKD anemia programs.

I'm sorry. Enrique, did you want to add something?

Enrique A. Conterno

CEO & Director

Yes. Thank you, Peony. I -- the only thing that I wanted to add Yaron, was you talked about the incident dialysis being 20% of the market. I think it's -- that's correct for the first year, right? You're thinking of -- but unfortunately, the mortality of patients in dialysis is very high. So having a product that is differentiated in incident dialysis is given that it's a natural point for a treatment decision, when it comes to anemia starting dialysis. We found it's particularly important in order to have preference for that treatment. And we believe that roxadustat is uniquely -- is going to be uniquely positioned there. Thank you.

Operator

And our next question comes from Paul Choi with Goldman Sachs.

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

Maybe my first question is for Peony and with regards to the double-blind portion of the Phase III MDS trial. Can you maybe just comment on -- are you seeing -- thinking about any potential impacts to time lines, just given that the patients have to be conditioned for their MDS treatment before potentially receiving roxa? And then, I had a follow-up on Europe.

Enrique A. Conterno

CEO & Director

Peony, go ahead.

K. Peony Yu

Chief Medical Officer

Yes. I wanted to clarify that unlike -- look, a [matter of] product trial, in terms of trial design, our MDS trial includes patients who are treatment-naive and those who have failed ESA. And then, we are also includes patients who are ring sideroblast positive and ring sideroblast negative. The trial is a global study and include study sites and patients in the U.S. and in Europe. I hope that answers.

And then, we are now at the double-blind, placebo-controlled portion of the study. And as you alluded to, I just wanted also remind ourselves that we have a share of very encouraging positive data of the open-label segment of this study at the American Society of Hematology in 2019. I hope that answered the question.

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

I guess maybe to put it in a different way, Peony, just given the situation with COVID and the risk to MDS patients, who have to go through chemotherapy or conditioning, do you see any changes to the time line for your Phase III?

K. Peony Yu

Chief Medical Officer

Oh, okay. Now I wanted -- actually, there is a little impact on our trial -- on a Phase III trial for the following reasons, because now the patients we enroll are already transfusion-dependent. So they are -- they do need to be monitored and treated by their physician, or in other words, they're tethered to the health care system. And participation in our trial, where we provide an oral medication to reduce the risk of transfusion, it's view, if you can think about this -- think about it this way, that it could be favorable, if patients could have less -- will require less transfusion. That can translate into less exposure risk. Does that make sense?

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

Yes. That's helpful. And then regarding Europe, as you're approaching the MAA here in the coming -- end of this quarter, and as you look maybe on the forward here and think about commercialization, just with regard to the different European views on using roxa in the 2 populations, can you maybe comment on how you expect adoption might go there between yourself or what your partner might see as you think about the early launch curve there?

Enrique A. Conterno

CEO & Director

Yes. Clearly, as we have stated, we are expecting filing in Europe this second quarter. And clearly, as you know, when it comes to Europe, different markets behave differently. This is a good question for Astellas, but we need to keep in mind that in some markets, you can make the product -- you can launch the product right away, like in Germany and so forth. In some other markets, you need to go through -- be able to get some reimbursement. So there's going to be a market-by-market decision, and we look forward to helping as much as we can, Astellas as they're really the drivers when it comes to commercialization, of course, in Europe.

Operator

And our next guestion comes from Difei Yang with Mizuho.

Alexandre N. Bouilloux

Mizuho Securities USA LLC, Research Division

This is Alex on for Difei. I was wondering if you could comment a little bit on the NDD setting in the U.S. Specifically, I was interested in -- if you could talk about what is the standard of care there. How are ESAs used today? And what do you think are the benefits of having a placebo comparator in that setting? And then along with that, I was wondering whether or not you would expect the black box warning on approval?

Enrique A. Conterno

CEO & Director

Very good. I'm going to try to pass this to Peony. I'll try to answer the last part of your question. Clearly, I think what we said is that the data, the data that we have, we do not believe wants a black box, but this is a decision for the regulators. I'm going to ask Peony to comment on NDD and the standard of care. Unfortunately, many patients are not treated for anemia that do have anemia. And so there's an opportunity for -- to improve the treatment rate. But Peony, you can talk about the standard of care and maybe provide some color in the United States.

Peony?

K. Peony Yu

Chief Medical Officer

Sorry, I just -- thanks for reminding me to be unmuted. So thank you for the question. We do believe that non-dialysis-dependent patients, anemia is largely an unmet medical need, and this offers a great opportunity for roxadustat to improve care in this population. What I mean by that is that because of cardiovascular safety concern of ESA, their treatment of non-dialysis patients with ESA is limited to keeping hemoglobin less than 10. And in the literature, there's extensive evidence that keeping patients hemoglobin less than 10 is associated with higher transfusion risk. And so there is well-known that, since the label change in ESA in 2011 that the transfusion rate has gone up in the non-dialysis patients, along with the reduction in the treatment rate of non-dialysis patients. And this is reflected by the USRDS data of only about 13.5% of the patients entering dialysis have been exposed to ESA in the 12-month prior.

What does this translate for roxadustat? This is the main reason that we have chosen placebo as the comparator, since no care is the standard of care in the U.S. And in our Phase III program, we have demonstrated a significant increase in hemoglobin level compared to placebo and importantly, significantly reduced transfusion to only about 1/3 of the placebo. And now in -- and our treatment resulted in hemoglobin at around 11, and this was our treatment goal.

And so I also wanted to point out that placebo comparator offers as a comparator is a high bar for comparison for cardiovascular safety because, if one were to choose ESA, that -- as an agent, that already has a box warning for cardiovascular safety. But placebo is the gold standard. With -- in comparison to placebo, we have demonstrated that cardiovascular safety in the MACE endpoint and MACE+ endpoint.

Finally, finally, our talk does not -- in our program, 40% of our patients were not iron repleted, which is a requirement for ESA. So not only are we able to treat the patients to a more therapeutic level of hemoglobin and reduce transfusion, we are going to be able to expand treatment to more patients, even when they're -- they don't have as much iron around. Thank you.

Enrique A. Conterno

CEO & Director

Very good. Thank you, Peony. And I know that we are -- we have already extended our time. So I want to thank everyone for joining our call and for all of your support of FibroGen. Thank you. Thank you very much.

Operator

Ladies and gentlemen, this concludes today's conference call. Thank you for participating, and you may now disconnect. Everyone, have a great day.

ANALYSTS

Jason Matthew Gerberry BofA Merrill Lynch, Research Division

Presentation

Jason Matthew Gerberry

BofA Merrill Lynch, Research Division

Good day, everybody. My name is Jason Gerberry. I cover smid-cap biotech and specialty pharmaceutical for Bank of America. I'm pleased to be introducing our next company presenter, FibroGen and new CEO, Enrique Conterno. FibroGen is -- most would know the company for its development of roxadustat for anemia associated with dialysis or renal disease, but the company also has an emerging early-to-midstage pipeline with pamrevlumab for fibrotic disorders.

So Enrique, first off, thanks for joining us at the conference on a virtual basis.

Enrique A. Conterno

CEO & Director

No, thank you, Jason. It's a pleasure for me to be here and talk about the progress we're making at FibroGen.

Question and Answer

Jason Matthew Gerberry

BofA Merrill Lynch, Research Division

Great. I mean, look, you're no longer new to the role, but I imagine that the opportunity with roxadustat was an important factor as to why you joined the company. As we look at the marketplace for anemia disorders associated with renal disease and chemo-induced anemia, we once upon a time saw almost a \$10 billion market. That's obviously compressed as a result of some label restrictions around the current standard of care. But I'm curious, your views on the HIF class, which is where roxadustat is a drug within. Your thoughts, from a commercial standpoint, can the category get back to those historical peak levels, either on a combined basis or even if the market more gradually or rapidly migrates to HIFs? So maybe we can start there.

Enrique A. Conterno

CEO & Director

Sure. So -- and I think you got it right. I think I -- yes, I joined FibroGen in early January, and part of the reason I joined is, I saw the promise with this transformational medicine for anemia, generally, of course, first, in -- when it comes to CKD. And my answer would be, yes, not only to get to the previous levels when we think about the overall anemia treatment but beyond that. And I think we have to keep in mind that the use was there, the category was larger at that point in time. And the reason we basically saw some of the declines in the category were related to some of the restrictions on the labels for ESAs. Now clearly, all of this needs to come in the context of data. And in particular, I'm excited to talk a little bit more about roxadustat and how I view that when it comes to the data that we have in CKD. And maybe that will be the next section. But clearly, we're also studying roxadustat in chemo-induced anemia, in MDS, and we do have a portfolio of other opportunities that we're looking at for us to truly, not just pursue anemia in CKD, like we are today, where we have the submission accepted in the U.S., expected to submit in Europe in Q2. Commercially, having success in both China and Japan. And of course, that's key, but eventually, we want to make sure that we're treating all sorts of anemia with the promise that roxadustat has.

Jason Matthew Gerberry

BofA Merrill Lynch, Research Division

Got it. Great. And as we think about where the market once was, where it is now, some of the major haircuts, and correct me if I'm wrong, were the CKD stage 3/5 treatment rates have come down quite a bit. The treat to target, the quantity of drug for a class that was priced on a quantity basis in dialysis has gone down. And then the lack of the chemo-induced anemia market has taken a massive hit because of the safety perceptions or implications, however you want to frame it. So from your perspective, are one of those levers really what you see as more near term and sort of the clear opportunity in front. I would imagine it would be the CKD 3/5 treatment rates might be sort of the key low-hanging fruit here, whereas the chemo-induced anemia opportunity probably is a longer-term type of driver.

Enrique A. Conterno

CEO & Director

I think, yes. And I think we do just because of the sequence of how we pursue these indications. Clearly, we are very near the action date by the FDA that's expected, December 20 of this year. And basically what we see and I think you said it well, when it comes to dependent dialysis patients, yes, those patients continue to be treated for anemia, 95% of them. That's -- so the use there on the treatment side, I think, continues. But when it comes to nondependent dialysis, I think we've seen a huge drop off in terms of treatment rates. Today, in fact, what we basically see is for -- when we look at the 12 months prior to going onto dialysis, we see about 13% to 14% use of ESAs in that patient cohort. That number used to be as high as 30%. So clearly, there's a huge opportunity to scale that market up. That needs to be driven by the data. And we think that we have the data to try to support a massive shift in terms of ensuring that anemia is treated in a safe way in patients, both that are dialysis-dependent or nondialysis-dependent.

So that is a more near-term opportunity just because that indication is coming first. But we are pursuing chemo-induced anemia, and we see a pretty large opportunity there as well.

Jason Matthew Gerberry

BofA Merrill Lynch, Research Division

Great. And before we jump into some of the details, how do you see it all fit in? Do you see -- you've got potentially biosimilar ESAs, branded ESAs, potentially multiple HIF in-class competitors? Do you see this market as a dominant treatment option? Do you see the market being more fragmented based on what we know today?

Enrique A. Conterno

CEO & Director

Yes. I -- clearly, I think like any other market I think it's going to depend on the data that the new entrant -- that the new products basically bring and the differentiation that they bring into -- and becoming new standards of care. And I think in this particular case, I think it's pretty significant. I think it's -the differentiation of roxadustat, I think is quite meaningful when -- and I'd like to focus on maybe 3 points. And the differentiation that I think about is not just relative to current treatment, but maybe other potential future treatments. Because keep in mind that FibroGen have -- or had and have the largest library of HIF-PHIs. And there are a number of compounds that the company looked at. And the reason roxa was picked is because we felt it basically provided the best benefit-risk profile for treating anemia. So the -- as I think about this particular class, which, by the way, was further validated by one of our competitors for using data. But in particular, as I think about the differentiation of roxa, number one, I think you have to start with efficacy. Keep in mind that not only do we meet our primary efficacy end points, we were basically statistically superior to EPO on our trials in DD. So that's important. Of course, we also show efficacy. It was relative to placebo in NDD. And quite -- when we look at -- one of the benefits of having achieved efficacy when it comes to hemoglobin is that it translates into lower transfusion rates. We actually had lower transfusions with roxa than with EPO, and of course, much lower relative to placebo in the NDD segment. So that benefit to me, I think, is pretty significant. Clearly, in the -- when we look at the totality of the data, I find our overall cardiovascular data pretty compelling. And in particular, I think we need to highlight the incident dialysis data, whereby we basically show a reduction in risk of MACE events at a time that is critical. And this is -- incident dialysis, basically, covers those patients within the first 4 months of starting dialysis. That is the time when a treatment decision is made when it comes to anemia. So I feel like we are perfectly accurate to wish -- with a huge benefit in that cohort of patients, to be able to have a significant position longer term in that segment. So that I find also quite meaningful. And clearly, the data is highly -- it was -- compared to EPO, it's highly differentiated based on what we can see. And finally, I think something that maybe people don't emphasize as much, but I think we need to keep in mind when we look at the overall NDD segment and we look at the broad spectrum of patients that we were able to enroll, including iron-replete and non-iron-replete as well. So those -- we had a broad spectrum of patients that were -- basically were enrolled in the trial. And I think that's going to be an element of differentiation longer term as well for the product. So I like the chances that given the outcome that are so meaningful with this particular product.

Jason Matthew Gerberry

BofA Merrill Lynch, Research Division

Okay. Now the U.S. market, it's an important market. If you look at consensus, I think that The Street does view the U.S. as a particularly important market. So mindful that this is a process that's being driven, I presume, by your partner, can you talk -- can you share any thoughts regarding your partners' launch preparedness for roxa in the U.S. and/or preparations ahead of any FDA interactions like an Adcom?

Enrique A. Conterno

CEO & Director

Yes. So I -- clearly, the U.S. is the most important market, and we are treating it as such. And yes, I think AstraZeneca is leading much of our commercial preparations. And FibroGen does have an important role,

and I'll speak to that to ensure that we can be as ready and as prepared to be -- truly realize the promise that roxadustat has to be a transformational medicine in CKD anemia.

First, I think -- right now, I think one of the critical elements that we have to work on is, of course, ensuring that we appropriately manage the regulatory process, questions from the FDA and so forth. I think as far as the Adcom, we have received no indication that there will be an Adcom or that an Adcom is planned. It's -- that could change, of course, at any time. But as of today, we have not received such indication. Now regardless of that, we continue to prepare as if we were going to have an Adcom. We need to be ready to ensure if there is an Adcom that we can have the best showing possible of all of our data and all the questions that may be asked.

One other element that is critical is really the overall publication strategy. And you will see a robust publication strategy this year, including a number of abstracts and presentations or presentations as part of ASN. That is a big important target for us. There will be some other medical forum where we release publications, but that is going to be key. And in particular, as we focus on the elements of differentiation that I described. Yes, generally, publication, but really relevant publications, ones that truly matter in terms of the relevance that this product could have in clinical practice.

Finally, as we launch, clearly, it is going to be key that we basically get the right reimbursement for the product and that we are establishing the value proposition for the product for roxadustat in the U.S. marketplace. And I'm delighted to see what I'm seeing from AstraZeneca. I had a chance to meet and review with the U.S. team the plans, and we are in good constant communication, not just at top level but throughout with the different teams. So I'm excited to see the prioritization importance that AstraZeneca is providing to roxadustat in -- as basically, we prepare for a U.S. launch after the PDUFA action data at the end of the year.

Jason Matthew Gerberry

BofA Merrill Lynch, Research Division

Got it. How important -- with ESAs, it's priced in a way that there's more value generated if more drug is consumed with roxa. It's obviously going to be doses that is titrated to the individual level, weight-based. So would you envision a pricing scheme that does capture more value if more drug is utilized and you're treating to higher target hemoglobin levels?

Enrique A. Conterno

CEO & Director

Yes. We are not discussing pricing strategy at this stage. I appreciate the question. As you know, that's probably -- that's not on either AstraZeneca's and FibroGen's best interest to be discussing that publicly at this stage. I think you will hear about our pricing once, basically, we launch the product. But you do raise an important point, which is, at the end, how do we think about the overall value of the product. And keep in mind that, of course, if we broke or reduce this MACE events and then send out a product that on -- a product that reduces transfusions, a product that has good predictable response when it comes to efficacy across many different patients, I think that product can provide significant value, both clinically and also from an economic perspective to the health care system.

Jason Matthew Gerberry

BofA Merrill Lynch, Research Division

Yes. Now whether an Adcom is scheduled or not scheduled, I appreciate the comment that the expectation probably is that it doesn't. So from your perspective, does this have any read-through at all, perhaps how the FDA may be thinking about safety? I know there's a lot of investor focus regarding how safety risk, particularly CV safety risk, ultimately gets characterized to the class relative to the ESA category?

Enrique A. Conterno

CEO & Director

Yes. I -- honestly, I don't think about it that way. It's -- I think it's always not wise to speculate on how the FDA is thinking about something. Keep in mind that an Adcom is typically established to try to get

external feedback on whether it's approvability or a particular labeling or the risk-benefit on a particular subset of the population. So there are a number of reasons why an Adcom could be -- come to life and be called for. But I am quite confident that the FDA, given the data set that we have put forward, will -- based on the data, I think, will have a chance to have the appropriate review and come to all of the right conclusions in terms of the benefit risk profile of the product. Now that doesn't mean that they have an Adcom or not. It's -- and I don't see an Adcom or the lack of as a positive or negative. It's just part of the process.

Jason Matthew Gerberry

BofA Merrill Lynch, Research Division

Got it. Okay. Look, maybe we can just jump ahead to the China launch and the update provided on the 1Q update where I thought that the sales and the commentary around the hospital listing seemed generally positive. It seems like the tone or the messaging regarding the further ramp up in revenue, in this marketplace where you guys would seemingly have at least a 3- or 4-year lead head start versus your competitors, who I think have to satisfy a lengthy clinical burden to get to market. So can you talk a little bit about the -- what you're seeing in China at the moment? And what gets you excited about this market opportunity?

Enrique A. Conterno

CEO & Director

Clearly, I think -- I do. I think I'm excited in that we basically had about \$5 million -- we had \$5 million in net roxadustat revenues in China in Q1. This is the first quarter when we had posted the NRDL. So it's an important quarter to look at. But also, we need to keep in mind that this was a quarter where China was largely under lockdown for much of the quarter, at least 2 of the 3 months. We basically had COVID-19, basically, impacting hospitals, patient visits and so forth. And I think what I've commented on is not just the \$5 million and the fact that we expect a meaningful ramp up in revenue over the next few quarters. But the fact that we are -- we ended with listing that basically represent over 30% of the overall China opportunity. That's -- and this is across both DD and NDD. So I had the opportunity to manage China for Lilly, so I have some experience. And I can say that this is a very meaningful ramp up in terms of access to hospitals for any product. So when I look at hospital adoption, when I look at the adoptions or hospital listing, and when I look at the adoption of the product, the uses of the product within those hospitals, I really like what I see. And I think it gives me confidence, not just for China, but I think what this product would do everywhere else, right? It's very exciting to see.

Jason Matthew Gerberry

BofA Merrill Lynch, Research Division

Yes. How do you think about the pace of hospital listings going forward through the remainder of the year? I think you said you're at 30% right now. And even that, in and of itself, I think you guys have characterized it as pretty unprecedented. I think the U.S. investors generally haven't had to analyze in great level of depth or had great visibility into how the processes work in China. It's very unusual that we analyze the China launch first. So can you help us think about how this evolved?

Enrique A. Conterno

CEO & Director

It does. I think you can look at a number of benchmarks of products that have become blockbusters in China. And when I look at the uptick that we have in terms of listings and access to the overall opportunity, and I will put in parts, despite the fact that we had COVID-19 in the first quarter, I do think it is unprecedented. I expect that the listings and the uptick in listing will continue. So we're not commenting on at this stage, but we intend to provide another comment -- some more commentary at the end of, of course, Q2, both net product sales and listings. But I think what I basically see is that I'm highly encouraged with -- both what we have achieved and also the continuous trends that we basically see in terms of use of the product and listing adoption. One of the...

Jason Matthew Gerberry

BofA Merrill Lynch, Research Division

When you talk about blockbusters in China, are we talking about old drugs like lipitor that were well beyond their western market patent life that hit \$1 billion threshold? Are you talking about more innovative therapies and how those progress?

Enrique A. Conterno

CEO & Director

Yes. I'm really speaking -- I -- given that the NRDL has evolved over the years and provinces adopt reimbursement much quicker than in the past, it's not always fair to just look back and -- but I think you can look at our products today, in some cases, the products are -- they're early in their life cycle and to try to see what is it that they have achieved when it comes to hospital listings. So I'm really thinking of innovative therapies and what is the ramp up. So yes. I -- honestly, if you go back, and I'm going to go back a few years, but you go back 5, 6 years, to get meaningful reimbursement, both reimbursement on hospital leases in China, it used to be a process that used to take years, 4, 5, 6 years, before you had meaningful listings, meaningful reimbursement.

So we are 1 quarter post the NRDL, and we are -- we feel very good about the support that we're getting, the use. And something that I commented on the call briefly was that, importantly, we are seeing use across very different segments, which I think is very important, which is -- because I think it tells you something about the ability to scale these products, whether it's in dialysis centers, whether it's in home dialysis or whether it's in nondependent dialysis. So we've seen uptick across. Of course, we need more data to look at a number of additional parameters, whether it's what's the source of this patient, were these patients naive to therapy, were they on ESA before. So that color, I think we'll be able to provide sometime in the future as we get more and more substantive data. But I think what we basically have seen right now is good use, broad use across all of the segments that we're interested in.

Jason Matthew Gerberry

BofA Merrill Lynch, Research Division

And from a safety labeling perspective in China, can you talk about how it's conveyed or communicated to health care providers, the safety profile relative to ESAs, because one unique aspect of this is that you're doing your MACE outcome trials in this population on a post-market basis?

Enrique A. Conterno

CEO & Director

Yes. So keep in mind that ESAs in China do have a black box, and we do not. So our -- the product profile in China includes, of course, some of the efficacy profile, some of the safety elements, but it does not include, I think as you allude to, all of the pooled safety data from all of our trials and so forth. Clearly, that's -- as we get approval in the U.S., and over time, I expect that more data will be added to our Chinese label. It's difficult to say when will that happen. But right now I think it's the -- I think if I understood your question, our label does not include a black box.

Jason Matthew Gerberry

BofA Merrill Lynch, Research Division

Yes. Okay. Fair enough. And there has been some recent focus from investors regarding competitors in the HIF class. So with data recently released in the dialysis setting, maybe you had mentioned roxa on hemoglobin response being superior. Just wondering how much of that was driven by potentially trial design differences? For example, differences in dosing algorithms and target hemoglobins and the ability to use different rescue treatments. Wondering how one can make that cross-trial inference that maybe one agent might be more affected than another.

Enrique A. Conterno

CEO & Director

Yes. I think if you're -- so let me make a comment on -- which I think is a great opportunity. Anytime a competitor releases data, I think it does a few things. First, I think in this particular case, it reinforces the -- further reinforces the overall HIF-PHI class, okay? But I think it's also an opportunity to highlight

why roxadustat and why I'm so encouraged about roxadustat. And keep in mind that roxadustat, as I mentioned, when it comes to hemoglobin in DD, we basically showed statistical superiority versus EPO. Clearly, that's -- and hemoglobin is something that basically translates to transfusion rates, lower transfusion rates, better achievement of hemoglobin target. So I find that to be a very compelling metric. Now that's something that we have shared, which is that we have lower transfusion rates than EPO. Of course, lower transfusion rates in the case of NDD relative to placebo, but that is an outcome that is very important. I also talked about incident dialysis and the data that we have there. Given that, that is a natural decision point, I feel that our data basically puts us in a different category from any therapy at this stage to be able to raise the needs of those patients. So I really like the hand that we have there. It's a hand that is, I believe, is highly differentiated. And now with the data from our competitor, in a certain way, validates that class, but at the same time it, I think, further highlights the elements of differentiation that are meaningful that we basically we have.

Jason Matthew Gerberry

BofA Merrill Lynch, Research Division

Got it. Great. Well, Enrique, we are up against our time. So I want to thank you so much for joining us and sharing your insights on the latest developments at FibroGen. So thank you very much.

Enrique A. Conterno

CEO & Director

Thank you very much, Jason. It's been a pleasure.

Jason Matthew Gerberry

BofA Merrill Lynch, Research Division

All right. Well, with that, have a good day, Enrique. And operator, we can conclude the call.

FibroGen Inc at Jefferies Healthcare Conference (Virtual)

EVENT DATE/TIME: JUNE 02, 2020 / 7:30PM GMT

CORPORATE PARTICIPANTS

Enrique Conterno FibroGen, Inc. - CEO

CONFERENCE CALL PARTICIPANTS

Michael Yee Jefferies LLC - Analyst

PRESENTATION

Michael Yee Jefferies LLC - Analyst

Hey, everybody, welcome to another afternoon session at the 2020 Jefferies Global Healthcare conference. It has been a fantastic success so far. And up next with us this afternoon I'm really happy to see the CEO of FibroGen, Enrique Conterno, on the line with us there from San Francisco.

Enrique, congrats on all the progress so far since you joined on, I guess end of 2019, and really started to meet everybody at the beginning of 2020 as sort of a big coming out year for you.

Maybe -- I'll turn it over to you. Maybe just give us a brief comment on how things have evolved for you at FibroGen as you have come on. And what are the most important things you're focused on executing on this year? And give us a little bit of context of what's going on at FibroGen right now. And then we're going to go into some of the details, obviously, with a lot of things coming up.

Enrique Conterno FibroGen, Inc. - CEO

Very good. Thank you very much, Michael, for the invitation. I think our priorities here at FibroGen are pretty clear. We have a compelling value proposition with roxadustat, a transformational medicine for anemia. We are of course first pursuing that in CKD anemia, but we're also pursuing additional indications. Regulatory success, the publication plan, planning for reimbursement are all critical for us.

We are very much focused on accelerating the enrollment of pamrevlumab across the three high-value indications that we are pursuing starting with IPF, also LAPC and also Duchenne muscular dystrophy. And as we've related recently, we are also pursuing a couple of COVID trials, which I think can be important and meaningful.

Now finally, leveraging the scientific platforms that we have to bring new products into the clinic. Those are the [priorities] that guide us and I'm very pleased with the progress that we continue to make.

Michael Yee Jefferies LLC - Analyst

That's fantastic. So, you do have a lot on the plate, Enrique, because -- just in brief, you of course were trying to execute on roxa. That's usually the most important; I will get into that. You're trying to execute on pamrevlumab and trying to get that enrolled obviously, which is important.

So, maybe just starting with roxa, you've reported out all the data last year at ASN. You've submitted the NDA, you were accepted in a standard review. You're coming up on your mid-cycle review meeting. Maybe talk with us about how the interactions with the agency have been going.

Peony used to say they were very excited to get that application underway, no issues with that. There's always been a lot of investor controversy around the package and everything. Maybe just talk about how those interactions have been going, even during a COVID environment, of course, and an upcoming mid-cycle review and how you're feeling about this.

Enrique Conterno FibroGen, Inc. - CEO

We are feeling good about the engagement we have with the FDA. As you know, we have a PDUFA date for December 20 of this year. As you well point out, we do have the mid-cycle review coming up, it has been scheduled for now for the month of June, so this month.

We are basically fully engaged and making sure that we are addressing any questions the FDA has and continue to make progress in this review. I think this is critical for us, not only that we get approval, a broad approval, but importantly that we have a very good label.

Michael Yee Jefferies LLC - Analyst

Right. So, digging into that a little bit, you've previously said you do expect at least to get more color on whether or not there's going to be a panel. And mid-cycle reviews, if you look at FDA documents, typically they say you should get a much better picture about that. Is that something you would eventually disclose? How are you feeling about a panel? Would you tell us when you know or wait for an earnings call? That's question one.

And then question two is between now and the PDUFA, what are the gating steps towards getting approved? Is that a factory inspection, manufacturing inspection and launching preparation to help out AstraZeneca? Maybe just talk to between June and December.

Enrique Conterno FibroGen, Inc. - CEO

So, as we have shared in the past, when it comes to an Adcom, typically the FDA communicates a sponsor and this should be planning for an Adcom either pre-submission or during filing acceptance. We have no indication of an Adcom at either those events or now at this stage.

Clearly the mid-cycle review is the last time really where the FDA would typically let us sponsor -- know that an Adcom is coming. Not that it could not happen after that, but clearly the likelihood of it happening decreases substantially after the mid-cycle review.

There are a number of elements that we go through a review which include, like you say, preapproval inspections and so forth. I think the mid-cycle review I think is very informative because, in a certain way at that point, we are basically discussing the overall status of the application with the FDA including any findings that they may have, any issues.

You also, importantly, discuss at the meeting, as you know -- you start a high level discussion around labeling. And finally, I think it is specifically stated that it is also a meeting where you basically finally determining whether an Adcom would be held or not. So, a confirmation or not of whether there's going to be an Adcom.

So, a number of things we are looking forward as we prepare for that meeting. Clearly there is a mid-cycle review. There's a late-cycle review as well, which we expect will happen in September. And then I think at the end you end up being in labeling discussions, which basically that happen in much more detail within the last 30 days.

Michael Yee Jefferies LLC - Analyst

And would you disclose -- if they told you there was a panel would you wait for earnings? And how much is AstraZeneca involved in this? Because you actually I think own the actual NDA. But is a lot of this joint with Astra just in terms of FDA meetings and all that kind of stuff? How does that work?

Enrique Conterno FibroGen, Inc. - CEO

Yes, so we basically are the ones that are leading some of the discussions -- the engagement with the FDA. But of course we are preparing with AZ together to ensure that we have the very best thinking when it comes to ensuring that we can achieve regulatory success.

So, it is truly a joint effort. But we are right now the NDA holders. So, that's where we are. In terms of whether -- if the FDA were to tell us about an Adcom and that we should plan for one, yes, that's something we would plan to disclose. And ideally I think right away after we know.

Michael Yee Jefferies LLC - Analyst

Right away, okay. Fantastic. As you get towards thinking about approval and label, as obviously you are preparing for, what is the perfect label? What is a label you'd like that's for the treatment of anemia in both a CKD dialysis population as well as a non-dialysis population?

What does that look like in terms of the exact indication filed for?

And how do you think about the pluses and minuses about whether they would actually put a black box on that given that it's not the same mechanism as Epogen, right? So, even though it stimulates the production of hemoglobin, it's not the exact same mechanism.

So, given your experience in this field having spent a long time at Lilly blending through these different programs in diabetes, talk to us about how those things are weighed in terms of black boxes. Because I think there's examples in diabetes where some drugs in the same class do and don't, and that's in the same mechanism. Correct me if I'm wrong, Enrique. So, maybe just talk to the label in terms of indications and then how you think about how the FDA thinks about black boxes.

Enrique Conterno FibroGen, Inc. - CEO

Yes, I think -- given the data that we have, I think we warrant a label that is broad both in dialysis and NDD, a label that basically speaks to the safety of the product when it comes to cardiovascular safety. Of course only efficacy that we basically have and, in particular, the fact that we are able to reduce transfusions, which is an intended goal of treating anemia. And we did that -- we did so relative to Epogen in dialysis dependent --.

Michael Yee Jefferies LLC - Analyst

Is that something that can make a label though, Enrique? Is that something that would make a label? These are secondary endpoints.

Enrique Conterno FibroGen, Inc. - CEO

Yes, it is -- the question is -- you are asking when it comes to the label -- clearly this is a secondary endpoint that was included in all of our trials. And the question is in what way is this going to be included or what level of claim can we make I think. So, is it going to be reported as far as the clinical trials in the label? I believe so. What level of claim can we make? And --.

Michael Yee Jefferies LLC - Analyst

Like it would be in the efficacy table, you think that kind of stuff would be in an efficacy table?

Enrique Conterno FibroGen, Inc. - CEO

It could be, not as a primary outcome. As you know, it's clearly -- it is around increasing hemoglobin. And then I think, similarly to that, I think it's important that we get the incident and dialysis data on the label.

Similar to the comment that you were making, it's not like we are going to necessarily an indication around reducing the risk of MACE in incident dialysis. But I do believe that we -- that data warrants(inaudible) for this to be included in the label when we look at the observation what we observed in that population.

Michael Yee Jefferies LLC - Analyst

So, tie that into how the agency thinks about the various scenarios with the black box. Because the idea of having a cardiovascular benefit in the incident dialysis population, an important population but a sub-segment of CKD dialysis. Do they let you put in that Kaplan-Meier curve? I don't know what secondary endpoints are allowed to go into --.

Enrique Conterno FibroGen, Inc. - CEO

So, clearly we -- let's look at the two segments. I think in NDD we basically have a comparison relative to placebo. And therefore when we look at our data, I feel it basically shows that the product is safe, because of the safety profile when it comes to CV comparable to placebo.

In DD, yes, the question could be raised, well, you're comparing yourself to a product that has a black box in DD, and I get that. But in DD, when it comes to incident dialysis, we do show an actual significant benefit with a 30% reduction in MACE. When I put those two reasons together and look at the compelling nature of our data, I feel that the data does not warrant a black box related to CV Safety.

Michael Yee Jefferies LLC - Analyst

Those are two important points. One is you against placebo non-dialysis and you're non-inferior to a placebo. And two is, in a big sub-segment you are actually superior.

Enrique Conterno FibroGen, Inc. - CEO

Correct.

Michael Yee Jefferies LLC - Analyst

And if you go back and look at even drugs in diabetes, are there examples where one had a black box for some issue and others did not even within the same class? Is that possible?

Enrique Conterno FibroGen, Inc. - CEO

It is possible and there are (inaudible). Let's keep in mind we are not the same class even as EPO of course. We are a HIF PHI, so it is a new class. But you do have examples. The FDA tends to make decisions based on the data that is in front of them. And you have classes in diabetes, for example, where different products belong to the same class, some have a black box and some do not.

You can see it in the SGLT2 class and you can see it in the [GLP1s]. So, both important, key leading growth classes where you have the differentiation. Even though products belong to the same class, they do have different relative labels.

Michael Yee Jefferies LLC - Analyst

Perfect. Okay great, great. And then, so once we get all this -- we'll get the label, we'll review it. I'm sure you're very excited about launch. Typically Wall Street says, well look, launches are always tough.

Is this something where you would feel very good about a launch and it would be atypical versus other historical renal launches because maybe it's not in the bundle or maybe there's other reasons? Maybe talk about the push and pull with a launch in a renal setting where, again, Wall Street has been disappointed on renal launches.

Enrique Conterno FibroGen, Inc. - CEO

Well, one has to look at the benefits of the product. And I do view this product as a transformation product for anemia. If you are thinking of dialysis and if somebody is starting dialysis, with the type of benefit that we're showing in incident dialysis, this product should become standard of care.

Now there are mechanisms today due to TDAPA, for example, to be able to ensure that there is an incentive for dialysis organizations to include innovation into their protocols and to do so quickly. As you know as part of TDAPA, that's a decision we'll receive an add-on payment for including this innovation for a period of two years. So, this add-on payment is over and above the bundle and is -- basically that payment is at the level of 100% of the ASP.

So, it is an important factor that CMS and those guidelines to ensure that innovation is brought into the standard of care when treating patients with dialysis.

Michael Yee Jefferies LLC - Analyst

So, the treatment of anemia in CKD is in a dialysis bundle, but here there could be an add-on payment to reimburse users of new technology to offset that. That's the point.

Enrique Conterno FibroGen, Inc. - CEO

That is correct.

Michael Yee Jefferies LLC - Analyst

Why, I'm not sure that the terminology -- people say not in the bundle per se means that it's not a cost. I mean, it's not like it's an outpatient, you see what I'm saying, where they --?

Enrique Conterno FibroGen, Inc. - CEO

Yes.

Michael Yee Jefferies LLC - Analyst

Okay, all right. I think that's fair. Okay, so that's really important if that happens. And you feel very confident that that would be in the TDAPA add-on?

Enrique Conterno FibroGen, Inc. - CEO

I feel that should be the best case. Of course, we had discussions with CMS and we do believe that roxa is eligible. And we are planning to apply as soon as we get approval.

Michael Yee Jefferies LLC - Analyst

Okay, great. Alright, so hopefully that's a positive dynamic. Now there's also some interesting data points already, Enrique, because you have a launch in China. You were appointed \$5 million in the first quarter during a COVID environment in China. I don't think anyone is calling victory yet on \$5 million.

But talk to what you are seeing in China as at least some read through. Is \$5 million good? What happens in the second and third quarters? Because China is kind of obviously not so much in shelter-in-place, and how do you think about the value there in China that you are seeing?

Enrique Conterno FibroGen, Inc. - CEO

I think it is significant and I think it is giving us a lot of confidence about -- given the adoption that the product has. When we look at the \$5 million, yes, it's \$5 million, but it's the first quarter both reimbursement. And keep in mind that that quarter was a quarter where, in China, for two out of the three months we basically had a complete lockdown of the country, so very little activity.

One of the leading indicators that we look at in China is basically how are we doing when it comes to hospital listings. Because you get national reimbursement, but for the product to be prescribed in a hospital, then you need to be listed in that particular hospital. And we are doing, I believe, exceptionally well.

And I look at and benchmark roxadustat to what I'm going to call blockbuster products in terms of achieving hospital listings. And we are benchmarking extremely well relative to any blockbusters that we will benchmark against.

So, for example, after the first quarter we were basically accessing based on the hospital listings we had already over 30% of the anemia market for CKD in China across both DD and NDD. That is very significant for three months. And keep in mind that in that period we had once again a lockdown.

So, what we've seen in China is a significant level of activity post that across not just promotion activity but also hospital listing activity and adoption. So, we expect and, as I mentioned -- as I mentioned, Michael, we expect a significant ramp-up in revenues in the next quarters.

Michael Yee Jefferies LLC - Analyst

Walk me off this math, Enrique, because it was shut down for essentially two out of three months. You did \$5 million and you only have 30% of the hospitals on formulary. Now maybe those are the biggest 30% -- 30% of the numbers, but those are the biggest ones. I don't know it it's -- they're not obviously all equivalent. But is that focused on the bigger ones? So, I don't want to read in just saying, oh, just 30%, gross it up.

Enrique Conterno FibroGen, Inc. - CEO

The 30% represents of the overall opportunity. If you look at number of hospitals it's less than that, but the hospitals represent 30% of the overall.

Michael Yee Jefferies LLC - Analyst

Yes, so you're penetrated 30% of the opportunity on the formulary side and there is already \$5 million okay. And a significant uptake is what you said (multiple speakers).

Enrique Conterno FibroGen, Inc. - CEO

Yes. And for all the reasons that you describe is we feel very good. And there are a number of qualitative elements as well that make us feel good about our uptake there, including the fact that we see use that is not just tailored or focused on one segment.

We basically see use across very different segments that give me the perspective that we have many different ways of growing, many different levers to grow longer-term, including we've seen significant use in NDD, which is going to be immensely important in China.

Michael Yee Jefferies LLC - Analyst

So, there were some NDD sales already in that \$5 million?

Enrique Conterno FibroGen, Inc. - CEO

That is correct.

Michael Yee Jefferies LLC - Analyst

Okay. Last question before I get into some other topics, historically the management and the Board of FibroGen has suggested that China value is underappreciated and you wanted to get national reimbursement and all these other things. Is that still something you would think about in terms of an untapped value doing something? Or is there still stuff you just want to get done with first and we'll talk about it down the road type of thing?

Enrique Conterno FibroGen, Inc. - CEO

Yes, It's a good question. I do believe that the China values and the opportunity there is under-appreciated. That's something that we will provide some clarity down the road in terms of how we ensure we look at capitalizing, making sure that there is visibility to this very tangible value that we basically have given our operations there.

Right now for us at this particular time I think it's critical that we have the organization fully focused on the launch itself. Because -- given the prospect that we have, meaningful profit to build a major blockbuster in China, the optionality that provides for us is very significant in a number of different ways.

Michael Yee Jefferies LLC - Analyst

I mean think about that because there's almost a source of capital. If you were to spin that out or use it to raise capital and spin that. And I'm sure you can get great valuation for that given people would appreciate that and that's a source of capital for you if that was to happen.

Okay. Let me shift gears. Two other things possible, roxa and MDS. Just like with on that, do you think there's Phase 3 data in 2021 as well which could further expand the opportunity, [how] I should think about that? And how do you think about that versus say Acceleron's product. Or I guess it is Acceleron selling to Bristol?

Enrique Conterno FibroGen, Inc. - CEO

I do think that we are expecting that trial to be fully enrolled this year and be able to have some data next year. We do view this product as broader than the product that you are referring to. So we are able to access really a much broader opportunity when it comes to MDS.

We are also -- I do believe that one opportunity that's under-appreciated also is our chemo-induced anemia opportunity, because that's meaningfully even larger than MDS when we look at the opportunity size. And that trial, as you know, is in Phase 2, but we expect to start Phase 3 potentially next year, so it's very exciting for us.

Michael Yee Jefferies LLC - Analyst

Okay, that was a pretty meaningful proportion of EPO sales if you go back.

Enrique Conterno FibroGen, Inc. - CEO

It is and there's no reason why we have great data where we could not reestablish the treatment of anemia in a meaningful way in that setting for those patients.

Michael Yee Jefferies LLC - Analyst

Okay, great. And then in the last couple of minutes, shifting gears from all the value potential out of roxa -- Pamrevlumab, on one hand I feel like timelines are a little bit long because LAPC, or local advanced pancreatic cancer, for those listening, is enrolling. I don't think you've said it's completed enrollment.

And then on IPF there were some COVID delays there, so that's still getting underway. So, it feels like timelines are [wrong]. Do you still feel like you could have resection rate data in 2021?

Enrique Conterno FibroGen, Inc. - CEO

Yes, so we have not provided timelines when it comes to any of our programs at this stage. I think what we've shared is that we intend to provide specific timelines in the second half of this year when it comes to pamrevlumab on every single other program. Just maybe an update because we have a number of moving pieces here.

But when it comes to IPF, as you know, we had post-enrollment for that IPF trial given the vulnerability of those patients. I'm pleased to report that we are restarting enrollment on a side-by-side basis as we speak. So, that's happening as we speak.

Clearly for us I think site activation is key. That's expanding the number of sites in a dramatic way. I think it's critical to achieve the enrollment timelines that we need. And as part of that we are, of course, expanding into other countries including China where now we expect that we will be able to start enrollment this year in China [in IPF]. That's meaningfully important.

Michael Yee Jefferies LLC - Analyst

What about LAPC? That was never paused right? When would you complete enrollment there?

Enrique Conterno FibroGen, Inc. - CEO

So, once again, we haven't provided that. We intend to provide that timeline in the middle of the year, but that has not been paused. But we did see an impact as a result of COVID. We expect that as the pandemic will go to a somewhat new normal, that we will see a reacceleration.

We're also activating additional sites when it comes to LAPC. You correctly point out that we are looking at the resection rates as a surrogate for a meaningful clinical improvement. Because we know that with resection basically the likelihood of survival increases dramatically. We have a meaningful difference in the resection rate. We believe that we might be able to have accelerated approval for this product which would be very exciting.

Michael Yee Jefferies LLC - Analyst

Very good. I look forward to that data because that is important. And it's actually -- that shouldn't be a timeline long from completion to enrollment. Because obviously it's a rapidly progressing cancer. Enrique, thank you very much. We're on a tight schedule. You have a ton of other one-on-ones to get to. So, thank you for your time today. You look great and we look forward to the updates.

Enrique Conterno FibroGen, Inc. - CEO

Thank you so much, Michael.

Presentation

Operator

Good morning, and welcome to the 2020 Annual Meeting of Stockholders for FibroGen, Inc. I would now like to turn the conference over to Enrique Conterno, the CEO and Director of FibroGen. Please go ahead.

Enrique A. Conterno

CEO & Director

Thank you and good morning. I'm very happy to welcome everyone to the FibroGen 2020 Annual Meeting of Stockholders. At the request of the Chairperson of our Board, Jim Schoeneck, I will act as Chairman of this meeting. Normally, our annual meetings are held in person, but due to the COVID-19 pandemic, this year's annual stockholder meeting is being held online for the first time in a virtual telecast format to protect the health and well-being of our stockholders, Board of Directors and employees.

Since this is the first virtual annual meeting we have conducted, please bear with us if we encounter any technical issues. Before I call the meeting to order, I would like to take a moment to recognize and thank Dr. Toshinari Tamura for serving on our Board of Directors for 11 years. Dr. Tamura joined the Board following his tenure as a Senior Executive at Astellas, where he was instrumental in developing and managing the partnership with FibroGen. And he has provided outstanding counsel and guidance as a Director of FibroGen, in addition to his invaluable service as a member of our Scientific Advisory Board. As a partner, as a director and as an adviser, Dr. Tamura's contributions to FibroGen have been significant, and we are deeply appreciative. We thank him and wish him well.

I would like to introduce the members of the Board and Executive Committee management, who are with us today. All of our members of the Board are here today, Jim Schoeneck, Chairman of the Board; Suzanne Blaug, Jeffrey Edwards; Jeffrey Henderson; Dr. Maykin Ho, Thomas Kearns Jr., Dr. Kalevi Kurkijärvi, Gerald Lema, Rory Riggs; and Dr. Roberto Pedro Rosenkranz. The other officers of FibroGen here today are Pat Cotroneo, Chief Financial Officer; Rod Fuhriman, Vice President and Controller; and Michael Tung, Vice President, Investor Relations and Corporate Strategy. Please let me also introduce Michael Lowenstein, Chief Legal Officer, who will act as secretary and inspector of elections of this meeting. I would also like to introduce Greg Vlahos of PricewaterhouseCoopers, FibroGen's auditors, who is available to respond to appropriate questions.

Before turning to the formal business of the meeting, I would also like to mention some procedural matters that are different this year due to the online format of the stockholder meeting. First, there is an agenda outlining the components of this meeting, which should be visible in the top right corner of the online portal for this meeting. Second, the stockholders of FibroGen as of April 9, 2020, record date, are able to vote during this meeting, until we close the polls following the presentation of the proposals.

You may vote by clicking on the Vote Here button on the bottom-right portion of the website page for this meeting. If a stockholder has already voted online by telephone or mailing a physical proxy card, voting at this meeting is not necessary. However, a vote submitted at this meeting will supersede an earlier vote. Third, questions pertaining to the business of this meeting may be submitted by stockholders during the meeting in the Ask a Question Box, on bottom-left portion on the online portal for this meeting. [Operator Instructions] Fourth, we are recording this meeting, and you'll be able to replay the recording for 30 days from the website page for this meeting. Please wait a day or so after this meeting for the recording to be uploaded.

The meeting is now -- the time is now 8:06 Pacific time on Thursday, June 4, 2020, and meeting will now officially come to order.

We propose to proceed with a formal business of the meeting as set forth in your notice of annual meeting and proxy statements, and we will address questions pertaining to the business of today's meeting that are submitted through the online portal for this meeting. After the formal part of the meeting, I will give a brief update presentation on the company.

Will the secretary please report, at this time, with respect to the mailing of the notice of the meeting and the stockholders' list.

Michael D. Lowenstein

Chief Legal Officer

I have at this meeting a complete list of the stockholders of record of FibroGen's common stock on April 9, 2020, the record date for this meeting, and a list of the registered holders is available on the virtual meeting website. I also have with me an affidavit certifying that on or about April 23, 2020, a notice of Annual Meeting of Stockholders of FibroGen was sent to all stockholders of record as of the close of business on April 9, 2020.

Enrique A. Conterno

CEO & Director

Mr. Lowenstein has been appointed by the Board to act as inspector of elections at this meeting and has taken and subscribed the customary oath of office to execute his duties with strict impartiality, which will be filed with the records of the meeting. His function is to decide upon the qualifications of voters, accept their votes and to tally the final votes.

Will the secretary please report at this time with respect to the existence of a quorum?

Michael D. Lowenstein

Chief Legal Officer

Proxies have been received for 78,413,546 of the 89,068,759 shares of common stock outstanding on the record date, which represents approximately 88.03% of the total number of outstanding shares. This constitutes a quorum for the meeting today, and we may now carry out the official business of the meeting.

Enrique A. Conterno

CEO & Director

Very good. We will now proceed with the formal business of this meeting. There are 3 proposals to be considered by the stockholders at this meeting. The first item of business today is the election of our 4 Class III Director nominees, Thomas Kearns, Dr. Kalevi Kurkijärvi, Gerald Lema and myself, to the Board to hold office until the 2023 Annual Meeting of Stockholders or until their successors are elected.

The second item of business today is the approval on an advisory basis of the compensation of FibroGen's named executive officers as disclosed in the company's 2020 proxy statement.

The third item of business today the ratification of the selection of PricewaterhouseCoopers by the Audit Committee of the Board of Directors as the independent registered public accounting firm of FibroGen for the year ending December 31, 2020.

That was the final proposal for today's meeting. The secretary will now describe the voting procedures.

Michael D. Lowenstein

Chief Legal Officer

Each share of common stock is entitled to 1 vote. Voting is by proxy, telephone and mail prior to the annual meeting and by proxy online at www.virtualshareholdermeeting.com/fgen2020 during the annual meeting. You do not need to vote on the virtual meeting website if you have already voted your proxy online, by telephone or by mail. The time is now 8:11 and the polls are now closed for voting.

My report as inspector of elections covering the proposals presented at this meeting is as follows: the proposal to elect our Class III Director nominees, Enrique Conterno, Thomas F. Kearns Jr., Dr. Kalevi Kurkijärvi and Gerald Lema to the Board, is carried with each director receiving the votes of the holders of at least 94.5% of the shares voting.

The proposal to approve, on an advisory basis, the compensation of FibroGen's named Executive Officers as disclosed in the company's 2020 proxy statement has passed with 63,834,655 voting in favor; 816,731, opposed; and 127,652 abstaining.

The selection of PricewaterhouseCoopers by the Audit Committee of the Board of Directors as the independent registered public accounting firm of FibroGen for the year ending December 31, 2020, has been ratified with 77,823,779 voting in favor; 308,758, opposed; and 281,009, abstaining.

We expect to report our preliminary voting results, or if available to us on a timely basis, our final voting results on a current report on Form 8-K to be filed with the SEC within 4 business days after the end of this meeting. If not earlier reported, we expect to report our final voting results in an amendment to our Form 8-K within 4 business days after the final results are known to us.

Enrique A. Conterno

CEO & Director

This concludes the formal portion of today's meeting. We now adjourn the meeting before proceeding to the corporate presentation.

So I would like to wrap today's meeting with a brief presentation about company business. I would like to remind everyone that this presentation contains forward-looking statements that involve substantial risks and uncertainties. Including those described in the Risk Factors section of our most recent quarterly report on Form 10-Q.

Let's start with a brief company overview. First, it is important to reinforce our commitment to our mission, developing innovative, first-in-class medicine for the treatment of chronic and life-threatening or debilitating conditions. And our goal is to deliver value to both patients and shareholders. We have established 3 broad goals: first, ensuring the regulatory and commercial success of roxadustat, a transformational medicine in anemia therapy, first applied to treatments of patients with chronic kidney disease with significant potential for expansion into treatment of other anemias. Second, accelerating the development of pamrevlumab in our 3 high-value indications of idiopathic pulmonary fibrosis, locally advanced and resectable pancreatic cancer and Duchenne muscular dystrophy. And third, reenergizing our research agenda by delivering on our unique scientific expertise of both hypoxia-inducible factor, or HIF, and connective tissue growth factor, or CTGF biology to create a rich and broad pipeline of next-generation drug candidates.

Our financial position is strong with approximately \$600 million in cash at the end of the first quarter. We have a total of \$375 million in anticipated milestones expected through mid-2021, including the \$130 million in milestone for the European filing we just earned, plus \$245 million of milestones on U.S. and EU approvals and first commercial sale.

Based on our current forecast, we expect our estimated 2020 ending cash to be in the range of \$720 million to \$730 million, and we believe we're well financed for years to come.

Let me begin with roxadustat's first-in-class product program. In anemia associated with chronic kidney disease, or CKD, roxadustat was first launched in China. I will cover this exciting launch in more detail later in the presentation. Roxadustat has also been launched in Japan for the treatment of dialysis-dependent patients, and the supplemental new drug application for non-dialysis-dependent patient was submitted in January. In the U.S., the FDA is actively reviewing our roxadustat new drug application for both dialysis-dependent and non-dialysis-dependent patients and has set a PDUFA date of December 20, 2020.

In May, the roxadustat marketing authorization application for both dialysis-dependent and non-dialysis-dependent patients was accepted for review by the European Medicines Agency. Finally, there have been additional roxadustat submissions in a number of countries, including Canada, Mexico, Australia and South Korea, to name a few.

Beyond chronic kidney disease, our vision is for roxadustat to become the standard of care for anemia broadly. We continue to develop roxadustat for the treatment of anemia associated with myelodysplastic

syndrome, or MDS, which is in Phase III, and in chemotherapy-induced anemia, or CIA, which is in Phase II.

Moving now to pamrevlumab, our first-in-class antibody that inhibits the activity of connective tissue growth factor, or CTGF, a common factor in fibrotic and proliferative disorders.

First, on our important IPF program, given the recent COVID-19 pandemic, we had previously announced a pause in the enrollment of our ZEPHYRUS Phase III trial to ensure patient safety in this vulnerable population with compromised lung function. Working closely with clinical investigators of sites, we have now restarted enrollment of ZEPHYRUS and are on track to initiate ZEPHYRUS 2, our second pivotal Phase III trial in IPF later this year.

LAPIS, our ongoing Phase III trial in locally advanced and resectable pancreatic cancer, or LAPC, continues to enroll. Finally, we continue to prepare to initiate a Phase III trial, LELANTOS, evaluating pamrevlumab as a treatment for Duchenne muscular dystrophy, or DMD, in the third quarter of 2020.

As you can see from this slide, FibroGen has a robust late-stage pipeline. We are committed to accelerate in the development and rates of clinical trial enrollment across all of our programs. One of the areas that I have been impressed with joining FibroGen is the level of understanding that we have when it comes to both HIF and CTGF factor biology. If biology is involved in a number of different critical metabolic and regulatory processes in the body and provides unique opportunities to target a variety of diseases. Similarly, there are multiple potential application for CTGF biology in fibrosis and oncology.

FibroGen has one of, if not the largest, libraries of HIF and CTGF compounds allowing us to potentially target a plethora of therapeutic patients.

When speaking about research, the aim here is very clear. It is to develop new drug candidates to ensure and provide a sustainable stream of innovation based on these 2 scientific platforms. We will be providing more details on our earlier research programs, scientific agenda and development time lines in the second half of this year.

Now I would like to review roxadustat's highly differentiated efficacy. Roxadustat is the only HIF prolyl hydroxylase inhibitor to date to demonstrate superior efficacy versus epoetin alfa and placebo in the dialysis-dependent and non-dialysis-dependent patient populations' perspective. There is a direct correlation between hemoglobin level and the rate of red blood cells transfusion. And roxadustat has demonstrated a statistically significant reduction, the risk of transfusion in both that the dialysis-dependent and non-dialysis-dependent patient populations.

Clinical outcomes are extremely relevant to patients, physicians and payers. Additional benefits of roxadustat in the dialysis patient population include the fact that patients on roxadustat require less IV iron and roxadustat is effective in treating patients with inflammation.

Importantly, CV safety was demonstrated across all studied populations. Non-dialysis-dependent, incident dialysis and dialysis dependent. Today, I'd like to highlight the incident dialysis patient population. Let's start first with some definitions. Incident dialysis patients are those patients who are within 4 months of initiating dialysis for the first time. Time to -- the first major adverse cardiovascular event, or MACE, is a composite endpoints for all-cause mortality, myocardial infarction and stroke. And time to first MACE+ is a composite endpoint, which includes MACE events as well as unstable angina and heart failure requiring hospitalization.

In incident dialysis patients, roxadustat reduced risk of major adverse cardiovascular events or MACE by 30%. And reduce the risk of MACE+ by 34% compared to epoetin alfa. Both results were statistically significant. There was also a trend towards lower all-cause mortality relative to epoetin alfa. Roxadustat clearly provides a large clinical benefit in the incident dialysis patient population, and we believe this is a natural decision point for health care professional when selecting which therapeutic agent will be utilized in the treatment of anemia. This is highly relevant. As in the U.S., 86% of dialysis patients do not start today anemia therapy until the incident dialysis period. Said another way, only 14% of patients have been exposed to an ESA in the 12 months prior to initiating dialysis.

Some of you may have heard the term pipeline in a product. Next slide, please. And I think this slide illustrates the different anemias in which roxadustat could potentially play a role. We're well on our way to addressing the anemia of chronic kidney disease opportunity. But anemia associated with secondary chronic kidney disease, cancer and inflammation are all large unmet medical needs. We and our partners are committed to making roxadustat the standard of care when treating anemia regardless of the etiology of the disease, and this provides a good transition to the next slide.

FibroGen has in place 2 important roxadustat partnerships, 1 with AstraZeneca and 1 with Astellas. As of the end of the first quarter of 2020, FibroGen had received over \$1 billion total from these 2 partners since the start of the partnerships, made up of approximately \$750 million in upfront payments and approximately \$250 million in development and regulatory milestones. Still to come are approximately \$1.5 billion in outstanding potential milestones, \$375 million of which are expected by mid-2021.

This \$375 million in near-term milestones can be broken down into \$130 million on EMA submission, which we have just earned. And \$245 million on U.S. and EU approvals and first commercial sale.

In addition, we received our royalty and our transfer price in the low to mid-20% range in the U.S., Europe and rest of the world territories, except in China, where there is a 50-50 profit split.

Finally, we received full partner reimbursement for both the development and commercialization of roxadustat in all geographies, except in China. Where we share these expenses 50-50 with AstraZeneca.

Returning to China. As you know, the first regulatory approval for roxadustat was in China and roxadustat was included in the national drug reimbursement list, or NRDL, which went into effect at the beginning of the year. The launch is going very well. And in the first quarter of 2020, we reported \$5 million in net roxadustat revenues despite much of the country being locked down due to COVID-19. A key focus in China has been and continues to be expanding hospital listings, so the roxadustat can be widely prescribed. And the hospital where we are listed as of the end of Q1 represent 30% of the CKD anemia market opportunity, which is great progress. As we stand here today, we have seen a steady return to a new normal in China, and we expect a meaningful ramp in China roxadustat net revenues quarter-on-quarter.

China is the largest -- next slide, China is the largest dialysis market in the world. And there is an estimated 120 million people in China living with chronic kidney disease. In 2017, there was an estimated 600,000 patients in China on dialysis, but this patient population continues to grow rapidly. In addition, there are an estimated 1, up to 2 million dialysis stage patients who are not yet receiving dialysis treatment. We have seen meaningful adoption of roxadustat across a wide variety of patients segments and settings, including incident dialysis, stable dialysis, home dialysis, peritoneal dialysis and non-dialysis-dependent patients. This broad utilization is important because it informs us as to the different ways for roxadustat to potentially grow. The launch in China is going well, and we believe it has positive implications and read-through for the rest of the world. It gives us a lot of confidence for the role of roxadustat in both the non-dialysis-dependent and the dialysis-dependent patient populations.

Coming back to pamrevlumab. We are implementing a comprehensive plan to accelerate development across the 3 indications of idiopathic pulmonary fibrosis, locally advanced and resectable pancreatic cancer and Duchenne muscular dystrophy, once the situation with COVID-19 improves. Pivotal studies in all 3 indications will be enrolling this year, and we intend to give a more fulsome update on clinical trial status and time lines in the second half of this year. We also recently announced that we are planning clinical trials of pamrevlumab in the treatment of COVID-19. Given our expertise in CTGF biology and its potential application in lung disease, we have a unique approach with pamrevlumab in the treatment of patients suffering from severe pulmonary sequelae of the virus -- of coronavirus. These trials will determine if pamrevlumab treatment of hospitalized COVID-19 patients improves patient outcomes, both during the acute phase of infection and longer term.

Finally, these are upcoming -- these are the upcoming milestones for the remainder of the year. We look forward to publishing additional roxadustat data from our Phase III studies, including post analysis, and are expecting roxadustat approval in the U.S. by year-end.

Thank you very much for joining us for the meeting and for this brief presentation. Thank you.

Operator

Ladies and gentlemen, this does conclude the program, and you may all disconnect. Everyone, have a great day.

Kyuwon ChoiGoldman Sachs Group Inc.,
Research Division

Presentation

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Okay. Good afternoon, one. I'm Paul Choi, the SMid cap biotechnology analyst at Goldman Sachs. We'll continue with our next session here, which is FibroGen. And I'm very pleased to introduce from management, Enrique Conterno, who's, I think, a well-known quantity to investors. He's the CEO here at FibroGen.

I think as with other sessions, what we'll do is let Enrique do a few brief introductory remarks and give us an overview of what he's finding to be going on at FibroGen. And then we'll proceed with the Q&A. [Operator Instructions] And with that, Enrique, I'll turn it over to you for some opening comments.

Enrique A. Conterno

CEO & Director

Very good, Paul. Thank you very much for the invitation. It's a pleasure to be here.

I'm very excited with the agenda that we have at FibroGen. As I've mentioned in the past, we are very committed to 3 overarching goals. #1 is to ensure that regulatory and commercial success of roxadustat, and we are making excellent progress. I'm pleased with how the regulatory review is going. And also, I think it is important as -- when we look at the profile and some of our competitors starting to get some of the data basically reinforcing that we have a highly differentiated product profile in roxadustat, and we can speak a little more about that.

Second, overall objective is about accelerating the development of pamrevlumab. Of course we've been pursuing IPF. We are pursuing locally advanced and unresectable pancreatic cancer and finally we intend to start Phase 3 trial for Duchenne Muscular Dystrophy in the second half of this year. Three important indications that we have been discussing for quite some time. We had announced that we had paused the IPF studies, we paused that for a couple of months, but we have now restarted enrollment of the IPF studies. We paused it due to vulnerability of those patients to COVID-19 given their vulnerability when it comes to pulmonary function. And of course in DMD we are going to be starting, we believe, in the second half as I mentioned. Now in addition to those three important trials we announced yesterday that we are also starting trials in COVID and it is important just to give maybe a sense of how we are thinking about this. There are two main areas of COVID that we are studying. All of them in hospitalized patients. But one area is in the acute settings, where patients we believe that pamrevlumab can help with oxygenization so at the end patients should require less ventilators and basically really better survival over all. And then I think probably more evident than that is on the chronic side that we think about the patients that develop post being hospitalized and plus having COVID basically develop interstitial lung disease and they have fibrosis and we clearly given the data that we have from IPF, we view we have a very unique and important approach to try and ameliorate this fibrosis in those patients. So we clearly have a very interesting trial as well when it comes to that second setting. And finally the third overarching objective is to really reenergize our research agenda and bring new clinical candidates and bring new products. Really leveraging the scientific platforms that we have both around HIF biology and CTGF biology. So it is very exciting and we are planning to share more of that I think during an Analyst Day that we are planning to hold sometime in Q3 or Q4.

Question and Answer

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Great. Thanks for that overview, Enrique. Maybe we will start with the commercial piece because roxadustat is approved in certain international markets, specifically in China and Japan. Can you maybe give us a sense of what the commercial environment is like for you and your partner post-COVID and you know sort of what's happening in the China market- probably is most of interest to investors. And just has there been any inflection in recent weeks as China has been opening up?

Enrique A. Conterno

CEO & Director

Yes. I think as I've mentioned, we feel very good about our China launch. Just to recap, we had 5 million dollars of sales in net product sales of roxadustat in Q1. Keep in mind that Q1 has 2 months' worth of lock down in China, two out of three in the quarter. So in a certain way I think April was really the first month when we started to see basically China starting to return to a new normal. We have seen an important inflection on demand in China. Of course, I think we had talked about the listings and how much progress we are making on the listings. Which, at the end of Q1 we had shared that we were already accessing, based on hospital listings, over 30% of the overall market for CKD anemia in China both across DD and NDD. And those listings continue to improve, so what we shared in the Q1 earnings call was basically that we expect a meaningful ramp-up in revenue as we look at Q2 and beyond. So we are very excited and think I would qualify the launch as going very well.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Okay. And by the way, I'm just getting some comments that maybe the audio and visual might be having a little bit of issues. So I do want the audience to know that we are working on it and hopefully Enrique's comments, which are more important than my questions are coming through. If something is not clear, please just let me know and I'll try to reiterate or summarize what Enrique is saying here. Then maybe just to follow up on the China side with regard to the NRDL, has that-how is that, in your view now that you are officially on the NRDL, change the market opportunity for you? It does effect the price in terms of downward pressure, but in terms of access, how does that change the dynamic for roxa there?

Enrique A. Conterno

CEO & Director

Well, as you know, I think NRDL's really for products in China -- really for the -- really, the launch of products in China that is really when you can have meaningful uptake for our products and when you can have meaningful listings. And we are very pleased with the price that we received. And at this point in time, it's -- the key objective for us is really to improve the number of hospitals where we're listed, and we are doing that at record pace. I'd like to compliment our partner, AstraZeneca, which is a force in China, in doing a terrific job. And we're seeing adoption in those hospitals. So we are basically seeing many of the pillars basically working.

One thing that is encouraging for me to look at China beyond the number of patients. So for us, is to look at the different types of patients that we're enrolling. It's not just generally DD and NDD. I had expected maybe the NDD uptake to be maybe slower, but we are seeing good uptake in NDD. And when it comes to dialysis, we're seeing home dialysis, we're seeing incident dialysis. We're seeing patients that were on prevalent dialysis. So it's -- we are seeing basically many different types of patients, which gives me a confidence that we have many ways of growing over time, which I think is very encouraging for us.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Great. And maybe the last question on China, and you touched on it. You're seeing mixed use in terms of the different populations as you indicated. Just in terms of how patients are responding to it and potential stickiness and adherence to therapy, I know it's early days, but could you maybe provide some color on this? Is this something that they're just maybe trialing for the near term? Or what is the adherence looking like, at least in the early days here?

Enrique A. Conterno

CEO & Director

I think it's a little bit too early to look at the adherence. But as you know, that is going to be key for roxadustat. Hopefully, a benefit that we can provide over other therapies, given its oral use and the overall efficacy safety profile, So that's something that is part of our agenda to ensure that patients are adhering so they can get a full benefit of the product. But it's a little bit too early to comment on what the adherence is.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Okay. Great. Thanks. Understood. Maybe shifting gears then. You talked a little bit about competitor data here that's recently emerged. And you saw some competing data from another drug in the HIF category here. And we're also probably in a time frame where we could see some incremental updates in a different population. So I think you probably understand that we're talking about Akebia's data here. And so could you maybe provide your initial thoughts on what you saw with the dialysis population here? What does that mean perhaps from a competitive perspective for FibroGen here?

Enrique A. Conterno

CEO & Director

Yes. I think the data from the competitor validates the class, but it also reinforces the highly differentiated medicine that we have in roxadustat. And maybe I wanted to make a few comments on that. As I think about efficacy, which is so key, as you know we had with roxadustat, a statistical superiority on hemoglobin relative to EPO in DD. And when we look at the data of our competitor, yes, they were non-inferior clinically, but really -- relative to darbepoetin, but statistically inferior when you look at the results. Our hemoglobin mean was 10.86. Their hemoglobin mean was 10.36 -- sorry, 10.85 for us, 10.36 for them.

Now keep in mind and as you know, hemoglobin levels are related to transfusion. So the higher your hemoglobin in that 10 to 12 range, the lower risk of transfusion that you have. And we demonstrated a statistically significant reduction in transfusion relative to EPO.

It's also important to note that the cohort of patients on hemoglobin, 8 to 10 have about a three- to fivefold increase in the risk of transfusions relative to 10 to 12. And the standard deviation was a little bit above 1, I think, for the competitor product. For us, it was just slightly less than 1. So think about 10.36, standard deviation of 1, how many patients you have below 10. Think about our product, and therefore what is the real outcomes when it comes to efficacy.

Now in addition to that I think as you know, I've been very excited about our incident dialysis data and the fact that we showed a 30% reduction in MACE risk and 34% when it comes to MACE plus. Honestly, that's huge and that's an anchor. Because as patients start dialysis, clearly part of that dialysis initiation is going to be treatment of anemia. And I believe that we have the very best data. It's quite compelling and differentiated.

So I feel like we probably have the best of both worlds, validation of the class, but also a differentiated product.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Would your expectations for the upcoming competing data in non-dialysis-dependent population be any different here? Do you think the trial will succeed? Given your earlier comments on the class validation, is

there any reason to think it wouldn't work? Or are you looking primarily for differences on the periphery here as you highlighted with the dialysis population?

Enrique A. Conterno

CEO & Director

Yes. Let's wait for the data. Let's -- and I'll comment on the data once I see it, so I can comment, not speculate on it.

Kvuwon Choi

Goldman Sachs Group Inc., Research Division

Fair enough.

Enrique A. Conterno

CEO & Director

But I -- as you know, there's a difference in trial design in that we compare [ourself] to placebo, which I think gives us the very best chance to basically have a label without a black box, given that we showed basically comparable safety to placebo. It is very difficult to achieve that -- if the trial is designed with a comparator relative to a product that has a black box. Clearly that, from a regulatory perspective, really doesn't fly. So I also like our chances to get the very best possible label here.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Great. That's actually kind of related to an inbound question we received from an investor, if you don't mind. And just in terms of -- you talked about comparators. And is a placebo comparator, in your mind, a higher bar as you think about the regulatory process than comparing to EPO?

Enrique A. Conterno

CEO & Director

It is when it comes to safety, of course. And at the end, I think EPO have a black box, so ESAs has black box. So it is a much higher bar, right? So if you compare yourself to a black box, as you know we just released data from DOLOMITES yesterday. And as part of the data, we had a -- yes, very good efficacy, noninferior but as favorable on the efficacy side to darbepoetin, but the hazard ratio on CV was of course not a large number of events, but it was 0.81 for MACE and 0.9 for MACE plus. So I think it reinforces the profile. But regardless of what that result would be, if all of our trials were compared to ESAS, I think it will be extremely difficult to avoid a black box. So I do think it's a high hurdle. Keep in mind also that most patients in that setting are really not receiving an anemia treatment. One statistic that I've shared in the past is that when you look at the 12 months prior to initiating dialysis. So these are patients before going to the 12 months prior, only 14% of them are on a ESA treatment in the United States. That's a very low number. So I think what that tells me is there's a huge opportunity to increase the treatment rates, not just in the 12 months, but we're going to be looking at stages 3 to 5 and making sure that everybody is really receiving the proper standard of care and treating anemia when appropriate. And I think that's a very important opportunity for us. And quite frankly, I think we're offering a product now that is going to be -- has a safety profile that doe not exist in NDD. So I think the possibilities are very significant for us.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Great. So maybe sticking on the topic of data. You mentioned DOLOMITES. But maybe if we could go back a few months to ASN meeting last year, you presented some detailed data across your studies. But one of the questions, I think, that remains on the mind of investors is just given what you presented at ASN, what is your current thinking on a potential advisory committee meeting for roxa later this year? Especially it got a little trickier given the FDA is operating in a COVID environment. And just maybe do you expect a meeting? Is that going to happen? And just where are you in terms of preparation for that?

Enrique A. Conterno

CEO & Director

As we've shared in the past, we have received no indication from the FDA of an Adcom. Typically, sponsors -- the FDA shares with the sponsors that they should plan for an Adcom, either prior to submission or during filing acceptance. We are having our mid-cycle review later this month. That is, we can call it almost the last opportunity for the FDA to say, hey, we're going to plan. It will be very late, but it could be a time when the FDA could say we -- they want to look at that. Clearly, after that data I think the chance of an Adcom, I think, decreases exponentially. So I -- at this point in time, nothing has changed. We feel very good about our data. I think I remember the first time we met and I shared with you, I found the data very compelling on the CV side as well. On the CV safety side, one is comparable or relative to placebo and NDD when the alternative today basically has a black box. So that's a great scenario. And relative to EPO in DD, in incident dialysis where there are so many risks for CV events, we basically have a 30% reduction in MACE. That's an unbelievable result. So I find the data very compelling, and I don't believe the CV data -- safety data warrants a black box.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Okay. Thanks for that, Enrique. Maybe digging into the data a little deeper that you presented. In terms of the MACE end point that you referenced, in all 3 populations, it was below the historical 1.3 standard that's typically been used in this sort of population. But some of the individual components were above that. And can you -- you said your mid-cycle review meeting is coming up here. But I guess, what's your -- the company's perspective on when thinking about the composite end point and how the agency might view that, versus some of the individual components that did show somewhat higher upper bounds with regard to the confidence intervals?

Enrique A. Conterno

CEO & Director

Well, the higher bounds for the subcomponents, including some that are below 1, the ones that are below 1 is because you have a smaller sample size. That's just a function of the sample size. Clearly, you design the trial and the sample size to be able to meet a certain -- to be able to rule out a certain level of excess risk, okay, in this case I think 1.3 or 30% excess risk.

Typically, what the FDA will look at is they will look at MACE, and they will basically look at the entire pool, which is for DD and for NDD and look at the benefit/risk profile of the product. I feel like -- I feel that we have with roxadustat, we have a very favorable benefit/risk profile.

When it comes to the sub-endpoints, when it comes to whether it's death or MI or stroke, I -- what FDA is looking at is whether any of those sub-endpoints basically are statistically significant when it comes to harm. So -- but in all of the cases for our studies and the pooled analysis for both DD and NDD, the confidence interval actually includes 1. So we don't have that issue. But that could be, even though the study is not powered to do that, that could be a question that the FDA has if you have one of the subcomponents to basically have the entire confidence interval to the right of 1, if you wish. That's not our case.

So in a certain way when I look at the interim data, I think as I look at principles as I've -- as you know, I had a chance to run CV studies in my previous roles. I basically feel like we meet a number of different filters that make me feel very confident about the strength of the data from a commercial safety and a regulatory perspective.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Okay. That makes sense. Maybe just to talk a little bit about one of the populations that that gets a little bit overlooked relative to dialysis or non-dialysis, that's the incident dialysis population. And as a reminder for investors, this is a population that has had basically minimal exposure historically to EPO or very limited exposure. And in terms of the trial, this is the one subgroup or the one population that didn't show an improvement on MACE here. Is this also, Enrique, an artifact of the trial sizing and design? And maybe

more from a commercial perspective and regulatory perspective, how are you approaching the opportunity in this particular population?

Enrique A. Conterno

CEO & Director

Yes. So as you said, I think we showed a significant benefit when it comes to MACE in this population, 30% reduction in MACE. Just for your audience, incident dialysis is basically we enroll patients that basically were starting dialysis, the definition is within the first months of starting dialysis to be enrolled in this particular trial. And we had 1,500 patients in this trial, so a fair amount of patients. And what we -- as you know, these patients are at significant risk because of the transition. It is one of the riskier times for patients. And I think the results are quite compelling. Unfortunately, as you know survival with dialysis is not good. So patients after 5 years don't have a great chance of survival in some cases. So giving them the best chance by whenever they start dialysis to have -- to basically be on a treatment that has such compelling MACE results, I think is incredibly important. So I feel it is the natural point when the treatment decision for anemia will be made starting dialysis and where we have probably the most compelling data that we have.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Okay, interesting, right. Maybe continuing on the commercial front here, Enrique. In terms of the U.S. market, it's -- in terms of dialysis providers, it's essentially a duopoly dominated by 2 companies, specifically DaVita and Fresenius. Can you maybe comment on what's been happening with regard to your discussions with these potential providers? What is the feedback been on the roxa data, and perhaps how are they thinking about implementing or integrating roxa into their treatment paradigms there?

Enrique A. Conterno

CEO & Director

Clearly, as you can imagine first, we have close relationships with dialysis organizations, the 2 large ones you mentioned and others as well. Clearly, we've been working with them because we run our clinical trials and they were part of that. And clearly we are in discussions, thinking about how to ensure once we get approval, that we can have the most success incorporating roxadustat into different protocols. Clearly, that's a decision that each one of those dialysis organization will have to make.

A pretty important part of that decision-making process is reimbursement. And as you know, we have a framework from CMS called TDAPA, which is basically the add-on payments for products that bring innovation and that in order to basically create an incentive for dialysis organizations to include these products into their protocols, given that they have a bundle that is capitated, they are going to be providing this add-on payment. This add-on payment is 100% of the ASP, or average selling price, and we believe that roxadustat is eligible. The process for this to happen is you once you get approval, you apply for this, then you would basically get authorized for -- to be included in TDAPA. We believe that roxadustat is eligible, and we intend to apply for it.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Great. So just to remind audience who may be listening here, this TDAPA technology innovation premium that you referenced would be incremental to the fixed bundle that these centers currently get for treatment and for drug. That's correct?

Enrique A. Conterno

CEO & Director

That is correct.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Okay. Great. So one of the things, I guess, in terms of your last steps here is as you think about commercialization here and the footprint in the U.S. is thinking about the competitive landscape and ultimately perhaps pricing. You've obviously mentioned that you're talking about your discussions with some of the larger dialysis providers here. But how does pricing in the U.S. perhaps potentially look like in your mind relative to what it's been established in terms of your existing commercial markets like China and Japan? And then how do you think potentially about what the commercial landscape might look like in Europe where your partners are also seeking approval for roxa?

Enrique A. Conterno

CEO & Director

Yes. It's an excellent question. Clearly, we want to make sure that we are pricing our products relative to the value, a significant value that the product can provide. We won't be discussing specific pricing strategy as you can imagine, until basically we launch the product, we don't think that will be in our best interest to disclose that now. But we need to ensure when we look at the U.S., that we are looking at all the benefits that the product basically provides and from a clinical and from an economic perspective to the system. And then making sure that we are pricing the product appropriately to what it offers. Clearly, when it comes to different settings or different markets in Europe for example, Europe in many markets -- most markets in Europe, they tend to anchor to a specific price. Which is why in Europe, you typically need a trial like DOLOMITES, for example, that allows you to basically bridge from the anchor price, maybe from an ESA and how do you bridge that to a price for in this particular case for roxadustat. So you still do the formal economic analysis, but the process is a little more rigid, I think, than in the U.S.

I'm excited about, honestly how transformational this product could be when it comes to the treatment of anemia, first in CKD of course. But keep in mind that we're also pursuing other indications, 2 that we have shared in chemo-induced anemia and also MDS. So very exciting opportunity for us to really revolutionize the treatment of anemia.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Sure. That actually provides a nice segue to talk about these additional opportunities for roxa. Obviously, investor focus has largely been in the past year or so on regulatory landscape. But you are also running an ongoing Phase III in MDS, and you've published some very interesting data there. Can you maybe talk about what is the next potential update for the MDS study? What is the enrollment status right now?

And then in terms of the competitive landscape, there's a drug approved out there for treating anemia for MDS related patients. Can you maybe just think about how clinicians might view roxa in this population, given that there is an approved therapy out there for patients with anemia who have MDS?

Enrique A. Conterno

CEO & Director

Yes. Clearly, it's -- as you know, this is a highly vulnerable population, and we are delighted with the progress that we're making. I think through the COVID-19 epidemic, I think we've continued to see good progress in the enrollment of our Phase III study in MDS. There is indeed a therapy approved, but keep in mind that this is -- they have a much narrower label. It's really for ring positive and really as a second line to patients that have failed on ESAs. And our study really looks at both ring positive and negative and whether they are naive to ESAs or failed on ESAs. So we probably have a population segment that is probably 3x as large as the current approved therapy. So we're excited about that trial and what -- looking at our results, we should be able to see something on that trial sometime next year.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Next year on that. Great. And then you also referenced what could also potentially be a very broad population as well, which is chemotherapy-induced anemias. I think that's also something like MDS that gets overlooked a little bit there. Can you maybe give us an update on what are your plans there? You

obviously have your plate full with roxa in dialysis and your regulatory situation, but you have the Phase III going on in MDS. What's the plan to sort of expand the opportunity set here with CIA?

Enrique A. Conterno

CEO & Director

So CIA as you know, we're in Phase II. We'd like to conclude as soon as possible and then enter Phase III. Keep in mind that we have around 1.3 million patients with chemo in the U.S. And depending on the area, you could be looking at rates of anemia between 30% and 90%. So there is a very significant need when it comes to chemo. So we are trying to make as much product as we can as fast as we can because we think that this opportunity is very meaningful.

Keep in mind that ESAs used to sell almost \$4 billion in this segment back in the mid-2000s. So they had a very significant use in this setting. And when you look at blood transfusions in the United States, about 15% of the blood transfusion are in heme-oncology, so hematology-oncology. That's -- it's -- there's a very significant need, and I believe that we can also play an important role.

Kvuwon Choi

Goldman Sachs Group Inc., Research Division

Okay. Thanks for that. So maybe sticking with the pipeline here and switching gears to pamrevlumab. I think the program that you talked about earlier in IPF, it was on pause. And you talked about it resuming here, but you're also planning a second trial. So I was wondering, can you maybe comment on when that second trial might potentially kick off here? And just what are sort of -- what does enrollment look like for the first trial now that you resumed that? And then maybe we can talk about the commercial opportunity after that as well.

Enrique A. Conterno

CEO & Director

Yes. So one of the reasons we're excited about pamrevlumab is because when we look at the Phase II results, which were published in the Lancet, we see an effect size on forced vital capacity that is basically larger than products that are today standard of care or any product that I can see in development. So we have once again a very differentiated product on the efficacy side and it's highly tolerable.

In addition to that, it is really the only product that in IPF that when you look at imaging, you basically can see reversal of fibrosis. So it's a very exciting profile. Keep in mind that the Phase III trial was designed in such a way that it is very close to the Phase II, which I think always increases the likelihood of success.

We're going to be providing a full update on the time lines for this trial and others on pamrevlumab during our Analyst Day in Q3 or Q4. So we look forward to that. I think what I would say is clearly when you look at enrollment, one of the most important things for enrollment is site activation. We are making great progress in site activation. One of the things we've done is geographic expansion of where we are enrolling patients. So in Asia whether it's Korea or Taiwan or in Europe, but also we intend to start enrolling patients in China likely in Q3 of this year. So we -- with that geographic expansion, it allows us to activate many more sites and really accelerate the enrollment in a really big way. So I'm excited about our plans to bring the therapy to patients as soon as possible.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Great. And you talked a little bit about the patient population here. And so I think you were probably referring to Esbriet, which is the approved therapy in the indication. But can you maybe remind us, are the trials designed to be a second-line therapy? Is this supposed to be something that would displace it in the front line? How do you think about the target population ultimately for pamrev here in IPF?

Enrique A. Conterno

CEO & Director

Yes. In ZEPHYRUS 1, we are enrolling patients that are naive to therapy and patients that have failed the standard of care. As you know, only less than half of the patients really are able to be on the standard of care for a number of different reasons, including tolerability reasons. So the idea with this product is to truly -- if we can show results not only when it comes to forced vital capacity where we can have the largest effect size of any product when it comes to pulmonary function, but if we can also look at some measures when it comes to disease progression and the fact that we can have a significant impact there, I think this product could be pretty transformational. And I believe that the product, yes, in some cases, is going to be used with other products or -- but in many cases, why not utilize this product as your firstline product? It's all going to depend on at the end, on the Phase III trials. But if they replicate -- if we replicate what we saw in Phase II, I think our chance to become standard of care, first line, are very significant.

Kyuwon Choi

Goldman Sachs Group Inc., Research Division

Okay. We're pushing our timing here. But Enrique, I want to maybe spend a little bit of time talking about strategy here and particularly with regard to the third leg or aspect of the story. You talked about particularly with regard to investing in discovery and research here. And just -- you have you a pretty full plate right now with roxa in 3 indications and then developing pamrevlumab for 3 indications. But just at what point do you think about reinvesting in the business, emphasizing discovery again and just maybe potentially adding a third leg to the story here?

Enrique A. Conterno

CEO & Director

Yes. We are really putting a lot of focus on that area. Of course, that today is not visible to investors, but I find very significant opportunities to basically develop -- to think about HIF biology and develop new compounds. They're not necessarily going to be HIF-PHIs, okay? So I think there are many opportunities for us. But if you look at whether it's preclinical models or you just look at the underlying biology of the HIF class, it is pretty clear that you could be impacting many different diseases or disorders. And it's very exciting for us to think about that. I would disclose some more during our Analyst Day, probably not enough to -- for you to say, wow, exactly, tell me more, but enough to maybe whet your appetite of how exciting this area is and all the different opportunities or the reasons to believe.

And I think similarly for CTGF biology, of course we have pamrevlumab. We could think about what additional indications we could pursue with that asset. But also we need to be thinking about how do we leverage CTGF biology to develop new clinical compounds and being able to bring the next leg of this -our innovation story to patients. So I'm very excited about that. I think it's very promising.

Kvuwon Choi

Goldman Sachs Group Inc., Research Division

Great. It sounds like the Analyst Day or R&D Day coming up here will be really interesting for multiple reasons. Unfortunately, we've come up here on our time limit. Enrique, thank you so much for participating again in the GS conference, and we'll see you again soon.

Enrique A. Conterno

CEO & Director

Thank you very much, Paul.

Kvuwon Choi

Goldman Sachs Group Inc., Research Division Okay, thank you.

Presentation

Michael Tung

Investor Relations Executive

Thank you, Ashley, and good afternoon, everyone. I'm Michael Tung, Vice President of Corporate Strategy and Investor Relations at FibroGen. Joining me on today's call are Enrique Conterno, our Chief Executive Officer; Thane Wettig, our Chief Commercial Officer; Pat Cotroneo, our Chief Financial Officer; Dr. Peony Yu, our Chief Medical Officer; Chris Chung, our Senior Vice President of China Operations; and Dr. Elias Kouchakji, our Senior Vice President of Clinical Development, Drug Safety and Pharmacovigilance. The format for today's call includes prepared remarks from Enrique and Pat. After which, we will open up the call for Q&A.

I would like to remind you that remarks made on today's call include forward-looking statements about FibroGen. Such statements may include, but are not limited to, our collaborations with AstraZeneca and Astellas; financial guidance; the initiation, enrollment, design, conduct and results of clinical trials; our regulatory strategies and potential regulatory results; our research and development activities; commercial results and results of operations; risks related to our business; and certain other business matters. Each forward-looking statement is subject to risks and uncertainties that could cause actual results and events to differ materially from those projected in that statement. For a more complete description of these and other material risks can be found in FibroGen's filings with the SEC, including its most recent Form 10-K and Form 10-Q. FibroGen does not undertake any obligation to update publicly any forward-looking statements, whether as a result of new information, future events or otherwise. The press release reporting our financial results and business update and a webcast of today's conference call can be found on the Investors section of FibroGen's website at www.fibrogen.com.

And with that, I would like to turn the call over to Enrique Conterno, our CEO. Enrique?

Enrique A. Conterno

CEO & Director

Thank you, Mike. Good afternoon, everyone, and welcome to our second quarter 2020 earnings call. Despite the challenges presented by the COVID-19 pandemic, on behalf of FibroGen, I'd like to reassure patients, health care providers, investigators and stakeholders of our continued commitment to bring our potential first-in-class medicines to patients suffering from chronic and life-threatening conditions. We continue to monitor the situation closely. To our employees and our patients and to the health care providers, regulators and countless others who interact with FibroGen, please know our thoughts are you and your families.

I want take a moment to welcome both Dr. Aoife Brennan and Dr. Ben Cravatt to our Board of Directors at this exciting point in Fibrogen's history. Aoife's experience in rare diseases and clinical development and Ben's world-class expertise in biology and chemistry will provide invaluable perspective to our Board.

With today's earnings call, we are implementing a new format with a goal to improving communications with the investment community and other stakeholders. I will begin by providing a high-level summary of the most important accomplishments and developments from the second quarter. Pat Cotroneo, our CFO, will then review the financials. After which, we will open up the call to your questions. Today's updates will include our China results, U.S. regulatory review and our clinical trials. We hope this new format will result in more time for us to have a constructive dialogue.

So let us get started with our strong China results. With a return to a new normal business environment in China, we are pleased to report net sales of roxadustat of \$15.7 million for the second quarter. This represents an increase from the \$5 million in China net sales reported the first quarter. We are most encouraged by the trajectory of the launch, which is being driven by both an expansion in hospital listings and continued adoption. Hospital listings continue to be a key focus of our launch efforts. Notably, as of the end of the second quarter, roxadustat was listed as hospitals representing over 45% of the CKD anemia market opportunity in China. This is in comparison to the over 30% reported at the end of the

first quarter. We're especially pleased with the penetration at top-tier Class IIIA institutions, which are generally the larger ones and the hospitals were key opinion leaders and early adopters practice.

We continue to see broad roxadustat utilization across different patient populations, including in the hemodialysis, peritoneal dialysis and non-dialysis populations. Utilization across these different patient populations bodes well for long-term success and provides important learnings as we prepare to launch roxadustat in the U.S. and other countries.

Finally, we recently amended our China collaboration with AstraZeneca. The new agreement more optimally aligns both FibroGen and AstraZeneca to maximize the economic value of the roxadustat franchise and will result in improved and more predictable economics and profitability for FibroGen. We look forward to keeping you updated as we advanced our long-term goal of making roxadustat the standard of care in treating China's CKD anemia patients.

Let us turn now to the U.S. regulatory review and commercial preparation for roxadustat. We had our mid-cycle review with the FDA in June and continue to expect an FDA decision on the roxadustat NDA by the PDUFA date of December 20, 2020. The FDA has indicated that an advisory committee meeting is not planned at this time. Overall, we are pleased with the cadence of an engagement with the FDA. While future interaction with the FDA are planned, given the proximity of label discussions, we will no longer be commenting on those interactions until the PDUFA date. On the commercial front, we appointed Thane Wettig to the newly created position of Chief Commercial Officer, where he will lead FibroGen's commercialization efforts. Thane brings more than 30 years of global biopharmaceutical leadership and experience, and we welcome his leadership in this area. Thane is working closely with our partners, AstraZeneca and Astellas, to ensure roxadustat will reach as many CKD anemia patients as possible on a worldwide basis.

We continue to work closely with AstraZeneca regarding U.S. launch preparation activities. Within the next few months, we expect to have submitted up to 10 manuscripts covering the Phase III data, both individual trial and pooled data sets. At the upcoming American Society of Nephrology Congress in October, we expect to present a meaningful number of abstracts on roxadustat and HIF-PHI science. We continue to engage with CMS on the Transitional Drug Add-on Payment Adjustment, or TDAPA. Finally, disease awareness activities imperative to reframing the primary defect of CKD anemia from one of EPO and iron deficiency to an oxygen-sensing deficit are under way in the U.S.

In Europe, the filing for roxadustat for the treatment of anemia in adult patients with chronic kidney disease was accepted by the European Medicines Agency in May. Our partner, Astellas, expects a European approval decision mid-2021.

Moving now to our pipeline, starting with newly initiated clinical trials. In June, we initiated 2 separate trials studying pamrevlumab in patients hospitalized with COVID-19. In the U.S., we initiated a Phase II study investigating the efficacy and safety of pamrevlumab in hospitalized patients with acute coronavirus infection. This multicenter trial will enroll approximately 130 patients with COVID-19 and will assess patient time to and on ventilatory support.

In Italy, a Phase II/III investigator-initiated trial investigating the efficacy and safety of pamrevlumab in approximately 68 patients hospitalized with COVID-19 was started. The primary objective of this study is to assess the effect of pamrevlumab on blood oxygenation in patients with COVID-19 infection in the acute and post-acute settings. The majority of patients suffering from severe forms of COVID-19 have bilateral interstitial pneumonia-causing reduction in oxygenation and severe respiratory failure. The administration of our anti-CTGF antibody, pamrevlumab, could protect the lung from the immediate consequences of the infection presented as acute respiratory distress syndrome.

Now moving to an update of our ongoing clinical trials. The COVID-19 pandemic continues to present challenges to the conduct of clinical trials across our industry. The most effective of our trial continues to be pamrevlumab's ZEPHYRUS IPF trial in which we temporarily paused enrollment for 2 months due to the vulnerability of this patient with severely compromised lung function. We have reopened ZEPHYRUS for enrollment and the remainders of our studies in locally advanced and resectable pancreatic cancer, myelodysplastic syndrome and chemotherapy-induced anemia continue enrollment, albeit at slower rates.

We expect to initiate LELANTOS, a Phase III trial of pamrevlumab in patients with non-ambulatory Duchenne muscular dystrophy this quarter, and we plan to publish updated 2-year data from a recently completed Phase II DMD study before year-end. We remain focused on accelerating enrollment of all of our ongoing clinical trials while ensuring patient safety.

I will now turn the call over to Pat Cotroneo, our CFO, to review the financials. Pat?

Pat Cotroneo

Chief Financial Officer

Thank you, Enrique. As announced today, total revenue for the second quarter of 2020 was \$42.9 million as compared to \$191.6 million for the second quarter of 2019. The current quarter revenue consists of net product revenues of \$15.7 million for roxadustat sales in China, \$19 million in development revenue and \$8.2 million of API sales in Japan. For the same period, operating costs and expenses were \$128 million and net loss was \$85.3 million or \$0.95 per basic and diluted share as compared to operating costs and expenses of \$78.7 million and a net income of \$116 million or \$1.34 per basic and \$1.26 per diluted share for the second quarter last year. Included in operating costs and expenses for the quarter ended June 30, 2020, was an aggregate noncash portion totaling \$23.6 million, of which \$17.6 million was a result of stock-based compensation expense as compared to an aggregate noncash portion of \$21.9 million, of which \$17.6 million was a result of stock-based compensation expense for the same period in the prior year.

At June 30, FibroGen had \$716 million in cash, cash equivalents, restricted time deposits, investments and receivables. During the second quarter of 2020, we received \$50 million for a milestone payment from AstraZeneca relating to the FDA's acceptance of our U.S. NDA filing and \$130 million of milestone payments from Astellas in connection with the EU MAA filing. Both of these milestones were recognized as revenue in the prior year when achievement became probable. Based on these milestone payments and our latest forecast data, we continue to estimate our 2020 ending balance of cash, cash equivalents, restricted time deposits, investments and receivables to be in the range of \$720 million to \$730 million, assuming U.S. NDA approval in Q4 2020.

Looking ahead, we have a total of \$245 million in anticipated milestones expected over the next 12 months for anticipated U.S. and EU approvals and first commercial sale in the U.S. At this point in time, we have no changes in our expectations in any of the anticipated milestones over the next 12 months. Thank you.

And I would now like to turn the call back over to Enrique.

Enrique A. Conterno

CEO & Director

Very good. Thank you, Pat. And in summary, FibroGen is well positioned. Our business continuity plans are in effect. And while we're seeing some impact to our operations resulting from COVID-19, we have the capabilities and resources to navigate through these uncertain times and achieve our stated goals. As roxadustat sales ramp up in China, our financial position is strong with approximately \$716 million in cash at the end of the second quarter. The EMA's acceptance of the roxadustat filing for treatment of anemia in adult patients with CKD triggered milestone payments of \$130 million from Astellas to FibroGen. In addition, we have a total of \$245 million in anticipated approval and first commercial sale milestones expected over the next 12 months. We received full partner reimbursement for all developments and commercialization of roxadustat in all geographies, except China, where we shared these expenses 50-50 with AstraZeneca. Based on our current forecasts, we are reiterating our estimated 2020 ending cash to be in the range of \$720 million to \$730 million, and we're well financed for years to come. Ashley, if you could now open the lines for questions.

Question and Answer

Operator

[Operator Instructions] Your first question comes from Geoffrey Porges with SVB Leerink.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Congratulations on the positive regulatory interaction. I have to ask a little bit about that. So perhaps, Enrique, you could give us a sense of how important to the commercial opportunity is whether or not you get a black box warning for CV risk. And then secondly, could you give us a little bit more color how the China agreement with AstraZeneca has changed? And particularly how it may have influenced your flexibility with respect to the ownership and integration of that business unit?

Enrique A. Conterno

CEO & Director

Very good, Geoff. Thank you for your questions. Let me try to answer first your -- the second part of your question related to the update in our China agreement with AstraZeneca. Clearly, we believe that this updated agreement best aligns I think both organizations to maximize the economic value of roxadustat. Importantly, this agreement allows us to have both more predictable but also improved economics for FibroGen. So we are excited about having been able to update this agreement and given the significant opportunity that we see with roxadustat that has a very good chance of becoming a blockbuster product in China. I think you were referring how this impacts other future plans. I think it's -- as I mentioned in the past, we're not prepared to comment on that. But I think, if anything, having this agreement I think gives us more flexibility to do anything because I think we have a great foundation for our business in roxadustat.

As it relates to a boxed warning, as I mentioned, we're not planning to make comments when it comes to labeling going forward. But clearly, we view that roxadustat will be successful -- I think I've mentioned this to you and others in the past, very successful regardless. Clearly, we need to look at the entire label. And when we look at the label for roxadustat, including a potential boxed warning, it's going to be what does the labor in totality says and our ability to fully commercialize roxadustat, given all the benefit that it can provide. We continue to view that our data shows a very positive benefit-risk profile for the product.

Operator

Your next question comes from Michael Yee with Jefferies.

Michael Jonathan Yee

Jefferies LLC, Research Division

Congrats on the progress. Two questions for me. Enrique, I know you can't comment specifically on FDA discussions. So I guess my question is more about what sort of the key takeaways are from your mid-cycle review meeting? And what are the key shall I say, gating steps for you as you get to the end of the year on the review? Second question is on China. Maybe you can make a comment or Chris could make a comment. Obviously, a pretty strong number in the second quarter. Maybe you could just shed a little more light on that. Is there anything particularly surprising that could be a read-through to the United States, et cetera, et cetera? The United States has a different reimbursement model, of course. So maybe you could talk to how much can we read-through into things.

Enrique A. Conterno

CEO & Director

Very good. Thank you, Michael. Basically on the mid-cycle review, I think, clearly, it is -- the mid-cycle review is an overall update of our submission. But when it comes to news, as we've shared, the FDA indicated to us that there's no outcome that is planned at this stage. Clearly, you are asking about other

types of interaction with the FDA going forward. I think it should be no surprise, but clearly, labeling discussions are critical, and those will be starting soon. And of course, we need preapproval inspections and so forth. But our engagement and our interaction with the FDA was positive. So we feel good about the progress that we are making. As it relates to China, I'm going to allow Chris to give us a little more detail and color on our strong results there. Chris?

Christine L. Chung

Senior Vice President of China Operations

Thank you, Enrique. Michael, so obviously, we're very pleased with the results of the second quarter. It's a big jump from Q1. That is primarily due to increases in 2 things: hospital listings and market adoption. We looked at our channel sales. There's nothing spectacular about it. We believe it's very consistent with the market. So in terms of reading through to the future of China and the U.S., I think it just tells you the strength of the roxadustat as a drug that delivers significant benefits and efficacy to multiple patient populations, profile. And in particular, in peritoneal dialysis and non-dialysis, the oral convenience is a very attractive feature over ESA.

Enrique A. Conterno

CEO & Director

Yes. I think...

Michael Jonathan Yee

Jefferies LLC, Research Division

So to be clear, do you see good adoption in non-dialysis? I guess that was the sort of the real word of the question, too.

Christine L. Chung

Senior Vice President of China Operations

We have been very encouraged by the adoption in non-dialysis. We had anticipated that the launch market would be in dialysis, but the non-dialysis adoption has pleased us in a very positive way.

Enrique A. Conterno

CEO & Director

Yes. I think, Michael, clearly, I think what you're sensing from us is quite a bit of optimism. I think probably you sensed it during the last earnings call, but now we have some good sales results to show the progress that we're making. We are very pleased with the adoption of roxadustat in different patient populations. And you spoke about what are the implications for this to other countries? Of course, different countries have, including the U.S., different reimbursement schemes and -- but when it comes to physician adoption, I think we see a lot of read-through in terms of the benefits the health care professionals are seeing with roxadustat.

Operator

Your next question comes from Annabel Samimy with Stifel.

Xiaodong Zhang

Stifel, Nicolaus & Company, Incorporated, Research Division

This is Edwin on for Annabel. First maybe to follow Mike's question on China. We learned that in the first half, there are about 40,000 patients treated with roxa. How many of them are DD or NDD patient, if you could split them up? And how many new patients added in the second quarter? What is the launch curve do you project in the coming quarters? And then I have a follow-up, if I may.

Enrique A. Conterno

CEO & Director

Yes. I'm going to ask Chris to answer that question in China. As you know, we don't provide forward-looking forecast when it comes to roxadustat at this time. But maybe, Chris, you can provide some additional color around China.

Christine L. Chung

Senior Vice President of China Operations

Absolutely. Edwin, at this point in time, in terms of these segments, we believe 2/3 of the patients currently using roxadustat are dialysis patients, which is hemodialysis and peritoneal dialysis with the other 1/3, which is a very strong 1/3, being from non-dialysis. At this point in time, the 40,000 number is an estimate based on sales and assumptions about pricing, compliance and DOT. The increase has been from about 15,000 at the end of the first quarter to 40,000 now. It's a very nice trajectory. Obviously, looking into the second half of 2020, there will be changes in duration of treatment because many hospitals are just getting listed and reimbursement has just been implemented by the end of Q1. So at this point in time, it will be very difficult for us to project, but we continue to be very optimistic about the upward trajectory we're seeing in China.

Xiaodong Zhang

Stifel, Nicolaus & Company, Incorporated, Research Division

Great. And 2 regulatory questions. Do you think the chance for possible Adcom is significantly reduced at this point? And secondly, on CMS negotiation, have you got any preliminary agreement with CMS on the bundling issue? When do we expect any clarity on the progress with CMS, before or after roxa approval?

Enrique A. Conterno

CEO & Director

Very good. Let me try to provide maybe a reinforcement on the question related to the Adcom. So clearly, with the indication of the FDA that no Adcom is planned at this time, I think the likelihood of having an Adcom has decreased significantly. It doesn't mean that an Adcom could not be called or it's -- but it is -- the FDA is not planning for one at this stage based on the engagement that we had with them at the midcycle review.

In terms of CMS discussions, clearly, we have those discussions, but there's no such a thing as an agreement other than we will have to submit. Once we get approval, we will have to submit to CMS for the inclusion on TDAPA. And that can be done as soon as we get approval and then FDA -- the CMS will basically process that as quickly as possible. And we are -- we've done all the homework to ensure that we are ready and that we are hopeful that we can get expedited approval. I'm going to ask maybe Thane Wettig, our chief -- our newly appointed Chief Commercial Officer, maybe to make some additional comments. Thane?

Thane Wettig

Chief Commercial Officer

Yes. Thanks, Enrique. I think just to add to what Enrique said, the most important date for us is approval. And once we get approval, AstraZeneca and FibroGen will file for a HCPCS code, and then that starts the TDAPA review process. Now CMS' goal with TDAPA is to make the product available as quickly to their beneficiaries as they possibly can. And they state in their regs that their goal is to make TDAPA available within 90 -- or within the quarter within 90 days. And so that's the expectation that we have. And rest assured that we and AstraZeneca are doing everything in our power to assure the earliest possible availability of TDAPA for roxadustat.

Operator

Your next question comes from Joel Beatty with Citi.

Joel Lawrence Beatty

Citigroup Inc., Research Division

I guess, following up to the last question on TDAPA and the 90-day window, can you help provide some context of that kind of the gate-limiting factor to launching in dialysis centers? Or are there other things that need to take place, such as negotiations with the dialysis centers in order to start selling product there?

Enrique A. Conterno

CEO & Director

Yes. I'm going to -- great question. I'm going to have Thane comment, but you really need both, right? You really need TDAPA, and you really need to have the discussion with the dialysis organizations.

Thane Wettig

Chief Commercial Officer

Yes, that's exactly right. And in addition, for the dialysis-dependent patient population, our estimate is that about 2/3 of those patients will -- are currently being treated through the ESRD Prospective Payment System. And so there's about 1/3 of the patients that also go through Medicare Advantage as well as commercial. And so we'll be working actively with the priority payers. Between now and not just when product is available, but between now and even launched, having those conversations to set the stage for availability of roxadustat not only through the TDAPA designation but also through the private sector as well.

Joel Lawrence Beatty

Citigroup Inc., Research Division

Great. And then maybe just one follow-up to that. How important are agreements such as the one that Akebia has with Vifor to the dialysis market? Is that something that would be an impediment to your launch? Or is that the type of agreement that you may be exploring as well?

Enrique A. Conterno

CEO & Director

No. We -- honestly, we do not view that we have a restriction or any type of limitation for us to be able to have agreement with any of the dialysis organizations. So at this point in time, we feel we're in a very good position.

Operator

Your next question comes from Jason Gerberry with Bank of America.

Jason Matthew Gerberry

BofA Merrill Lynch, Research Division

Enrique, just to follow-up on that last comment. What do you think the value is of having a contractual arrangement with the dialysis organization for a company like Akebia if you don't view it as an impediment to your ability to garner uptake in the market? And then my other question is, can you talk a little bit about how you see the China hospital listing progressing in the second half? Just kind of curious how you're seeing that progression going versus the benefit we saw in 1Q from 2Q.

Enrique A. Conterno

CEO & Director

Yes. I think on -- thank you for your question. I think on the first question is really -- I'm not sure this is a question for FibroGen. It's probably a question for Akebia, given they're the one that pursued that agreement. When it comes to hospital listings, as we mentioned, we went from basically over 30% to over 45%. So we were at over 30% at the end of Q1. We are now over 45% at the end of Q2. If we were to benchmark some of the blockbuster products in China, innovative blockbuster products in China, I think you will see that this level of penetration and when it comes to the overall opportunity in China to be at 45% of that opportunity, I think, is very significant milestone and achievement, basically at the second

quarter post-launch. So we feel extremely good. We expect to continue to make progress, but we do not provide formal forecast whether it comes to either revenue or listing for future quarters at this stage.

Operator

Your next question comes from Difei Yang with Mizuho Securities.

Difei Yang

Mizuho Securities USA LLC, Research Division

Just a couple. The first one on roxa in China. I know it's in the early days, but for dialysis patient population, do you see most of the prescriptions going to ESA failure patients or do you see adoptions across the board in that population?

Enrique A. Conterno

CEO & Director

Yes. Let me once again call on Chris to give us some additional color on some of these dialysis-dependent patients. Are they ESA failures or treatment naive or what can you tell us?

Christine L. Chung

Senior Vice President of China Operations

So we are seeing adoption across all those patient segments. To give you a little bit of color to first look at the hemodialysis population. We are getting inflamed hyporesponses and iron-deficient patients in hemodialysis. We have not seen a very large conversion for ESA-treated patients who are maintained properly and have performed well on ESAs. On peritoneal dialysis, however, because of the oral administration, we are seeing a lot of conversion patients as well as new patients, regardless of how they have responded to ESAs in the past. So I think in terms of differentiating the product profile, it's a very, very strong value proposition to hemodialysis and peritoneal dialysis, and that is the same in the case of non-dialysis as well.

Enrique A. Conterno

CEO & Director

Chris, maybe you can also comment about China has a uniquely large peritoneal dialysis patient population. Maybe you can comment about that.

Christine L. Chung

Senior Vice President of China Operations

Absolutely. So in terms of percentage right now, the peritoneal dialysis population is around 14% to 15%. The government is trying to increase it, but it's been stable at around that percentage. China currently has 800,000 dialysis patients, expected to exceed 1 million in the next couple of years. So if you just take 15% of 800,000 patients, there are currently over 100,000 peritoneal dialysis population patients in China. We've seen very, very strong adoption in both the installed base and new patients. And the initiation rate into PD is actually higher than hemodialysis. Interestingly, COVID has played a factor in it, because many new patients prefer to not be going to a hemodialysis center 3 times a week. Unexpected trend, of course, but very, very positive for adoption of roxadustat in China.

Enrique A. Conterno

CEO & Director

Very good. Thank you, Chris.

Operator

Your next question comes from Yaron Werber with Cowen.

Brendan Smith

Cowen and Company, LLC, Research Division

This is Brendan on for Yaron. Congrats on the progress. Just a couple of quick ones from us. First, I just really wanted to ask kind of about some of the top level kind of key learnings you've picked up from the China launch so far and how you're thinking about applying some of these to the U.S. launch, particularly in light of what's going on here and all the challenges, just kind of most important considerations you're bearing in mind. And then I also wanted to just quickly ask about the MDS and CIA trials. If you can give us any more granularity on where you're at in enrollment, respective time lines and when we might get some data from either of those?

Enrique A. Conterno

CEO & Director

Yes. Let me try to address your first question. I'm going to ask Peony to discuss both the MDS and the CIA trials. When it comes to learnings from China, as you can imagine, it's probably not in our best interest to be discussing those, given the competitive environment that we have in other markets. But I think it's fair to say, I think that one of the things that we've learned is that we have the ability to be able to grow roxadustat in different patient populations. I think this is important because it gives you a number of different ways to grow. And given when we think about hemodialysis, peritoneal dialysis, non-dialysis patients, it's just a broad spectrum of patients that can give us huge legs for growth into the future. So very excited about what that could do for us in the U.S. for us to think, yes, short-term, when it comes to the launch, but also longer-term in terms of what this product could become. And I'm going to ask Peony to give us an update now on both MDS and CIA.

K. Peony Yu

Chief Medical Officer

Thank you. Both the MDS and CIA trial are going well. The COVID inevitably has had some impact on some of the study sites. And -- but we were able to work with our investigators in ensuring patient safety while optimizing patient enrollment. At the same time, we have instituted remote monitoring process and remote data review to ensure data integrity. And we are not seeing increase in subject visits or during the pandemic because our investigators are managing the study so well. And we anticipate that with all the -- some of these adaptations and continued strong effort that these 2 studies will continue to be able to be executed successfully.

Enrique A. Conterno

CEO & Director

We feel good about our enrollment with both of those trials. Despite the impact, I think the team has appropriately adapted to ensure that we can enroll very well.

Operator

Your next question comes from Paul Choi with Goldman Sachs.

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

A few for me, please. Enrique, maybe could you comment on how you see the role of roxa in the home dialysis setting here in the U.S.? Is that a commercial priority for you? And how are you thinking about potentially marketing to that market? Second, your partner presented updated NDD data from the DOLOMITES study at a recent medical meeting. I was just wondering if you could also maybe comment on your updated thoughts with regard to the MACE and MACE+ endpoints and how that adds to the totality of the existing CV data? And then third, given the uptick you've had in China so far, Enrique, how do you think about potentially unlocking shareholder value there from that business and either monetizing it or thinking about it potentially as a separate entity?

Enrique A. Conterno

CEO & Director

Yes. Very good. Let me try to have different people answer your -- the opportunities. Maybe on roxadustat and the opportunity in home dialysis, I'm going to ask Thane to maybe provide a few comments; on

DOLOMITES, I'll ask Peony to comment; and then I'll answer the question around China and unlocking shareholder value. Thane?

Thane Wettig

Chief Commercial Officer

Yes. Sure. As it relates to home dialysis, it's clearly not the priority segment as the LDO or the MDO or the other dialysis centers are the hospital-based dialysis centers. Same thing with the NDD population. We're taking a look at it right now to determine what level of presence we need in order to take advantage of that. But I think it's a different dynamic than it is in China.

Enrique A. Conterno

CEO & Director

Yes. We have clearly a very favorable product profile, but the relative size of the opportunity is smaller here than in China. Peony on NDD and DOLOMITES?

K. Peony Yu

Chief Medical Officer

Yes. So just on MDD DOLOMITES, we believe that this active control study of roxadustat being compared against darbepoetin provides further confidence on roxadustat. In that, we demonstrate efficacy in comparison to the active comparator. And importantly, the hazard ratio of MACE is 0.8. And so this is incremental confidence-building on top of the non-dialysis pool analysis.

Enrique A. Conterno

CEO & Director

Keep in mind, Paul, as we've shared before, I think there is agreement with the FDA on the studies that are the pivotal studies to be pooled for the MACE analysis in the U.S., DOLOMITES was not part of that. But of course, you see what the results are, and they are I think we can say encouraging.

When it comes to your question on unlocking value in China, the best way for us to ensure that we can lock as much value in China as possible is to make roxadustat as large as possible as we can. So for us, I think having a great launch I think is critical. Keep in mind that when we look at -- I'm going to mention this again, when we look at benchmarks of products that are innovative blockbusters in China, and when we look at either their revenue uptake or listing uptake, roxadustat studies comparing extremely well. So clearly, I think this is priority one. As I've mentioned, I think we are going to be looking at all opportunities for us to ensure that our China business is fully appreciated by our shareholders, given the huge value that we believe that we have there.

Operator

We have reached the end of the Q&A session. I will now turn the call over to Enrique Conterno for closing remarks.

Enrique A. Conterno

CEO & Director

Very good. I want to thank everyone for joining us on this earnings call. And once again, all of our collaborators, whether they are patients or health care professionals, investigators, regulators that are allowing us to progress our agenda. But in particular, I want to thank the entire FibroGen team for the commitment to the type of progress that we are seeing today. So thank you very much, everyone.

Operator

Ladies and gentlemen, this concludes today's conference call. Thank you for participating. You may now disconnect.

AstraZeneca Agreements

U.S./Rest of World ("RoW") Agreement

Effective July 30, 2013, the Company entered into a collaboration agreement with AstraZeneca AB ("AstraZeneca") for the development and commercialization of roxadustat for the treatment of anemia in the U.S. and all other countries in the world, other than China, not previously licensed under the Astellas Europe and Astellas Japan Agreements ("U.S./RoW Agreement"). It also excludes China, which is covered by a separate agreement with AstraZeneca described below. Under the terms of the U.S./RoW Agreement, AstraZeneca paid upfront, non-contingent, non-refundable and time-based payments totaling \$374.0 million (such amounts were fully received as of June 2016). Under the U.S./RoW Agreement, the Company is also eligible to receive from AstraZeneca an aggregate of approximately \$875.0 million in potential milestone payments, comprised of (i) up to \$65.0 million in milestone payments upon achievement of specified clinical and development milestone events, \$15.0 million of which was received in 2015 as a result of the finalization of its two audited pre-clinical carcinogenicity study reports, and the remaining \$50.0 million was received in April 2020 as a result of the NDA submission milestone, (ii) up to \$325.0 million in milestone payments upon achievement of specified regulatory milestone events, (iii) up to \$160.0 million in milestone payments related to activity by potential competitors and (iv) up to approximately \$325.0 million in milestone payments upon the achievement of specified commercial sales events. The aggregate amount of consideration received through June 30, 2020 totals \$439.0 million.

As mentioned above, during the second quarter of 2019, the Company received positive topline results from analyses of pooled MACE and MACE+ data from its Phase 3 trials for roxadustat, enabling the Company's NDA submission to the FDA. The regulatory milestone payment associated with this NDA submission became probable of being achieved in the second quarter of 2019. Accordingly, the consideration of \$50.0 million associated with this milestone was included in the transaction price and allocated to performance obligations under the U.S./ RoW Agreement in the second quarter of 2019, of which \$42.4 million was recognized as revenue during 2019, and \$0.4 million was recognized as revenue during the six months ended June 30, 2020, from performance obligations satisfied or partially satisfied. The Company submitted such NDA in December 2019, which was accepted by the FDA for review in February 2020. According to the U.S/RoW Agreement, this milestone payment is billable to AstraZeneca when the NDA is accepted by the FDA. Therefore this \$50.0 million was billed during the first quarter of 2020, the payment of which was fully received in April 2020.

China Agreement

Effective July 30, 2013, the Company (through its subsidiaries affiliated with China) entered into a collaboration agreement with AstraZeneca for the development and commercialization (but not manufacture) of roxadustat for the treatment of anemia in China ("China Agreement"). Under the terms of the China Agreement, AstraZeneca agreed to pay upfront consideration totaling \$28.2 million (such amounts were fully received in 2014). Under the China Agreement, the Company is also eligible to receive from AstraZeneca an aggregate of approximately \$348.5 million in potential milestone payments, comprised of (i) up to \$15.0 million in milestone payments upon achievement of specified regulatory milestone events, and (iii) up to approximately \$187.5 million in milestone payments upon the achievement of specified commercial sales and other events. The China Agreement is structured as a 50/50 profit or loss share (as defined) and provides for joint development costs (including capital and equipment costs for construction of the manufacturing plant in China), to be shared equally during the development. The aggregate amount of such consideration received through June 30, 2020 totals \$77.2 million.

In December 2019, roxadustat was included on the updated National Reimbursement Drug List ("NRDL") released by China's NHSA for the treatment of anemia in CKD, covering patients who are non-dialysis dependent as well as those who are dialysis-dependent. The inclusion on the NRDL triggered a total of \$22.0 million milestones payable to the Company by AstraZeneca. Accordingly, the total consideration of \$22.0 million associated with these milestones was included in the transaction price and allocated to performance obligations under the China Agreement during fourth quarter of 2019. This milestone payment was received during the first quarter of 2020.

Table of Contents Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 423 of 1730

AstraZeneca and Astellas approved the development of roxadustat for the treatment of chemotherapy-induced anemia in December 2018 and January 2019, respectively. Costs associated with the development of this indication are expected to be shared 50/50 between AstraZeneca and Astellas. In addition, in December 2018, anemia of chronic inflammation and multiple myeloma was approved for development by AstraZeneca and is expected to be fully funded by them. For revenue recognition purposes, the Company concluded that the addition of these new indications represents a modification to the collaboration agreements and will be accounted for separately, meaning the development costs associated with the new indications are distinct from the original development costs. The development service period for roxadustat for the treatment of chemotherapy-induced anemia, anemia of chronic inflammation and multiple myeloma under the AstraZeneca agreements is estimated to continue through the end of 2024, to allow for development of these additional indications.

On July 8, 2020, FibroGen Cayman, FibroGen Beijing and FibroGen International (Hong Kong) Limited (collectively, "FibroGen China") and AstraZeneca (together with FibroGen China, the "Parties") entered into an amendment, effective July 1, 2020, to the China Agreement, relating to the development and commercialization of roxadustat in China. See Note 10 for details.

Summary of Revenue Recognized Under the Collaboration Agreements

The table below summarizes the accounting treatment for the various performance obligations pursuant to each of the Astellas and AstraZeneca agreements. License amounts identified below are included in the "License revenue" line item in the condensed consolidated statements of operations. All other elements identified below are included in the "Development and other revenue" line item in the condensed consolidated statements of operations.

Amounts recognized as revenue under the Japan Agreement were as follows (in thousands):

			Three Months	Ended	l June 30,	 Six Months Ended June 30,			
Agreement	Performance Obligation		2020		2019	2020	2019		
Japan	License revenue	\$	_	\$	_	\$ _	\$	_	
	Development revenue	\$	164	\$	369	\$ 327	\$	615	

The transaction price related to consideration received and accounts receivable has been allocated to each of the following performance obligations under the Japan Agreement, along with any associated deferred revenue as follows (in thousands):

Japan Agreement	Cumulative Revenue Through June 30, 2020	Deferred Revenue at June 30, 2020	Total Consideration Through June 30, 2020		
License	\$ 86,024	\$ _	\$	86,024	
Development revenue	15,458	183		15,641	
Total license and development revenue	\$ 101,482	\$ 183	\$	101,665	

The revenue recognized under the Japan Agreement for the three months ended June 30, 2020 included an increase in revenue of \$0.1 million resulting from changes to estimated variable consideration in the current period relating to performance obligations satisfied or partially satisfied in previous periods. The remainder of the transaction price related to the Japan Agreement includes no further variable consideration from estimated future co-development billing.

Amounts recognized as revenue under the Europe Agreement were as follows (in thousands):

		 Three Month	ıs Ended	1 June 30,	Six Months Ended June 30,				
Agreement	Performance Obligation	2020		2019	2020		2019		
Europe	License revenue	\$ _	\$	117,470	\$	_	\$	117,470	
	Development revenue	\$ 4,602	\$	16,854	\$	9,176	\$	21,467	

Table of Contents Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 424 of 1730

The transaction price related to consideration received and accounts receivable has been allocated to each of the following performance obligations under the Europe Agreement, along with any associated deferred revenue as follows (in thousands):

Europe Agreement	umulative Revenue Through ne 30, 2020	R	Deferred evenue at ne 30, 2020	Total nsideration Through ne 30, 2020
License	\$ 487,951	\$	_	\$ 487,951
Development revenue	240,184		2,338	242,522
Total license and development revenue	\$ 728,135	\$	2,338	\$ 730,473

The revenue recognized under the Europe Agreement for the three months ended June 30, 2020 included an increase in revenue of \$1.6 million resulting from changes to estimated variable consideration in the current period relating to performance obligations satisfied or partially satisfied in previous periods. The remainder of the transaction price related to the Europe Agreement includes \$31.7 million of variable consideration from estimated future codevelopment billing and is expected to be recognized over the remaining development service period.

Amounts recognized as revenue under the U.S./RoW Agreement were as follows (in thousands):

		 Three Months	Ended Ju	ne 30,	Six Months Ended June 30,					
Agreement	Performance Obligation	2020		2019		2020		2019		
U.S. / RoW and China	License revenue	\$ _	\$	33,111	\$	_	\$	33,111		
	Development revenue	13,750		23,762		28,305		42,766		
	China performance obligation	\$ 441	\$	_	\$	594	\$	_		

The transaction price related to consideration received and accounts receivable has been allocated to each of the following performance obligations under the U.S./RoW Agreement and China Agreement, along with any associated deferred revenue as follows (in thousands):

U.S. / RoW and China Agreements	umulative Revenue Through ne 30, 2020	R	Deferred evenue at ne 30, 2020	Total Consideration Through June 30, 2020		
License	\$ 341,844	\$	_	\$	341,844	
Co-development, information sharing &						
committee services	521,572		4,547		526,119	
China performance obligation	684		140,973		141,657	
Total license and development revenue	\$ 864,100	\$	145,520	\$	1,009,620	

The revenue recognized under the U.S./RoW Agreement for the three months ended June 30, 2020 included a decrease of \$0.2 million in revenue resulting from changes to estimated variable consideration in the current period relating to performance obligations satisfied or partially satisfied in previous periods. The remainder of the transaction price related to the U.S./RoW Agreement and China Agreement includes \$90.1 million of variable consideration from estimated future co-development billing and is expected to be recognized over the remaining development service period, except for amounts allocated to the China performance obligation, which are expected to be recognized in a pattern consistent with estimated deliveries of the commercial drug product.

Product Revenue, Net

The Company started roxadustat commercial sales in China in the third quarter of 2019. Product revenue is recognized in an amount that reflects the consideration to which the Company expects to be entitled in exchange for those products, net of various sales rebates and discounts. Product revenue, net was as follows (in thousands):

	 e Months Ended une 30, 2020	Six Months Ended June 30, 2020			
Gross revenue	\$ 19,833	\$	25,205		
Non-key account hospital listing award	(2,566)		(2,566)		
Contractual sales rebate	(1,372)		(1,748)		
Other discounts and rebates	(202)		(243)		
Product revenue, net	\$ 15,693	\$	20,648		

In the second quarter of 2020, the Company amended the agreement with its pharmaceutical distributors, which triggered accounting modifications particularly related to non-key account hospital listing award. During the three months ended June 30, 2020, a \$2.6 million of non-key account hospital listing award was recorded as a reduction to the revenue, which was calculated based on eligible non-key account hospital listing to date achieved by each distributor with certain requirements met during the period.

For the three and six months ended June 30, 2020, the contractual sales rebate was \$1.4 million and \$1.7 million, respectively, which were calculated based on the stated percentage of gross sales by each distributor in the distribution agreement entered between FibroGen and each distributor. All other rebates and discounts, including sales return allowance were immaterial for the period.

The rebates and discounts that the Company's pharmaceutical distributors have earned are eligible to be applied against their future sales order, limited to certain maximums until such rebates and discounts are exhausted. These rebates and discounts are recorded as contract liabilities at the time they become eligible in the same period that the related revenue is recorded. Due to the distributor's legal right to offset, at each balance sheet date, the rebates and discounts are presented as reductions to gross accounts receivable from the distributor, or as a current liability to the distributor to the extent that the total amount exceeds the gross accounts receivable. The distributor's legal right of offset is calculated at the individual distributor level. The following table includes a roll-forward of the contract liabilities (in thousands):

												sented Net		
	Balance at December 31, 2019						Currency Gross Contract Translation Liabilities			_	Against .ccounts	Ralan	ce at June	
			Additions		Deduction		and Other		Balance		Receivable		30, 2020	
Contract liabilities	\$	(1,102)	\$	(4,907)	\$	16	\$	9	\$	(5,984)	\$	5,595	\$	(389)

Palance

As of June 30, 2020, the total rebates and discounts as reductions to gross accounts receivable was \$5.6 million, and the total contract liabilities was \$0.4 million, which was included in accrued and other current liabilities in the condensed consolidated balance sheet.

The above-mentioned contra-accounts receivable items related to product revenue consisted of the following (in thousands):

	J	June 30, 2020	December 31, 2019			
Price adjustment	\$	935	\$ 936			
Contractual sales rebate		1,878	148			
Non-key account hospital listing award		2,567	_			
Other discounts and rebates		260	18			
Provision for credit loss		84	_			
Total reductions to gross accounts receivable	\$	5,724	\$ 1,102

ITEM 2. MANAGEMENT'S DISCUSSION AND ANALYSIS OF FINANCIAL CONDITION AND RESULTS OF OPERATIONS.

You should read the following discussion and analysis of our financial condition and results of operations in conjunction with the condensed consolidated financial statements and the notes thereto included elsewhere in this Quarterly Report on Form 10-Q, and in our Securities and Exchange Commission ("SEC") filings, including our Annual Report on Form 10-K for the year ended December 31, 2019 filed with the SEC on March 2, 2020.

FORWARD-LOOKING STATEMENTS

The following discussion and information contained elsewhere in this Quarterly Report on Form 10-Q contain "forward-looking statements" within the meaning of Section 21E of the Securities Exchange Act of 1934, as amended ("Exchange Act"), Section 27A of the Securities Act of 1933, as amended ("Securities Act") and within the meaning of the Private Securities Litigation Reform Act of 1995. These statements are often identified by the use of words such as "may," "will," "expect," "believe," "anticipate," "intend," "could," "should," "estimate," or "continue," and similar expressions or variations. Such forward-looking statements are subject to risks, uncertainties and other factors that could cause actual results and the timing of certain events to differ materially from future results expressed or implied by such forward-looking statements. Factors that could cause or contribute to such differences include, but are not limited to, those discussed in the section titled "Risk Factors," set forth in Part II, Item 1A of this Quarterly Report on Form 10-Q. The forward-looking statements in this Quarterly Report on Form 10-Q represent our views as of the date of this Quarterly Report on Form 10-Q. We anticipate that subsequent events and developments will cause our views to change. New risks emerge from time to time, and it is not possible for our management to predict all risks, nor can we assess the impact of all factors on our business or the extent to which any factor, or combination of factors, may cause actual results to differ materially from those contained in any forward-looking statements we may make. In light of these risks, uncertainties, and assumptions, the forward-looking events and circumstances discussed in this Quarterly Report on Form 10-Q may not occur, and actual results could differ materially and adversely from those anticipated or implied in the forward-looking statements. While we may elect to update these forward-looking statements at some point in the future, we have no current intention of doing so except to the extent required by applicable law. You should, therefore, not rely on these forward-looking statements as representing our views as of any date subsequent to the date of this Quarterly Report on Form 10-Q and are cautioned not to place undue reliance on such forward-looking statements.

BUSINESS OVERVIEW

We were incorporated in 1993 in Delaware and are headquartered in San Francisco, California, with subsidiary offices in Beijing and Shanghai, People's Republic of China ("China"). We are a leading biopharmaceutical company developing and commercializing a pipeline of first-in-class therapeutics. We apply our pioneering expertise in hypoxia-inducible factor ("HIF"), connective tissue growth factor ("CTGF") biology, and clinical development to advance innovative medicines for the treatment of anemia, fibrotic disease, and cancer.

Roxadustat, our most advanced product, is an oral small molecule inhibitor of HIF prolyl hydroxylase ("HIF-PH") activity that has received marketing authorization in China for the treatment of anemia caused by chronic kidney disease ("CKD") in dialysis and non-dialysis patients. Evrenzo® (roxadustat) is approved in Japan for the treatment of anemia associated with CKD in dialysis patients. In January 2020, Astellas Pharma Inc. ("Astellas") submitted a supplemental New Drug Application ("NDA") in Japan for the treatment of anemia in non-dialysis CKD patients.

Our NDA filing in the United States ("U.S.") for roxadustat for the treatment of anemia in dialysis and non-dialysis CKD patients was accepted by the U.S. Food and Drug Administration ("FDA") in February 2020. In Europe, the Marketing Authorization Application ("MAA") filing for roxadustat for the treatment of anemia in dialysis and non-dialysis CKD patients was accepted for regulatory review by the European Medicines Agency ("EMA") in May 2020.

Roxadustat is in Phase 3 clinical development in the U.S. and Europe and in Phase 2/3 development in China for anemia associated with myelodysplastic syndromes ("MDS"). Roxadustat is in Phase 2 clinical development for chemotherapy-induced anemia.

Pamrevlumab, an anti-CTGF human monoclonal antibody, is in Phase 3 clinical development for the treatment of both idiopathic pulmonary fibrosis ("IPF") and pancreatic cancer. Pamrevlumab is also currently in a Phase 2 trial for Duchenne muscular dystrophy ("DMD") and is in Phase 2/3 development in Severe Acute Respiratory Syndrome Coronavirus 2019 Disease ("COVID-19").

Impact of COVID-19

On March 11, 2020, COVID-19, a disease caused by a novel strain of the coronavirus, was characterized as a pandemic by the World Health Organization. Since December 2019, COVID-19 has spread rapidly. The rapid spread has resulted in authorities implementing numerous measures to contain the virus, such as travel restrictions, social distancing requirements, quarantines, shelter-in-place orders or voluntarily adopted practices, and business shutdowns.

We have taken measures to minimize the health risks of COVID-19 to our staff, patients, healthcare providers and their communities, as their safety and well-being are our top priority. In the U.S., our employees are working remotely when possible, while in China they have returned to work in our offices, manufacturing plants, and are performing medical affairs out in the field. While we have seen some impacts from COVID-19, such as slower enrollment in our clinical trials and some effect on our roxadustat sales in China, particularly in February and March, we do not know if, or to what extent, these effects will continue in the future, as the impact of the COVID-19 pandemic continues to unfold. The effect on our operational and financial performance will depend in large part on future developments with the disease, which cannot be predicted with confidence at this time. Future developments include the duration, scope, and severity of the COVID-19 pandemic, the actions taken to contain or mitigate its impact, the impact on governmental programs and budgets, the impact on healthcare systems and operating procedures, the development of treatments or vaccines, and the resumption of widespread economic activity. Due to the inherent uncertainty of the largely unprecedented and rapidly evolving situation, we are unable to predict with any confidence the likely impact of the COVID-19 pandemic on our future operations.

The financial results for the three months ended June 30, 2020 were not significantly impacted by COVID-19 relative to prior quarters. However, we will continue to monitor, and to the extent possible, mitigate the impact of the COVID-19 pandemic on our business.

Financial Highlights

Balance Sheet					
Cash and cash equivalents	\$	429,269	\$	126,266	
Short-term and long-term investments		256,546		468,609	
Accounts receivable	\$	26,519	\$	28,455	

Our revenue for the three and six months ended June 30, 2020 included the revenue recognized related to the following:

- \$19.0 million and \$38.4 million of development revenue recognized under our collaboration agreements with our partners Astellas and AstraZeneca AB ("AstraZeneca");
- \$15.7 million and 20.6 million of net product revenue from roxadustat commercial sales in China; and
- \$8.2 million of roxadustat active pharmaceutical ingredient ("API") delivery to Astellas.

As comparison, our revenue for the three and six months ended June 30, 2019 included the revenue recognized related to the following:

- Two regulatory milestones totaling \$130.0 million associated with the MAA submission to the EMA under the collaboration agreement with Astellas for roxadustat as a treatment for dialysis and non-dialysis CKD patients;
- A \$50.0 million regulatory milestone associated with the NDA submission to the FDA under the collaboration agreement with AstraZeneca for roxadustat as a treatment for dialysis and non-dialysis CKD patients; and
- Development revenue recognized under our collaboration agreements with Astellas and AstraZeneca.

Table of Contents Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 428 of 1730

Operating costs and expenses for the three and six months ended June 30, 2020 increased compared to the same periods a year ago primarily due to the following:

- Higher outside service expenses associated with co-promotional activities expenses with AstraZeneca sales and marketing efforts in China related to
 the commercial activities of roxadustat;
- Higher clinical trial expenses associated with post-approval safety studies in China, and commencement of Phase 3 trials for pamrevlumab, offset by lower activities due to substantial completion of Phase 3 trials for roxadustat;
- Higher legal expenses primarily associated with patent-related activities in the United Kingdom;
- · Higher employee-related expenses resulting from higher average compensation level and headcount; and
- Higher drug development expenses mainly associated with higher drug substance manufacturing activities and supplies related to pamrevlumab, and higher drug substance manufacturing activities related to roxadustat in its global program.

During the three months ended June 30, 2020, we had a net loss of \$85.3 million, or net loss per basic and diluted share of \$0.95, as compared to a net income of \$116.0 million for the same period a year ago, due to a decrease in revenue and an increase in operating costs and expenses. During the six months ended June 30, 2020, we had a net loss of \$163.7 million, or net loss per basic and diluted share of \$1.84, as compared to a net income of \$70.6 million for the same period a year ago, due to a decrease in revenue and an increase in operating costs and expenses.

Cash and cash equivalents, investments and accounts receivable totaled \$712.3 million at June 30, 2020, an increase of \$89.0 million from December 31, 2019, primarily due to the cash provided by operations.

Commercial and Development Programs

Roxadustat for the Treatment of Anemia in Chronic Kidney Disease

Roxadustat is our most advanced product, an oral small molecule inhibitor of HIF-PH activity that acts by stimulating the body's natural pathway of erythropoiesis, or red blood cell production.

We continue our commercial launch efforts for roxadustat (tradename: 爱瑞卓®) in China after receiving marketing authorization for the treatment of anemia caused by CKD in non-dialysis and dialysis patients. Roxadustat was added to the National Reimbursement Drug List ("NRDL"), effective January 1, 2020. Now that China has largely re-opened, we and our partner AstraZeneca continue our strong focus on hospital listings for roxadustat. As of the end of the second quarter, roxadustat was listed at hospitals which represent approximately 45% of the CKD anemia market opportunity in China.

In Japan, our partner Astellas continues the commercial launch of Evrenzo® (roxadustat), which was approved for the treatment of anemia associated with CKD in dialysis patients. In January 2020, Astellas submitted a supplemental NDA in Japan for the treatment of anemia in CKD patients not on dialysis. This supplemental NDA is under review by the Pharmaceuticals and Medical Devices Agency for the use of roxadustat in patients with anemia of CKD not on dialysis, with an anticipated approval decision expected by year-end.

In conjunction with our collaboration partners, AstraZeneca and Astellas, we have completed the Phase 3 trials of roxadustat supporting our NDA in the U.S. and the MAA in the European Union and the United Kingdom (collectively, "Europe") for the treatment of anemia in CKD.

With respect to our U.S. NDA, we completed our mid-cycle review meeting with the FDA in June 2020 and continue to expect an FDA decision on this NDA by the Prescription Drug User Fee Act goal date of December 20, 2020. The FDA has indicated that an Advisory Committee meeting is not planned at this time.

In May 2020, our partner Astellas' MAA for roxadustat for the treatment of anemia in patients with CKD was accepted for regulatory review by the EMA. Our partner Astellas expects an approval decision by the EMA in the middle of 2021.

In addition, in collaboration with AstraZeneca, applications for marketing authorization of roxadustat in CKD anemia have been submitted for Canada, Australia, Mexico, Brazil, Chile, Taiwan, South Korea, Philippines, Singapore, and India.

During the second quarter of 2020, we announced data from roxadustat clinical trials conducted by Astellas. These data were presented in virtual oral sessions of the 57th European Renal Association-European Dialysis and Transplant Association.

Table of Contents Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 429 of 1730

The Phase 3 DOLOMITES study evaluated the efficacy and safety of roxadustat compared to darbepoetin alfa for the treatment of anemia in non-dialysis dependent patients. In the primary endpoint analysis, the study demonstrated non-inferiority of roxadustat to darbepoetin alfa in the proportion of patients achieving correction of hemoglobin (Hb) levels during the first 24 weeks of treatment (89.5% vs 78.0%; a difference of 11.51%), with a lower bound of 95% confidence interval > 0%.

Roxadustat was superior to darbepoetin alfa in decreasing low-density lipoprotein cholesterol with a least square mean (LSM) difference of -0.403 mmol/L (p<0.01) and superior in time to first intravenous iron use with a hazard ratio (HR) of 0.45 (95% CI: 0.26, 0.78; p=0.004). The non-inferiority of roxadustat to darbepoetin alfa on hypertension risk was demonstrated for mean arterial pressure change from baseline to weeks 12-28 with a LSM difference of -0.372 mmHg (95% CI: -1.587, 0.842) and time to occurrence of hypertension; HR 0.83 (95% CI: 0.56, 1.22). Regarding safety, the overall incidence of treatment-emergent adverse events was comparable between roxadustat and darbepoetin alfa (91.6% and 92.5%, respectively).

With a relatively small sample size (roxadustat n=323, darbepoetin n=293), non-confirmatory analysis of adjudicated major adverse cardiac events ("MACE"), and MACE plus hospitalized unstable angina and hospitalized congestive heart failure ("MACE+") outcomes showed HR point estimates of 0.81 (95% CI: 0.52, 1.25) and 0.90 (95% CI: 0.61, 1.32) for roxadustat as compared to darbepoetin.

Roxadustat for the Treatment of Chemotherapy-Induced Anemia

We continue to enroll our Phase 2 clinical trial of roxadustat in the U.S. in chemotherapy-induced anemia. This is a single-arm open label study investigating the efficacy and safety of roxadustat for the treatment of anemia in up to 100 patients receiving myelosuppressive chemotherapy treatment for non-myeloid malignancies, with a treatment duration of 16 weeks.

Roxadustat for the Treatment of Anemia in Myelodysplastic Syndromes

We are continuing to enroll our global 160-patient double-blind, placebo-controlled Phase 3 clinical study of roxadustat in transfusion-dependent, lower risk MDS patients. Patients are randomized 3:2 to receive roxadustat or placebo three-times-weekly. The primary endpoint is the proportion of patients who achieve 8-week transfusion independence by 28 weeks with safety evaluated up to 52 weeks.

In China, the Phase 2/3 clinical trial to evaluate the safety and efficacy of roxadustat in non-transfusion dependent, lower risk MDS patients with anemia is ongoing.

Pamrevlumab (FG-3019) - Monoclonal Antibody Against Connective Tissue Growth Factor (CTGF)

Pamrevlumab is our human monoclonal antibody that inhibits the activity of CTGF, a central mediator and critical common element in the progression of fibrotic and fibro-proliferative diseases.

In the U.S., the FDA has granted Orphan Drug Designation to pamrevlumab for the treatment of IPF, locally advanced unresectable pancreatic cancer, and DMD. Pamrevlumab has also received Fast Track designation from the FDA for the treatment of both IPF and locally advanced unresectable pancreatic cancer.

Table of Contents Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 430 of 1730

Severe Acute Respiratory Syndrome Coronavirus 2019 Disease ("COVID-19")

In June 2020, we announced initiation of an open-label, randomized, parallel-arm study investigating the efficacy and safety of pamrevlumab versus standard of care in patients with COVID-19 infection in Italy. This study is a Phase 2/3 investigator-initiated clinical trial investigating the efficacy and safety of pamrevlumab in approximately 68 patients hospitalized with COVID-19. The primary objective of this study is to assess the effect of pamrevlumab on blood oxygenation in patients with COVID-19 infection. Patients will be randomized to treatment with pamrevlumab or standard of care in a 1:1 ratio. Based on the investigator's decision, a subgroup of patients may continue treatment for up to 12 weeks.

We have also initiated a randomized, double-blind, placebo-controlled Phase 2 study investigating the efficacy and safety of pamrevlumab in hospitalized patients with acute COVID-19 infection in the U.S. This multicenter trial will enroll approximately 130 patients with COVID-19. The primary objective of this study is to assess the effect of pamrevlumab on blood oxygenation in patients with COVID-19 infection, and patients will be randomized to treatment with pamrevlumab or standard of care in a 1:1 ratio. The primary efficacy assessment is the proportion of hospitalized COVID-19 patients who have not received mechanical ventilation and/or extracorporeal membrane oxygenation (ECMO) and remain alive at Day 28.

Idiopathic Pulmonary Fibrosis

We are conducting ZEPHYRUS, our Phase 3 trial of pamrevlumab in IPF patients, and are preparing to initiate ZEPHYRUS-2, a second IPF Phase 3 study. Both studies are double-blind, placebo-controlled Phase 3 trials targeting approximately 340 patients with a primary U.S. efficacy endpoint of change from baseline in forced vital capacity. In order to minimize the risk of exposure to COVID-19 in this vulnerable IPF patient population with compromised lung function, we paused enrollment in ZEPHYRUS in the first quarter of 2020. We have now re-opened enrollment in ZEPHYRUS and will initiate the ZEPHYRUS-2 trial as COVID-19 conditions improve.

Locally Advanced Unresectable Pancreatic Cancer

In 2019, we initiated LAPIS, our double-blind placebo controlled Phase 3 clinical program for pamrevlumab as a neoadjuvant therapy for locally advanced unresectable pancreatic cancer. We intend to enroll approximately 260 patients, randomized at a 1:1 ratio to receive either pamrevlumab or placebo, in each case in combination with gemcitabine and nab-paclitaxel. We are working with clinical trial sites and investigators in order to mitigate risks and other challenges associated with COVID-19 and the restrictions instituted to combat COVID-19.

Duchenne Muscular Dystrophy

In the third quarter of 2020, we expect to initiate a Phase 3 clinical trial, LELANTOS, evaluating pamrevlumab as a treatment for DMD. LELANTOS will be a double-blind, placebo-controlled trial in approximately 90 non-ambulatory DMD patients. Patients will be randomized at a 1:1 ratio to pamrevlumab or placebo and have a treatment period of 52 weeks. The primary endpoint will assess change in upper limb strength and additional endpoints will include pulmonary, performance, cardiac, and fibrosis assessments.

Table of Contents Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 431 of 1730

Collaboration Partnerships for Roxadustat

Our current and future research, development, manufacturing and commercialization efforts with respect to roxadustat and our other product candidates currently in development depend on funds from our collaboration agreements with Astellas and AstraZeneca as described below.

Astellas

In June 2005, we entered into a collaboration agreement with Astellas for the development and commercialization (but not manufacture) of roxadustat for the treatment of anemia in Japan ("Japan Agreement"). In April 2006, we entered into the Europe Agreement with Astellas for roxadustat for the treatment of anemia in Europe, the Commonwealth of Independent States, the Middle East, and South Africa. Under these agreements, we provide Astellas the right to develop and commercialize roxadustat for anemia indications in these territories.

We share responsibility with Astellas for clinical development activities required for the U.S. and the EU regulatory approval of roxadustat and share equally those development costs under the agreed development plan for such activities. Astellas will be responsible for clinical development activities and all associated costs required for regulatory approval in all other countries in the Astellas territories. Astellas will own and have responsibility for regulatory filings in its territories. We are responsible, either directly or through our contract manufacturers, for the manufacture and supply of all quantities of roxadustat to be used in development and commercialization under the agreements.

The Astellas agreements will continue in effect until terminated. Either party may terminate the agreements for certain material breaches by the other party. In addition, Astellas will have the right to terminate the agreements for certain specified technical product failures, upon generic sales reaching a particular threshold, upon certain regulatory actions, or upon our entering into a settlement admitting the invalidity or unenforceability of our licensed patents. Astellas may also terminate the agreements for convenience upon advance written notice to us. In the event of any termination of the agreements, Astellas will transfer and assign to us the regulatory filings for roxadustat and will assign or license to us the relevant trademarks used with the products in the Astellas territories. Under certain terminations, Astellas is also obligated to pay us a termination fee.

Consideration under these agreements includes a total of \$360.1 million in upfront and non-contingent payments, and milestone payments totaling \$557.5 million, of which \$542.5 million are development and regulatory milestones and \$15.0 million are commercial-based milestones. Total consideration, excluding development cost reimbursement and product sales-related payments, could reach \$917.6 million. The aggregate amount of such consideration received through June 30, 2020 totals \$630.1 million. Additionally, under these agreements, Astellas pays 100% of the commercialization costs in its territories. Astellas will pay us a transfer price, based on net sales, in the low 20% range for our manufacture and delivery of roxadustat.

During the second quarter of 2019, we received positive topline results from analyses of pooled MACE and MACE+ data from its Phase 3 trials evaluating roxadustat as a treatment for dialysis and non-dialysis CKD patients, enabling Astellas to prepare for an MAA submission to the EMA, following our NDA submission to the FDA in 2019. These milestones became probable of being achieved in the second quarter of 2019, and substantially all of the total consideration of \$130.0 million associated with these milestones was included in the transaction price and allocated to performance obligations under the Europe Agreement in the second quarter of 2019, of which \$128.8 million was recognized as revenue during 2019, and \$0.6 million was recognized as revenue during the six months ended June 30, 2020, from performance obligations satisfied or partially satisfied. According to the Europe Agreement, these milestone payments were billed to Astellas upon the submission of an MAA in the second quarter of 2020 and the total \$130.0 million was received during the same quarter.

In addition, as of June 30, 2020, Astellas had separate investments of \$80.5 million in the equity of FibroGen, Inc.

AstraZeneca

In July 2013, we entered into the U.S./RoW Agreement, a collaboration agreement with AstraZeneca for roxadustat for the treatment of anemia in the U.S. and all territories not previously licensed to Astellas, except China. In July 2013, through our China subsidiary and related affiliates, we entered into the China Agreement, a collaboration agreement with AstraZeneca for roxadustat for the treatment of anemia in China. Under these agreements, we provide AstraZeneca the right to develop and commercialize roxadustat for anemia in these territories. We share responsibility with AstraZeneca for clinical development activities required for U.S. regulatory approval of roxadustat.

In 2015, we reached the \$116.5 million cap on our initial funding obligations (during which time we shared 50% of the joint initial development costs), therefore all development and commercialization costs for roxadustat for the treatment of anemia in CKD in the U.S., Europe, Japan and all other markets outside of China have been paid by Astellas and AstraZeneca since reaching the cap.

In China, FibroGen (China) Medical Technology Development Co., Ltd. ("FibroGen Beijing") will conduct the development work for CKD anemia, will hold all of the regulatory licenses issued by China regulatory authorities, and will be primarily responsible for regulatory, clinical and manufacturing. China development costs are shared 50/50. AstraZeneca is also responsible for 100% of development expenses in all other licensed territories outside of China. Outside of China, we are responsible, through our contract manufacturers, for the manufacture and supply of all quantities of roxadustat to be used in development and commercialization under the AstraZeneca agreements.

Under the AstraZeneca agreements, we will receive upfront and subsequent non-contingent payments totaling \$402.2 million. Potential milestone payments under the agreements total \$1.2 billion, of which \$571.0 million are development and regulatory milestones and \$652.5 million are commercial-based milestones. Total consideration under the agreements, excluding development cost reimbursement, transfer price payments, royalties and profit share, could reach \$1.6 billion. The aggregate amount of such consideration received through June 30, 2020 totals \$516.2 million.

Under the U.S./RoW Agreement, AstraZeneca will pay for all commercialization costs in the U.S. and RoW and AstraZeneca will be responsible for the U.S. commercialization of roxadustat, with FibroGen undertaking specified promotional activities in the end-stage renal disease segment in the U.S. In addition, we will receive a transfer price for delivery of commercial product based on a percentage of net sales in the low- to mid-single digit range and AstraZeneca will pay us a tiered royalty on net sales of roxadustat in the low 20% range.

Under the China Agreement, which is conducted through FibroGen China Anemia Holdings, Ltd., FibroGen Beijing, and FibroGen International (Hong Kong) Limited (collectively, ("FibroGen China"), the commercial collaboration is structured as a 50/50 profit share. AstraZeneca will conduct commercialization activities in China and fund roxadustat launch costs in China and will only receive reimbursement once FibroGen Beijing has achieved profitability. As of June 30, 2020, we accrued \$116.2 million of cumulative co-promotional expenses related to the estimated amount payable to AstraZeneca for such sales and marketing efforts.

Payments under these agreements include over \$500.0 million in upfront, non-contingent and other payments received or expected to be received prior to the first U.S. approval, excluding development expense reimbursement.

AstraZeneca may terminate the U.S./RoW Agreement upon specified events, including our bankruptcy or insolvency, our uncured material breach, technical product failure, or upon 180 days prior written notice at will. If AstraZeneca terminates the U.S./RoW Agreement at will, in addition to any unpaid non-contingent payments, it will be responsible for paying for a substantial portion of the post-termination development costs under the agreed development plan until regulatory approval.

AstraZeneca may terminate the China Agreement upon specified events, including our bankruptcy or insolvency, our uncured material breach, technical product failure, or upon advance prior written notice at will. If AstraZeneca terminates our China Agreement at will, it will be responsible for paying for transition costs as well as make a specified payment to FibroGen China.

In the event of any termination of the agreements, but subject to modification upon termination for technical product failure, AstraZeneca will transfer and assign to us any regulatory filings and approvals for roxadustat in the affected territories that they may hold under our agreements, grant us licenses and conduct certain transition activities.

As mentioned above, during the second quarter of 2019, we received positive topline results from analyses of pooled MACE and MACE+ data from its Phase 3 trials for roxadustat, enabling our NDA submission to the FDA. The regulatory milestone payment associated with this NDA submission became probable of being achieved in the second quarter of 2019. Accordingly, the consideration of \$50.0 million associated with this milestone was included in the transaction price and allocated to performance obligations under the U.S./ RoW Agreement in the second quarter of 2019, of which \$42.4 million was recognized as revenue during 2019, and \$0.4 million was recognized as revenue during the six months ended June 30, 2020, from performance obligations satisfied or partially satisfied. We submitted such NDA in December 2019, which was accepted by the FDA for review in February 2020. According to the U.S/RoW Agreement, this milestone payment is billable to AstraZeneca when the NDA is accepted by the FDA. Therefore, this \$50.0 million milestone was billed during the first quarter of 2020, the payment of which was fully received in April 2020.

In December 2019, roxadustat was included on the updated NRDL released by China's National Healthcare Security Administration for the treatment of anemia in CKD, covering patients who are non-dialysis-dependent as well as those who are dialysis-dependent. The inclusion on the NRDL triggered a total of \$22.0 million milestones payable to us by AstraZeneca. Accordingly, the total consideration of \$22.0 million associated with these milestones was included in the transaction price and allocated to performance obligations under the U.S./ RoW Agreement in the fourth quarter of 2019. This milestone payment was fully received during the first quarter of 2020.

On July 8, 2020, FibroGen China and AstraZeneca (together with FibroGen China, the "Parties") entered into an amendment, effective July 1, 2020, to the China Agreement, relating to the development and commercialization of roxadustat in China (the "Amendment").

The Amendment provides for the establishment of a jointly owned entity (the "Distribution Entity") that will perform roxadustat distribution, as well as conduct sales and marketing through AstraZeneca. FibroGen Beijing will continue to hold all of the regulatory licenses issued by China regulatory authorities and will continue to be primarily responsible for regulatory, clinical, manufacturing, medical affairs and pharmacovigilance. In July 2020, the Company closed the acquisition of an entity for the purpose of the establishment of the Distribution Entity.

While the responsibilities of the Parties under the China Agreement remain largely the same, certain changes are being made. The Parties have changed the method under which commercial expenses are billed, and the collaboration will be adjusted to more fully account for the cost of manufacturing. These changes will be implemented retroactively to April 1, 2020. AstraZeneca's billings for sales and marketing are now subject to an annual cap at a percentage of net sales, until they have been fully reimbursed for their costs, at which point AstraZeneca will invoice based on actual costs, subject to the annual cap.

Once the Distribution Entity is fully operational expected in early 2021, AstraZeneca will invoice the Distribution Entity for its sales and marketing services provided to the Distribution Entity, and FibroGen Beijing will manufacture and supply commercial product to the Distribution Entity.

FibroGen is expected to recognize revenue based on its sales to the Distribution Entity.

Development costs will continue to be shared 50/50 between the Parties.

FibroGen, Inc. and AstraZeneca concurrently amended the US/RoW Agreement to reflect minor changes in the governance structure under the China Agreement.

We are in the process of evaluating the accounting impacts resulting from the Amendment and the establishment of the Distribution Entity, which is expected to be significant to our consolidated financial statements starting the third quarter of 2020. Among others, the accrued long-term co-promotional expenses related to the estimated amount payable to AstraZeneca for its sales and marketing efforts associated with the commercial launch and sales for roxadustat will be reduced by approximately \$82 million in the third quarter of 2020.

Additional Information Related to Collaboration Agreements

Total cash consideration received through June 30, 2020 and potential cash consideration, other than development cost reimbursement, transfer price payments, royalties and profit share, pursuant to our existing collaboration agreements are as follows:

		Cash Received Through June 30, 2020		Additional Potential Cash Payments	Total Potential Cash Payments	
	_			(in thousands)		,
Astellasrelated-party:						
Japan Agreement	\$	90,093	\$	82,500	\$	172,593
Europe Agreement		540,000		205,000		745,000
Total Astellas	·	630,093	<u> </u>	287,500		917,593
AstraZeneca:						
U.S. / RoW Agreement		439,000		810,000		1,249,000
China Agreement		77,200		299,500		376,700
Total AstraZeneca		516,200		1,109,500		1,625,700
Total revenue	\$	1,146,293	\$	1,397,000	\$	2,543,293

These collaboration agreements also provide for reimbursement of certain fully burdened research and development costs as well as direct out of pocket expenses.

RESULTS OF OPERATIONS

Revenue

		Three Months Ended June 30,		Change		Six Months Ended June 30,						
	2020	2019	\$	%	2020	2019	\$	%				
	(dollars in thousands)											
Revenue:												
License revenue	\$ —	\$ 150,581	\$ (150,581)	(100) %	\$ —	\$ 150,581	\$ (150,581)	(100) %				
Development and other revenue	18,957	40,985	(22,028)	(54) %	38,402	64,848	(26,446)	(41) %				
Product revenue, net	15,693	_	15,693	100 %	20,648	_	20,648	100 %				
Drug product revenue	8,238	_	8,238	100 %	8,238	_	8,238	100 %				
Total revenue	\$ 42,888	\$ 191,566	\$(148,678)	(78) %	\$ 67,288	\$ 215,429	\$ (148,141)	(69) %				

Our revenue to date has been generated substantially from our collaboration agreements with Astellas and AstraZeneca. In addition, we started roxadustat commercial sales in China in the third quarter of 2019.

Under our revenue recognition policy, license revenue includes amounts from upfront, non-refundable license payments and amounts allocated pursuant to the standalone selling price method from other consideration received during the periods. This revenue is generally recognized as deliverables are met and services are performed. We did not have any license revenue for the three and six months ended June 30, 2020.

Development and other revenue includes co-development and other development related services. Co-development services are recognized as revenue in the period in which they are billed to our partners, excluding China. For China co-development services, revenue is deferred until the end of the development period once all performance obligations have been satisfied. Other development related services are recognized as revenue over the noncontingent development period based on a proportional performance method. As of June 30, 2020, the future non-contingent development periods range from 12 to 60 months. Other revenues consist of sales of research and development material and have been included with development and other revenue in the consolidated statements of operations, as they have not been material for any of the periods presented.

Product revenue is recognized when our customer obtains control of promised goods or services in an amount that reflects the consideration we expect to receive in exchange for those goods or services.

Drug product revenue includes commercial-grade API sales to Astellas for purpose of roxadustat commercial launch in Japan, and is recognized when we fulfill all the delivery obligations.

Table of Contents

PART II—OTHER INFORMATION

ITEM 1. LEGAL PROCEEDINGS

We are not currently a party to any material legal proceedings.

ITEM 1A. RISK FACTORS

Investing in our common stock involves a high degree of risk. You should carefully consider the risks described below in addition to the other information included or incorporated by reference in this Quarterly Report on Form 10-Q, including our condensed consolidated financial statements and the related notes and "Management's Discussion and Analysis of Financial Condition and Results of Operations," before deciding whether to invest in our common stock. The occurrence of any of the events or developments described below could harm our business, financial condition, results of operations and growth prospects. In such an event, the market price of our common stock could decline, and you may lose all or part of your investment. Although we have discussed all known material risks, the risks described below are not the only ones that we may face. Additional risks and uncertainties not presently known to us or that we currently deem immaterial may also impair our business operations.

We have marked with an asterisk (*) those risks described below that reflect substantive changes from the risks described under Part I, Item 1A "Risk Factors" included in our Annual Report on Form 10-K for the year ended December 31, 2019.

Risks Related to Our Financial Condition and History of Operating Losses

We have incurred significant losses since our inception and anticipate that we will continue to incur losses for the foreseeable future and may never achieve or sustain profitability. We may require additional financings in order to fund our operations.*

We are a biopharmaceutical company with two lead product candidates in clinical development, roxadustat in anemia in chronic kidney disease ("CKD"), myelodysplastic syndromes ("MDS"), and chemotherapy-induced anemia, and pamrevlumab in idiopathic pulmonary fibrosis ("IPF"), pancreatic cancer, Duchenne muscular dystrophy ("DMD"), and Severe Acute Respiratory Syndrome Coronavirus 2019 Disease ("COVID-19"). Most of our revenue generated to date has been based on our collaboration agreements and we have limited commercial drug product sales to date. We continue to incur significant research and development and other expenses related to our ongoing operations. Our net loss for the year ended December 31, 2019, 2018 and 2017 were \$77.0 million, \$86.4 million and \$120.9 million, respectively. As of June 30, 2020, we had an accumulated deficit of \$948.4 million. As of June 30, 2020, we had capital resources consisting of cash, cash equivalents and short-term investments of \$685.6 million plus \$0.2 million of long-term investments classified as available for sale securities. Despite contractual development and cost coverage commitments from our collaboration partners, AstraZeneca AB ("AstraZeneca") and Astellas Pharma Inc. ("Astellas"), and the potential to receive milestone and other payments from these partners, and despite commercialization efforts in the People's Republic of China ("China") and Japan for roxadustat for the treatment of anemia caused by CKD, we anticipate we will continue to incur losses on an annual basis for the foreseeable future. If we do not successfully develop and continue to obtain regulatory approval for our existing or any future product candidates and effectively manufacture, market and sell the product candidates that are approved, we may never achieve or sustain profitability on a quarterly or annual basis. Our prior losses, combined with expected future losses, have had and will continue to have an adverse effect on our stockholders' equity and working capital. Our failure to become and

Table of Contents Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 436 of 1730

We believe that we will continue to expend substantial resources for the foreseeable future as we continue late-stage clinical development of roxadustat, grow our operations in China, expand our clinical development efforts on pamrevlumab, continue to seek regulatory approval, launch commercialization of our product candidates, and pursue additional indications. These expenditures will include costs associated with research and development, conducting preclinical trials and clinical trials, obtaining regulatory approvals in various jurisdictions, and manufacturing and supplying products and product candidates for ourselves and our partners. The outcome of any clinical trial and/or regulatory approval process is highly uncertain and we are unable to fully estimate the actual costs necessary to successfully complete the development and regulatory approval process for our compounds in development and any future product candidates. We believe that the net proceeds from our 2017 public offerings, our existing cash and cash equivalents, short-term and long-term investments and accounts receivable, and expected third-party collaboration revenues will allow us to fund our operating plans through at least the next 12 months. Our operating plans or third-party collaborations may change as a result of many factors, including the success of our development and commercialization efforts, operations costs (including manufacturing and regulatory), competition, and other factors that may not currently be known to us, and we therefore may need to seek additional funds sooner than planned, through offerings of public or private securities, debt financings or other sources, such as royalty monetization or other structured financings. Such financings may result in dilution to stockholders, imposition of debt covenants and repayment obligations, or other restrictions that may adversely affect our business. We may also seek additional capital due to favorable market conditions or strategic considerations even if we currently believe

Additional funds may not be available when we require them, or on terms that are acceptable to us. If adequate funds are not available to us on a timely basis, we may be required to delay, limit, reduce or terminate our research and development efforts or other operations or activities that may be necessary to commercialize our product candidates.

Most of our recent revenue has been earned from collaboration partners for our product candidates under development.

If either or both of our Astellas and AstraZeneca collaborations were to be terminated, we could require significant additional capital in order to proceed with development and commercialization of our product candidates, including with respect to our commercialization of roxadustat for the treatment of anemia caused by CKD, or we may require additional partnering in order to help fund such development and commercialization. If adequate funds or partners are not available to us on a timely basis or on favorable terms, we may be required to delay, limit, reduce or terminate our development or commercialization efforts or other operations.

Risks Related to the Development and Commercialization of Our Product Candidates

We are substantially dependent on the success of our lead product, roxadustat, and our second compound in development, pamrevlumab.*

To date, we have invested a substantial portion of our efforts and financial resources in the research and development of roxadustat and pamrevlumab. While we have received approval of our New Drug Applications ("NDA") for roxadustat in China for CKD anemia for patients on dialysis and not on dialysis, and for roxadustat in Japan for CKD anemia in dialysis patients, we will need to make substantial additional investments in the development of roxadustat worldwide and in various indications. Our near-term prospects, including maintaining our existing collaborations with Astellas and AstraZeneca, will depend heavily on successful development and commercialization of roxadustat, including obtaining additional regulatory approvals for the commercialization of roxadustat for anemia associated with CKD.

Our other lead product candidate, pamrevlumab, is currently in clinical development for IPF, pancreatic cancer, DMD, and COVID-19. Pamrevlumab requires substantial further development and investment and we do not have a collaboration partner for support of this compound. In addition, pamrevlumab is a monoclonal antibody, which may require greater financial resources than for our small molecule, roxadustat.

The clinical and commercial success of roxadustat and pamrevlumab will depend on a number of factors, many of which are beyond our control, and we may be unable to complete the development or commercialization of roxadustat or pamrevlumab.*

The clinical and commercial success of roxadustat and pamrevlumab will depend on a number of factors, including the following:

- the timely initiation and completion of our clinical trials, including for the duration of the COVID-19 pandemic, which could cause delays in our clinical trial initiation and patient enrollment and completion;
- our ability to demonstrate the safety and efficacy of our product candidates to the satisfaction of the relevant regulatory authorities;

Table of Contents Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 437 of 1730

- the ultimate approval criteria (which may include non-inferiority margins and statistical analyses methods), indications, patient populations, and ultimate benefit-risk analysis used by regulatory authorities in their approval processes:
- whether we are required by the United States ("U.S.") Food and Drug Administration ("FDA") or other regulatory authorities to conduct additional clinical trials, and the scope and nature of such clinical trials, prior to approval to market our products;
- the clinical indications for which the product is approved and the labeling required by regulatory authorities for use with the product, including any warnings that may be required in the labeling;
- the receipt or timely receipt of marketing approvals from the FDA and foreign regulatory authorities, including pricing and reimbursement determinations;
- the ability to successfully commercialize, market, sell and distribute our product candidates, if approved, for marketing and sale by the FDA or foreign regulatory authorities, whether alone or in collaboration with others;
- whether we or our partners are able to recruit and retain adequate numbers of effective sales and marketing personnel for the sale of our products;
- whether we will maintain sufficient funding to cover the costs and expenses associated with creating and sustaining a capable sales and marketing organization and related commercial infrastructure;
- whether we can compete successfully as a new entrant in the treatment of anemia caused by CKD;
- our ability and the ability of our third-party manufacturing partners to manufacture quantities of our product candidates at quality levels necessary to meet regulatory requirements and at a scale sufficient to meet anticipated demand at a cost that allows us to achieve profitability;
- our success in educating health care providers, patients and the healthcare community about the benefits, risks, administration and use of our product candidates, if approved;
- acceptance of our product candidates, if approved, as safe and effective by patients and the healthcare community;
- the success of efforts to enter into relationships with large dialysis organizations involving the administration of roxadustat to dialysis patients;
- the achievement and maintenance of compliance with all regulatory requirements applicable to us and our product candidates;
- the maintenance of an acceptable benefit/risk profile of our products following any approval;
- the availability, perceived advantages, relative cost, relative safety, and relative efficacy of alternative and competitive treatments;
- the restrictions on the use of our products together with other medications, if any;
- our ability to negotiate, obtain and sustain an adequate level of pricing or reimbursement for our products by third-party payors;
- the availability of adequate coverage and reimbursement or pricing by third-party payors and government authorities;
- our ability to enforce successfully our intellectual property rights for our product candidates and against the products of potential competitors;
- our ability to avoid or succeed in third-party patent interference or patent infringement claims; and
- sufficient stability data for launch and market supply.

Many of these factors are beyond our control. Successful commercialization of our products will require significant resources and time, and there is a risk that we may not successfully commercialize them. If we do not achieve one or more of these factors in a timely manner or at all, we could experience significant delays or an inability to successfully commercialize our products and generate revenues, which would deprive us from additional working capital and would materially harm our ability to achieve profitability through the sale of or royalties from our product candidates.

Table of Contents Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 438 of 1730

As a company, we have limited commercialization experience, and the time and resources to develop such experience are significant. If we fail to achieve and sustain commercial success for roxadustat, either directly or with our collaboration partners, our business would be harmed.*

We do not have a sales or marketing infrastructure and have limited experience in the sales, marketing or distribution of pharmaceutical products in any country. To achieve commercial success for any product for which we obtain marketing approval, we will need to establish sales and marketing capabilities or make and maintain our existing arrangements with third parties to perform these services at a level sufficient to support our commercialization efforts.

To the extent that we would undertake sales and marketing of any of our products directly, there are risks involved with establishing our own sales, marketing and distribution capabilities. Factors that may inhibit our efforts to commercialize our products on our own include:

- our inability to recruit, train and retain adequate numbers of effective sales and marketing personnel;
- the inability of sales personnel to obtain access to physicians or persuade adequate numbers of physicians to prescribe any future products;
- our inability to effectively manage geographically dispersed sales and marketing teams;
- the lack of complementary products to be offered by sales personnel, which may put us at a competitive disadvantage relative to companies with more extensive product lines; and
- unforeseen costs and expenses associated with creating an independent sales and marketing organization.

With respect to roxadustat, we are dependent on the commercialization capabilities of our collaboration partners, AstraZeneca and Astellas. If either such partner were to terminate its agreement with us, we would have to commercialize on our own or with another third party. We will have limited or little control over the commercialization efforts of such third parties, and any of them may fail to devote the necessary resources and attention to sell and market our products, if any, effectively. If they are not successful in commercializing our product candidates, our business and financial condition would suffer.

Commercializing roxadustat requires us to establish commercialization systems, including but not limited to, medical affairs, sales, pharmacovigilance, supply-chain, and distribution capabilities to perform our portion of the collaborative efforts. These efforts require resources and time. If we, along with Astellas and AstraZeneca, are not successful in setting our marketing, pricing and reimbursement strategy, facilitating adoption by hospitals, recruiting sales and marketing personnel or in building a sales and marketing infrastructure, we will have difficulty commercializing roxadustat, which would adversely affect our business and financial condition.

Although regulatory approval has been obtained for roxadustat in China and Japan, we may be unable to obtain regulatory approval for our product candidates in other countries, or such approval may be delayed or limited, due to a number of factors, many of which are beyond our control.*

The clinical trials and the manufacturing of our product candidates are and will continue to be, and the marketing of our product candidates will be, subject to extensive and rigorous review and regulation by numerous government authorities in the U.S. and in other countries where we intend to develop and, if approved, market any product candidates. Before obtaining regulatory approval for the commercial sale of any product candidate, we must demonstrate through extensive preclinical trials and clinical trials that the product candidate is safe and effective for use in each indication for which approval is sought. The regulatory review and approval process is expensive and requires substantial resources and time, and in general very few product candidates that enter development receive regulatory approval. In addition, our collaboration partners for roxadustat have final control over development decisions in their respective territories and they may make decisions with respect to development or regulatory authorities that delay or limit the potential approval of roxadustat, or increase the cost of development or commercialization. Accordingly, we may be unable to successfully develop or commercialize roxadustat, pamrevlumab, or any of our other product candidates in one or more indications and jurisdictions.

Table of Contents Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 439 of 1730

Moreover, for any Phase 3 clinical trial to support an NDA/Biologics License Application submission for approval, the FDA and foreign regulatory authorities require compliance with regulations and standards (including good clinical practices ("GCP") requirements for designing, conducting, monitoring, recording, analyzing, and reporting the results of clinical trials) to ensure that (1) the data and results from trials are credible and accurate; and (2) that the rights, integrity and confidentiality of trial participants are protected. Although we rely on third parties to conduct our clinical trials, we as the sponsor remain responsible for ensuring that each of these clinical trials is conducted in accordance with its general investigational plan and protocol under legal and regulatory requirements, including GCP. Regulatory authorities enforce these GCP requirements through periodic inspections of trial sponsors, principal investigators and trial sites. If we or any of our CROs, trial sites, principal investigators or other third parties fail to comply with applicable GCP requirements, the clinical data generated in our clinical trials may be deemed unreliable. Accordingly, the FDA or other regulatory authorities may require us to exclude the use of patient data from these unreliable clinical trials, or perform additional clinical trials before approving our marketing applications. The FDA or other regulatory authorities may even reject our application for approval or refuse to accept our future applications.

Regulatory authorities may take actions or impose requirements that delay, limit or deny approval of our product candidates for many reasons, including, among others:

- our failure to adequately demonstrate to the satisfaction of regulatory authorities that roxadustat is safe and effective in treating anemia in CKD or that pamrevlumab is safe and effective in treating IPF, pancreatic cancer, DMD or COVID-19;
- our failure to demonstrate that a product candidate's clinical and other benefits outweigh its safety risks;
- our failure of clinical trials to meet the level of statistical significance required for approval;
- the determination by regulatory authorities that additional clinical trials are necessary to demonstrate the safety and efficacy of roxadustat or pamrevlumab, or that ongoing clinical trials need to be modified in design, size, conduct or implementation;
- our product candidates may exhibit an unacceptable safety signal as they advance through clinical trials, in particular controlled Phase 3 trials:
- the clinical research organizations ("CROs") that conduct clinical trials on our behalf may take actions outside of our control that materially adversely impact our clinical trials;
- we or third-party contractors manufacturing our product candidates may not maintain current good manufacturing practices ("cGMP"), successfully pass inspection or meet other applicable manufacturing regulatory requirements;
- regulatory authorities may not agree with our interpretation of the data from our preclinical trials and clinical trials; or
- collaboration partners may not perform or complete their clinical programs in a timely manner, or at all.

Any of these factors, many of which are beyond our control, could jeopardize our or our collaboration partners' abilities to obtain regulatory approval for our product candidates in one or more indications.

The FDA or other regulatory authorities may require more information (including additional preclinical or clinical data to support approval), which may delay or prevent approval or cause us to abandon the development program altogether. In addition, if our product candidates produce undesirable side effects or safety issues, the FDA may require the establishment of REMS (or other regulatory authorities may require the establishment of a similar strategy), that may restrict distribution of our approved products, if any, and impose burdensome implementation requirements on us.

Preclinical, Phase 1 and Phase 2 clinical trial results may not be indicative of the results that may be obtained in larger, controlled Phase 3 clinical trials required for approval.

Clinical development is expensive and can take many years to complete, and its outcome is inherently uncertain. Failure can occur at any time during the clinical trial process. Success in preclinical and early clinical trials, which are often highly variable and use small sample sizes, may not be predictive of similar results in humans or in larger, controlled clinical trials, and successful results from clinical trials in one indication may not be replicated in other indications.

Many companies in the pharmaceutical and biotechnology industries have suffered significant setbacks in late-stage clinical trials after achieving positive results in early-stage development, and we may face similar setbacks.

Table of Contents Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 440 of 1730

We do not know whether our ongoing or planned clinical trials of roxadustat or pamrevlumab will need to be redesigned based on interim results or if we will be able to achieve sufficient patient enrollment or complete planned clinical trials on schedule.*

Clinical trials can be delayed or terminated for a variety of reasons, including delay or failure to:

- address any physician or patient safety concerns that arise during the course of the trial;
- obtain required regulatory or institutional review board approval or guidance;
- reach timely agreement on acceptable terms with prospective CROs and clinical trial sites;
- recruit, enroll and retain patients through the completion of the trial, including for the duration of the COVID-19 pandemic;
- maintain clinical sites in compliance with clinical trial protocols;
- initiate or add a sufficient number of clinical trial sites; and
- manufacture sufficient quantities of product candidate for use in clinical trials.

In particular, identifying and qualifying patients to participate in clinical trials of our product candidates is critical to our success. The timing of our clinical trials depends on the rate at which we can recruit and enroll patients in testing our product candidates. Patients may be unwilling to participate in clinical trials of our product candidates for a variety of reasons, some of which may be beyond our control, including:

- severity of the disease under investigation;
- availability of alternative treatments;
- size and nature of the patient population;
- eligibility criteria for and design of the study in question;
- perceived risks and benefits of the product candidate under study;
- ability to enroll patients in clinical trials during the COVID-19 pandemic;
- ongoing clinical trials of competitive agents;
- physicians' and patients' perceptions of the potential advantages of our product candidates being studied in relation to available therapies or other products under development;
- our CRO's and our trial sites' efforts to facilitate timely enrollment in clinical trials;
- patient referral practices of physicians; and
- ability to monitor patients and collect patient data adequately during and after treatment.

If we have difficulty enrolling a sufficient number of patients to conduct our clinical trials as planned, we may need to delay, limit or terminate on-going or planned clinical trials.

In addition, we could encounter delays if a clinical trial is suspended or terminated by us, by the relevant institutional review boards at the sites at which such trials are being conducted, or by the FDA or other regulatory authorities. A suspension or termination of clinical trials may result from any number of factors, including failure to conduct the clinical trial in accordance with regulatory requirements or our clinical protocols, inspection of the clinical trial operations or trial site by the FDA or other regulatory authorities resulting in the imposition of a clinical hold, unforeseen safety issues or adverse side effects, changes in laws or regulations, or a principal investigator's determination that a serious adverse event could be related to our product candidates. Any delays in completing our clinical trials will increase the costs of the trial, delay the product candidate development and approval process and jeopardize our ability to commence marketing and generate revenues. Any of these occurrences may materially and adversely harm our business, operations, and prospects.

Our product candidates may cause or have attributed to them undesirable side effects or have other properties that delay or prevent their regulatory approval or limit their commercial potential.

Undesirable side effects caused by our product candidates or that may be identified as related to our product candidates by physician investigators conducting our clinical trials or even competing products in development that utilize a similar mechanism of action or act through a similar biological disease pathway could cause us or regulatory authorities to interrupt, delay or halt clinical trials and could result in the delay or denial of regulatory approval by the FDA or other regulatory authorities and potential product liability claims. If we determine that there is a likely causal relationship between a serious adverse event and our product candidate, and such safety event is material or significant enough, it may result in:

- our Phase 3 clinical trial development plan becoming longer and more extensive;
- regulatory authorities increasing the data and information required to approve our product candidates and imposing other requirements; and
- our collaboration partners terminating our existing agreements.

The occurrence of any or all of these events may cause the development of our product candidates to be delayed or terminated, which could materially and adversely affect our business and prospects. Refer to "Business — Overview" in the 2019 Form 10-K for a discussion of the adverse events and serious adverse events that have emerged in clinical trials of roxadustat and pamrevlumab.

Clinical trials of our product candidates may not uncover all possible adverse effects that patients may experience.

Clinical trials are conducted in representative samples of the potential patient population, which may have significant variability. Clinical trials are by design based on a limited number of subjects and of limited duration for exposure to the product used to determine whether, on a potentially statistically significant basis, the planned safety and efficacy of any product candidate can be achieved. As with the results of any statistical sampling, we cannot be sure that all side effects of our product candidates may be uncovered, and it may be the case that only with a significantly larger number of patients exposed to the product candidate for a longer duration, that a more complete safety profile is identified. Further, even larger clinical trials may not identify rare serious adverse effects or the duration of such studies may not be sufficient to identify when those events may occur. There have been other products, including erythropoiesis stimulating agents ("ESAs"), for which safety concerns have been uncovered following approval by regulatory authorities. Such safety concerns have led to labeling changes or withdrawal of ESAs products from the market. While our most advanced product candidate is chemically unique from ESAs, it or any of our product candidates may be subject to known or unknown risks. Patients treated with our products, if approved, may experience adverse reactions and it is possible that the FDA or other regulatory authorities may ask for additional safety data as a condition of, or in connection with, our efforts to obtain approval of our product candidates. If safety problems occur or are identified after our product candidates reach the market, we may, or regulatory authorities may require us to amend the labeling of our products, recall our products or even withdraw approval for our products.

If we or third-party manufacturers and other service providers on which we rely cannot manufacture sufficient quantities of our products and product candidates, or at sufficient quality, or perform other services we require, we may experience delays in development, regulatory approval, launch or successful commercialization.*

Completion of our clinical trials and commercialization of our products require access to, or development of, facilities to manufacture and manage our product candidates at sufficient yields, quality and at commercial scale. Although we have entered into commercial supply agreements for the manufacture of some of our drug candidates, active pharmaceutical ingredients ("API"), intermediates or raw materials, we will need to enter into additional commercial supply agreements, including for backup or second source third-party manufacturers. We may not be able to enter into these agreements with satisfactory terms or on a timely manner.

We have limited experience manufacturing or managing third parties in manufacturing any of our product candidates in the volumes that are expected to be necessary to support large-scale clinical trials and sales. In addition, we have limited experience forecasting supply requirements or coordinating supply chain (including export management) for launch or commercialization, which is a complex process involving our third-party manufacturers and logistics providers, and for roxadustat, our collaboration partners. We may not be able to accurately forecast supplies for commercial launch, or do so in a timely manner and our efforts to establish these manufacturing and supply chain management capabilities may not meet our requirements as to quantities, scale-up, yield, cost, potency or quality in compliance with cGMP, particularly if the marketing authorization or market uptake is more rapid than anticipated or we have an unanticipated surge in demand.

Table of Contents Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 442 of 1730

We have a limited amount of roxadustat and pamrevlumab in storage, limited capacity reserved at our third-party manufacturers, and, even if we have or are able to put supply agreements in place for our products, there are long lead times required to manufacture and scale-up the manufacture of additional supply, as required for both late-stage clinical trials, post-approval trials, and commercial supply. If we are unable to forecast, order or manufacture sufficient quantities of roxadustat or pamrevlumab on a timely basis, it may delay our development, launch or commercialization in some or all indications we are currently pursuing. Any delay or interruption in the supply of our product candidates or products could have a material adverse effect on our business and operations.

Our commercial drug product and the product we use for clinical trials must be produced under applicable cGMP regulations. Failure to comply with these regulations may require us to recall commercial product or repeat clinical trials, which would impact sales revenue or delay the regulatory approval process.

We may add or change manufacturers for our products. We may also make changes to our manufacturing processes or to our product specifications, including in order to accommodate changes in regulations, manufacturing equipment or to account for different processes at new or second source suppliers. If we make any such changes with respect to roxadustat or pamrevlumab we will need to demonstrate comparability to the products and processes already approved or in approval by various regulatory authorities, including potentially through the conduct of additional clinical trials. Even if we do demonstrate comparability, a regulatory agency could challenge that result which could delay our development or commercialization progress. Any of these occurrences may materially impact our operations and potential profitability.

We, and even an experienced third-party manufacturer, may encounter difficulties in production. Difficulties may include:

- costs and challenges associated with scale-up and attaining sufficient manufacturing yields, in particular for biologic products such as pamrevlumab, which is a monoclonal antibody;
- contracting with additional suppliers and validation/qualification of additional facilities to meet growing demand;
- supply chain issues, including coordination of multiple contractors in our supply chain and securing necessary licenses (such as export licenses);
- the timely availability and shelf life requirements of raw materials and supplies;
- equipment maintenance issues or failure;
- quality control and quality assurance issues;
- shortages of qualified personnel and capital required to manufacture large quantities of product;
- compliance with regulatory requirements that vary in each country where a product might be sold;
- capacity or forecasting limitations and scheduling availability in contracted facilities; and
- natural disasters, such as pandemics, including the COVID-19 pandemic, floods, storms, earthquakes, tsunamis, and droughts, or accidents such as fire, that affect facilities, possibly limit or postpone production, and increase costs.

The FDA and European Medicines Agency ("EMA") will do their own benefit risk analysis and may reach a different conclusion than we or our partners have internally, and these regulatory authorities may base their approval decision on different analyses, data, and statistical methods than ours

Even if we believe we have achieved positive clinical results, such as superiority or non-inferiority, in certain endpoints, populations or subpopulations, or using certain statistical methods of analysis, the FDA and EMA will each conduct their own benefit-risk analysis and may reach different conclusions, using different statistical methods, different endpoints or definitions thereof, or different patient populations or sub-populations, and regulatory authorities may change their approvability criteria based on their internal analyses and discussions with expert advisors. Regulatory authorities may approve roxadustat for fewer or more limited indications than we request or may grant approval contingent on the performance of costly post-approval clinical trials. While we will present to regulatory authorities certain pre-specified and not pre-specified sub-populations and sub-group analyses (for example, incident dialysis), multiple secondary endpoints, and multiple analytical methods (such as long-term follow up analyses), including adjusted and censored data, regulatory authorities may reject these analyses, methods, or even parts of our trial design or certain data from our studies, the rationale for our pre-specified non-inferiority margins or other portions of our statistical analysis plans. In addition, even if we are able to provide positive data with respect to certain analyses, such as incident dialysis, estimated glomerular filtration rate, hepcidin, or quality of life measures, regulatory authorities may not include such claims on any approved labeling for roxadustat, which may limit the commercialization or market opportunity for roxadustat. The failure to obtain regulatory approval, or any label, population or other approval limitations in any jurisdiction, may significantly limit our ability to generate revenues, and any failure to obtain such approval for all of the indications and labeling claims we deem desirable could reduce our potential revenue.

Even if we are able to obtain regulatory approval of our product candidates, the label we obtain may limit the indicated uses for which our product candidates may be marketed.

With respect to roxadustat, regulatory approvals obtained, could limit the approved indicated uses for which roxadustat may be marketed. For example, our label approved in Japan, includes the following warning: "Serious thromboembolism such as cerebral infarction, myocardial infarction, and pulmonary embolism may occur, possibly resulting in death, during treatment with roxadustat." Additionally, in the U.S., ESAs have been subject to significant safety warnings, including the "Black Box" warnings on their labels. The safety concerns relating to ESAs may result in labeling for roxadustat containing similar warnings even if our Phase 3 clinical trials do not suggest that roxadustat has similar safety issues. Even if the label for roxadustat does not contain all of the warnings contained in the "Black Box" warning for ESAs, the label for roxadustat may contain other warnings or limit the market opportunity or approved indications for roxadustat. These warnings could include warnings against exceeding specified hemoglobin targets and other warnings that derive from the lack of clarity regarding the safety issues associated with ESAs, even if our Phase 3 clinical trials do not themselves raise safety concerns.

We face substantial competition, which may result in others discovering, developing or commercializing products before, or more successfully, than we do.*

The development and commercialization of new pharmaceutical products is highly competitive. Our future success depends on our ability and/or the ability of our collaboration partners to achieve and maintain a competitive advantage with respect to the development and commercialization of our product candidates. Our objective is to discover, develop and commercialize new products with superior efficacy, convenience, tolerability, and safety. We expect that in many cases, the products that we commercialize will compete with existing, market-leading products of companies that have large, established commercial organizations.

If roxadustat is approved and launched commercially, competing drugs are expected to include ESAs, particularly in those patient segments where ESAs are used. Currently available ESAs include epoetin alfa (EPOGEN ®, marketed by Amgen Inc. in the U.S., Procrit ® and Erypo ®/Eprex ®, marketed by Johnson & Johnson Inc., and Espo ® marketed by Kyowa Hakko Kirin in Japan and China), darbepoetin (Amgen/Kyowa Hakko Kirin's Aranesp ® and NESP ®) and Mircera ® marketed by Hoffmann-La Roche ("Roche") outside of the U.S. and by Vifor Pharma, a Roche licensee, in the U.S. and Puerto Rico, as well as biosimilar versions of these currently marketed ESA products. ESAs have been used in the treatment of anemia in CKD for more than 30 years, serving a significant majority of dialysis CKD patients. While non-dialysis CKD patients who are not under the care of nephrologists, including those with diabetes and hypertension, do not typically receive ESAs and are often left untreated, some non-dialysis patients under nephrology care may be receiving ESA therapy. It may be difficult to encourage healthcare providers and patients to switch to roxadustat from products with which they have become familiar.

We may also face competition from potential new anemia therapies currently in clinical development, including in those patient segments not currently addressed by ESAs. Companies that are currently developing hypoxia-inducible factor ("HIF") prolyl hydroxylase ("HIF-PH") inhibitors for anemia in CKD indications include GlaxoSmithKline plc ("GSK"), Bayer Corporation ("Bayer"), Akebia Therapeutics, Inc. ("Akebia"), Japan Tobacco, and Zydus Cadila. Akebia is currently conducting Phase 3 studies in CKD patients on dialysis and not on dialysis, as well as a Phase 2 study evaluating pharmacokinetics and pharmacodynamics in dialysis patients with three-times weekly versus once-a-day dosing. In Japan, Mitsubishi Tanabe Pharmaceutical Corporation, Akebia's collaboration partner, received approval for vadadustat on June 29, 2020 for the treatment of anemia of CKD patients on and not on dialysis. Price listing for and subsequent launch of vadadustat in Japan is expected in Q3 2020. GSK is also conducting global Phase 3 studies in CKD patients on dialysis and not on dialysis, and expects to complete those studies by March 2022. GSK and Kyowa Hakko Kirin announced in November 2018 that the two companies signed a strategic commercialization deal in Japan for daprodustat. GSK received approval for daprodustat in Japan on June 29, 2020 for the treatment of anemia of CKD patients on and not on dialysis. Price listing for and subsequent launch of daprodustat in Japan is expected in Q3 2020. Bayer has completed global Phase 2 studies and its HIF-PH inhibitor is now in Phase 3 development in CKD populations on dialysis and not on dialysis in Japan. Japan Tobacco submitted an NDA for treatment of anemia associated with CKD in Japan in November 2019, supported by the six Phase 3 studies conducted in CKD patients on dialysis and not on dialysis in Japan, and its partner JW Pharmaceuticals started a Phase 3 study in dialysis patients in Korea in 2019. Zydus Cadila (India) started Phase 3 studies in dialysis and non-dialysis CKD patients in India in 2019. In July 2020, Zydus received approval from the FDA to begin studies of desidustat for the treatment of chemotherapy-induced anemia, which could potentially be competitive with roxadustat within this indication.

Table of Contents Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 444 of 1730

In addition, there are other companies developing or that have developed biologic therapies for the treatment of other anemia indications that we may also seek to pursue in the future, including anemia of MDS. For example, Acceleron Pharma, Inc., in partnership with Celgene Corporation, a Bristol-Myers Squibb company ("Celgene"), developed Reblozyl® (luspatercept), a protein therapeutic. Reblozyl was approved for treatment of anemia in adult patients with \(\beta\)-thalassemia in November 2019, and in April 2020 for treatment of anemia failing an ESA therapy and requiring two or more red blood cell transfusions over eight weeks in adult patients with very low- to intermediate-risk MDS with ring sideroblast or with myelodysplastic or myeloproliferative neoplasm with ring sideroblasts and thrombocytosis. In June 2020, Acceleron received European Commission approval for luspatercept for the treatment of transfusion-dependent anemia in adult patients with MDS or \(\beta\)-thalassemia. In Japan, Celgene started a luspatercept Phase 2 study in May 2019. We may face competition for patient recruitment, enrollment for clinical trials, and potentially in commercial sales. There may also be new therapies for renal-related diseases that could limit the market or level of reimbursement available for roxadustat if and when it is commercialized.

In China, locally manufactured epoetin alfa are offered by Chinese pharmaceutical companies such as EPIAO marketed by 3SBio Inc. as well as more than 15 other local manufacturers. We may also face competition by HIF-PH inhibitors from other companies such as Akebia, Bayer, and GSK, which was authorized by the National Medical Products Administration ("NMPA") to conduct trials in China to support its ex-China regulatory filings. Two domestic companies, Jiangsu Hengrui Medicine Co., Ltd. and Guandong Sunshine Health Investment Co., Ltd, have been permitted by the NMPA to conduct clinical trials for CKD anemia patients both on dialysis and not on dialysis, and 3SBio Inc. has submitted a clinical trial application to the NMPA to initiate trials for their HIF-PH inhibitor. Another domestic company, China Medical System, in-licensed desidustat, a compound that is currently in Phase 3 trials in India, from Zydus Cadila for greater China in January 2020. Akebia announced in December 2015 that it had entered into a development and commercialization partnership with Mitsubishi Tanabe Pharmaceutical Corporation for its HIF-PH inhibitor vadadustat in Japan, Taiwan, South Korea, India and certain other countries in Asia, and announced in April 2017 an expansion of their U.S. collaboration with Otsuka to add markets, including China. 3SBio Inc. announced in 2016 its plan to begin a Phase 1 clinical trial of a HIF-PH inhibitor for the China market.

The first biosimilar ESA, Pfizer's Retacrit® (epoetin zeta), entered the U.S. market in November 2018. Market penetration of Retacrit and the potential addition of other biosimilar ESAs currently under development may alter the competitive and pricing landscape of anemia therapy in CKD patients on dialysis under the end-stage renal disease bundle. The patents for Amgen's EPOGEN® (epoetin alfa) expired in 2004 in Europe, and the final material patents in the U.S. expired in May 2015. Several biosimilar versions of currently marketed ESAs are available for sale in Europe, China and other territories. In the U.S., a few ESA biosimilars are currently under development. Sandoz, a division of Novartis, markets Binocrit® (epoetin alfa) in Europe and may file a biosimilar Biologics License Application in the U.S.

The majority of the current CKD anemia market focuses on dialysis patients, who visit dialysis centers on a regular basis, typically three times a week, and anemia therapies are administered as part of the visit. Two of the largest operators of dialysis clinics in the U.S., DaVita Healthcare Partners Inc. ("DaVita"), and Fresenius Medical Care AG & Co. KGaA ("Fresenius"), collectively provide dialysis care to more than 80% of U.S. dialysis patients, and therefore have historically executed long-term contracts including rebate terms with Amgen. DaVita has a six-year sourcing and supply agreement with Amgen effective through 2022. Fresenius' contract with Amgen expired in 2015, following which Fresenius is providing Roche's ESA Mircera® to a significant portion of its U.S. dialysis patients. Successful penetration in this market will likely require a definitive agreement with Fresenius and/or DaVita, on favorable terms and on a timely basis.

If approved and launched commercially to treat IPF, pamrevlumab is expected to compete with Roche's Esbriet® (pirfenidone), and Boehringer Ingelheim's Ofev® (nintedanib). We believe that if pamrevlumab can be shown to safely stabilize or reverse lung fibrosis, and thus stabilize or improve lung function in IPF patients, it can compete with pirfenidone and nintedanib for market share in IPF. However, it may be difficult to encourage treatment providers and patients to switch to pamrevlumab from an oral product with which they are already familiar to a product delivered via in-office infusion. Furthermore, pirfenidone and nintedanib may be produced as generics in the near future. We may also face competition from potential new IPF therapies in recruitment and enrollment in our clinical trials and potentially in commercialization.

Pamrevlumab is a monoclonal antibody which may be more expensive and less convenient than oral small molecules such as nintedanib and pirfenidone. Other potential competitive product candidates in various stages of development for IPF include Galapagos NV's GLPG1690 and GLPG1205, Kadmon Holdings, Inc.'s KD025, Liminal BioSciences' PBI-4050, and Roche/Promedior, Inc.'s PRM-151. In particular, GLPG1690 is in a Phase 3 program consisting of two clinical trials with 750 subjects each, intended to support both the U.S. NDA and Marketing Authorization Application ("MAA") in Europe.

Table of Contents Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 445 of 1730

If pamrevlumab is approved and launched commercially to treat locally advanced pancreatic cancer patients who are not candidates for surgical resection, pamrevlumab may face competition from products currently used for pancreatic cancer. These include FOLFRINOX, a combination chemotherapy regimen of folic acid, 5-fluouracil, oxaliplatin and irinotecan, and agents seeking approval in combination with gemcitibine and nab-paclitaxel from companies such as Rafael Pharma's defactinib/CPI-613 and Merrimack's istiratumab. Gemcitabine and/or nab-paclitaxel are the current standard of care in the first-line treatment of metastatic pancreatic cancer.

Celgene Corporation's Abraxane® (nab-paclitaxel) was launched in the U.S. and Europe in 2013 and 2014, and was the first drug approved in this disease in nearly a decade.

If approved and launched commercially to treat DMD, pamrevlumab is expected to face competition from drugs that have been approved in major markets such as the U.S., EU, and Japan. On September 19, 2016, the FDA approved Sarepta Therapeutics Inc.'s ("Sarepta") Exondys 51^{TM} (eteplirsen). This was the first drug approved to treat DMD. Exondys 51 is approved to treat patients who have a mutation of the dystrophin gene amenable to exon 51 skipping, representing approximately 13% of patients with DMD. In Europe, Sarepta received a negative opinion for its marketing application for eteplirsen from the EMA in September 2018. Sarepta has reported a full year Exondys 51 revenue of \$380 million in 2019. Sarepta's Vyondys 53^{TM} (golodirsen) was also approved by the FDA in December 2019 for patients with a confirmed genetic mutation that is amenable to exon 53 skipping, which accounts for 8% of the DMD population.

PTC Therapeutics' product Translarna TM received a conditional approval in Europe in 2014, which was renewed in November 2016 with a request for a new randomized placebo-controlled 18-month study by the Committee for Medicinal Products for Human Use of the EMA; however, the FDA informed the sponsor in a complete response letter in October 2017, as well as in its response to PTC Therapeutics' appeal, that the FDA is unable to approve the application in its current form. An additional Phase 3 study is currently ongoing. While Translarna TM targets a different set of DMD patients from those targeted by Sarepta's Exondys 51®, it is also limited to a subset of patients who carry a specific mutation. Conversely, pamrevlumab is intended to treat DMD patients without limitation to type of mutation.

Pamrevlumab may also face competition from other drugs currently in clinical development in patient recruiting and enrollment in clinical trials, and, if approved, in commercialization. Examples of those compounds currently under clinical development are the drug candidates from Pfizer, Catabasis Pharmaceuticals ("Catabasis"), Santhera Pharmaceuticals ("Santhera") and Sarepta. Pfizer initiated a Phase 3 study with PF-06939926, its AAV9 minidystrophin gene therapy for DMD in February 2020. Catabasis' edasalonexent was reported to have preserved muscle function and slowed the progression of DMD compared to rates of change in the control period prior to treatment with edasalonexent in a Phase 2 study, and is currently undergoing Phase 3 development. Santhera's Puldysa® (idebenone) MAA for treatment of DMD was filed with the EMA in May 2019, and the opinion from the Committee for Medicinal Products for Human Use is expected in the third quarter of 2020. The FDA requested additional clinical data from the idebenone Phase 3 trial currently ongoing in the U.S. and Europe. Santhera offers compassionate use of idebenone in patients with DMD in U.S. and UK. Sarepta's SRP-9001 is an investigational gene therapy for DMD. Sarepta announced in December 2019 the licensing agreement with Roche that grants Roche the commercial rights to SRP-9001 outside the U.S.

The success of any or all of these potential competitive products may negatively impact the development and potential for success of pamrevlumab. In addition, any competitive products that are on the market or in development may compete with pamrevlumab for patient recruitment and enrollment for clinical trials or may force us to change our clinical trial design, including, in order to compare pamrevlumab against another drug, which may be the new standard of care.

Moreover, many of our competitors have significantly greater resources than we do. Large pharmaceutical companies, in particular, have extensive experience in clinical testing, obtaining regulatory approvals, recruiting patients, manufacturing pharmaceutical products, and commercialization. In the potential anemia market for roxadustat, for example, large and established companies such as Amgen and Roche, among others, compete aggressively to maintain their market shares. In particular, the currently marketed ESA products are supported by large pharmaceutical companies that have greater experience and expertise in commercialization in the anemia market, including in securing reimbursement, government contracts and relationships with key opinion leaders; conducting testing and clinical trials; obtaining and maintaining regulatory approvals and distribution relationships to market products; and marketing approved products. These companies also have significantly greater scale, research and marketing capabilities than we do and may also have products that have been approved or are in later stages of development and have collaboration agreements in our target markets with leading dialysis companies and research institutions. If we and our collaboration partners are not able to compete effectively against existing and potential competitors, our business and financial condition may be materially and adversely affected.

No or limited reimbursement or insurance coverage of our approved products, if any, by third-party payors may render our products less attractive to patients and healthcare providers.

Market acceptance and sales of any approved products will depend significantly on reimbursement or coverage of our products by government or third-party payors and may be affected by existing and future healthcare reform measures or prices of related products for which the government or third-party reimbursement applies. Coverage and reimbursement by the government or a third-party payor may depend upon a number of factors, including the payor's determination that use of a product is:

- a covered benefit under applicable health plan;
- safe, effective and medically necessary;
- appropriate for the specific patient;
- cost-effective; and
- neither experimental nor investigational.

Obtaining coverage and reimbursement approval for a product from a government or other third-party payor is a time consuming and costly process that could require us to provide supporting scientific, clinical and cost-effectiveness data for the use of our products to the payor, which we may not be able to provide. Furthermore, the reimbursement policies of third-party payors may significantly change in a manner that renders our clinical data insufficient for adequate reimbursement or otherwise limits the successful marketing of our products. Even if we obtain coverage for our product candidates, third-party payors may not establish adequate reimbursement amounts, which may reduce the demand for, or the price of, our products. For example, the initial roxadustat reimbursement prices set by the Ministry of Health, Labour and Welfare in Japan in November 2019 did not reflect innovation premium over the current ESA therapy, despite roxadustat's advantages observed in our clinical programs. We believe the Japanese authority's decision was primarily based on the comparability of roxadustat shown in the Japan Phase 3 studies that supported the Japan NDA, that was not designed to evaluate the outcome and additional efficacy and safety data observed in the large global Phase 3 programs that included over 8,000 patients. We have no control over whether the agency will revisit the pricing once they review the comprehensive data from the global Phase 3 program including the major adverse cardiac event /MACE plus hospitalized unstable angina and hospitalized congestive heart failure outcomes. If reimbursement is not available or is available only to limited levels or only in subsets of the dialysis and non-dialysis populations, we may not be able to successfully commercialize certain of our products, or in particular jurisdictions.

Price controls may limit the price at which products such as roxadustat, if approved, are sold. For example, reference pricing is used by various Europe member states and parallel distribution, or arbitrage between low-priced and high-priced member states, can further reduce prices. In some countries, we or our partner may be required to conduct a clinical trial or other studies that compare the cost-effectiveness of our product candidates to other available products in order to obtain or maintain reimbursement or pricing approval. Publication of discounts by third-party payors or authorities may lead to further pressure on the prices or reimbursement levels within the country of publication and other countries. If reimbursement of our products is unavailable or limited in scope or amount, or if pricing is set at unacceptable levels, we or our partner may elect not to commercialize our products in such countries, and our business and financial condition could be adversely affected.

Risks Related to COVID-19

Our business could be adversely affected by the ongoing COVID-19 global pandemic as a result of the current and potential future impacts on our commercialization efforts, supply chain, regulatory and clinical development activities, and other business operations, in addition to the impact of a global economic slowdown.*

Our business could be adversely affected by the effects of the COVID-19 pandemic, which has resulted in various and evolving government-mandated restrictions in order to reduce the spread of the disease.

The effects of the COVID-19 pandemic, the associated government-mandated restrictions and the other effects on healthcare systems, the economy, and society as a whole, may negatively impact productivity, disrupt our business, and delay our clinical programs and timelines, the magnitude of which will depend, in part, on the progression of the disease, the length and severity of the restrictions, and other impacts and limitations on our ability to conduct our business in the ordinary course. These disruptions in our operations could negatively impact our business, operating results, and financial condition. The extent of the impact on the COVID-19 pandemic on our business and financial results will continue to depend on numerous evolving factors that we are not able to accurately predict and which will vary by market, including the duration and scope of the pandemic, global economic conditions during and after the pandemic, and governmental actions that have been taken, or may be taken in the future, in response to the pandemic.

Table of Contents Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 447 of 1730

We have taken measures to minimize the health risks of COVID-19 to our staff, patients, healthcare providers, and their communities, as their safety and well-being are our top priority. Despite these efforts, there is a risk that one or more of our employees, including members of senior management, could contract COVID-19. Certain jurisdictions have begun re-opening only to return to restrictions in the face of increases in new COVID-19 cases. Our U.S. employees are working remotely when possible, and we may experience reduced productivity due to the remote work environment. In addition, there are other risks from remote work including but not limited to the potential for reduced oversight of third parties we work with, such as manufacturing and clinical sites. In China, our staff have returned to work in our offices, manufacturing plants, and are performing medical affairs out in the field.

Most of our, and our partners', commercial launch activities are continuing, and have resumed in China after the government shutdown during February and March. However, sales growth of roxadustat may be slowed due to continued social distancing measures, behaviors, or other restrictions. If there are any further COVID-19 outbreaks, we or our partners may need to re-institute or tighten restrictions on our operations.

While our clinical trials for MDS, CIA and locally advanced pancreatic cancer have continued to enroll, enrollment for IPF was paused at the beginning of the second quarter and has since resumed. However, we have seen impacts from COVID-19 on all of our clinical trials to varying degrees. There is a risk that any or all of our clinical trials will be delayed due to slowed or paused enrollment or site initiation, and direct COVID-19 impacts to clinical sites and clinical service providers. In addition, while we are trying to mitigate the effect of COVID-19 on existing patients, it is possible that some patients may not be able to continue to comply with protocols, which could further delay our clinical trial progress.

We believe we have sufficient roxadustat and pamrevlumab supplies for our expected commercial and clinical requirements over the next year and we and our manufacturing partners are currently continuing manufacturing operations. However, we only have a limited stockpile of these drug supply products, and therefore, if there is a greater impact from the COVID-19 pandemic than we have expected, or if manufacturing operations are halted again, we could face shortages in our global supply chains.

Any such supply disruptions could adversely impact our clinical development and ability to generate revenues from our approved products and our business, financial condition, results of operations and growth prospects could be materially adversely affected.

Due to these and potentially additional business disruptions, there may be delays to any of our business areas including our drug supply chains, problems with our distribution or warehousing vendors, or delays to our (and our partners') clinical trials or other development efforts, or commercialization and launch activities. The full extent of these effects are unknown, but all of them could have a material impact on our operations and revenue.

In addition, to the extent the ongoing COVID-19 pandemic adversely affects our business and results of operations, it may also have the effect of heightening many of the other risks and uncertainties described in this "*Risk Factors*" section.

Risks Related to Our Reliance on Third Parties

If our collaborations with Astellas or AstraZeneca were terminated, if Astellas or AstraZeneca were to prioritize other initiatives over their collaborations with us, whether as a result of a change of control or otherwise, if conflicts arise between us and Astellas or AstraZeneca, or if Astellas or AstraZeneca becomes our competitor in the future, our ability to successfully develop and commercialize our product candidates would suffer.*

We have entered into collaboration agreements with respect to the development and commercialization of our lead product candidate, roxadustat, with Astellas and AstraZeneca. These agreements provide for reimbursement of our development costs by our collaboration partners and also provide for commercialization of roxadustat throughout the major territories of the world.

Our agreements with Astellas and AstraZeneca provide each of them with the right to terminate their respective agreements with us, upon the occurrence of negative clinical results, delays in the development and commercialization of our product candidates or adverse regulatory requirements or guidance. The termination of any of our collaboration agreements would require us to fund and perform the further development and commercialization of roxadustat in the affected territory, or pursue another collaboration, which we may be unable to do, either of which could have an adverse effect on our business and operations. In addition, each of those agreements provides our respective partners the right to terminate any of those agreements upon written notice for convenience. Moreover, if Astellas or AstraZeneca, or any successor entity, were to determine that their collaborations with us are no longer a strategic priority, or if either of them or a successor were to reduce their level of commitment to their collaborations with us, our ability to develop and commercialize roxadustat could suffer. In addition, some of our collaborations are exclusive and preclude us from entering into additional collaboration agreements with other parties in the area or field of exclusivity.

Table of Contents Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 448 of 1730

If we fail to establish and maintain strategic collaborations related to our product candidates, we will bear all of the risk and costs related to the development and commercialization of any such product candidate, and we may need to seek additional financing, hire additional employees and otherwise develop expertise at significant cost. This in turn may negatively affect the development of our other product candidates as we direct resources to our most advanced product candidates.

Our collaboration partners also have certain rights to control decisions regarding the development and commercialization of our product candidates with respect to which they are providing funding. If we have a disagreement over strategy and activities with our collaboration partners, our plans for obtaining approval may be revised and negatively affect the anticipated timing and potential for success of our product candidates. Even if a product under a collaboration agreement is approved, we will remain substantially dependent on the commercialization strategy and efforts of our collaboration partners, and neither of our collaboration partners has experience in commercialization of an anemia drug, or novel drug such as roxadustat in the dialysis market. If our collaboration partners are unsuccessful in their commercialization efforts, our results will be affected.

With respect to our collaboration agreements for roxadustat, there are additional complexities in that we and our collaboration partners, Astellas and AstraZeneca, must reach consensus on our development programs and regulatory activities, including for the NDA in the U.S. and the MAA in Europe. Multi-party decision-making is complex and involves significant time and effort, and there can be no assurance that the parties will cooperate or reach consensus, or that one or both of our partners will not ask to proceed independently in some or all of their respective territories or functional areas of responsibility in which the applicable collaboration partner would otherwise be obligated to cooperate with us. Any disputes or lack of cooperation with us by either Astellas or AstraZeneca may negatively impact the timing or success of our regulatory approval applications.

We intend to conduct proprietary research programs in specific disease areas that are not covered by our collaboration agreements. Our pursuit of such opportunities could, however, result in conflicts with our collaboration partners in the event that any of our collaboration partners takes the position that our internal activities overlap with those areas that are exclusive to our collaboration agreements. Moreover, disagreements with our collaboration partners could develop over rights to our intellectual property, including the enforcement of those rights. In addition, our collaboration agreements may have provisions that give rise to disputes regarding the rights and obligations of the parties. Any conflict with our collaboration partners could lead to the termination of our collaboration agreements, delay collaborative activities, reduce our ability to renew agreements or obtain future collaboration agreements or result in litigation or arbitration and would negatively impact our relationship with existing collaboration partners, and could impact our commercial results.

Certain of our collaboration partners could also become our competitors in the future. If our collaboration partners develop competing products, fail to obtain necessary regulatory approvals, terminate their agreements with us prematurely or fail to devote sufficient resources to the development and commercialization of our product candidates, the development and commercialization of our product candidates and products could be delayed.

We rely on third parties for the conduct of most of our preclinical and clinical trials for our product candidates, and if our third-party contractors do not properly and successfully perform their obligations under our agreements with them, we may not be able to obtain or may be delayed in receiving regulatory approvals for our product candidates.*

We rely heavily on university, hospital, dialysis centers and other institutions and third parties, including the principal investigators and their staff, to carry out our clinical trials in accordance with our clinical protocols and designs. We also rely on a number of third-party CROs to assist in undertaking, managing, monitoring and executing our ongoing clinical trials, including those for roxadustat. We expect to continue to rely on CROs, clinical data management organizations, medical institutions and clinical investigators to conduct our development efforts in the future, including our continued development of roxadustat. We compete with many other companies for the resources of these third parties, and large pharmaceutical companies often have significantly more extensive agreements and relationships with such third-party providers, and such third-party providers may prioritize the requirements of such large pharmaceutical companies over ours. The third parties on whom we rely may terminate their engagements with us at any time, which may cause delay in the development and commercialization of our product candidates. If any such third party terminates its engagement with us or fails to perform as agreed, we may be required to enter into alternative arrangements, which would result in significant cost and delay to our product development program. Moreover, our agreements with such third parties generally do not provide assurances regarding employee turnover and availability, which may cause interruptions in the research on our product candidates by such third parties.

Table of Contents Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 449 of 1730

Moreover, while our reliance on these third parties for certain development and management activities will reduce our control over these activities, it will not relieve us of our responsibilities. For example, the FDA and foreign regulatory authorities require compliance with regulations and standards, including GCP requirements for designing, conducting, monitoring, recording, analyzing and reporting the results of clinical trials to ensure that the data and results from trials are credible and accurate and that the rights, integrity and confidentiality of trial participants are protected. Although we rely on third parties to conduct our clinical trials, we, as the sponsor, remain responsible for ensuring that each of these clinical trials is conducted in accordance with its general investigational plan and protocol under legal and regulatory requirements, including GCP. Regulatory authorities enforce these GCP requirements through periodic inspections of trial sponsors, principal investigators and trial sites.

If any of our CROs, trial sites, principal investigators or other third parties fail to comply with applicable GCP requirements, other regulations, trial protocol or other requirements under their agreements with us, the quality or accuracy of the data they obtain may be compromised or unreliable, and the trials of our product candidates may not meet regulatory requirements. If trials do not meet regulatory requirements or if these third parties need to be replaced, the development of our product candidates may be delayed, suspended or terminated, regulatory authorities may require us to exclude the use of patient data from our approval applications or perform additional clinical trials before approving our marketing applications. Regulatory authorities may even reject our application for approval or refuse to accept our future applications for an extended time period. We cannot assure that upon inspection by a regulatory authority, such regulatory authority will determine that any of our clinical trials comply with GCP requirements or that our results may be used in support of our regulatory submissions. If any of these events occur, we may not be able to obtain regulatory approval for our product candidates on a timely basis, at a reasonable cost, or at all.

We currently rely, and expect to continue to rely, on third parties to conduct many aspects of our product manufacturing and distribution, and these third parties may not perform satisfactorily.*

We do not have operating manufacturing facilities at this time other than our roxadustat manufacturing facility in China, and our current commercial manufacturing facility plans in China are not expected to satisfy the requirements necessary to support development and commercialization outside of China. Other than in and for China specifically, we do not expect to independently manufacture our products. We currently rely, and expect to continue to rely, on third parties to scale-up, manufacture and supply roxadustat and our other product candidates outside of China. We also rely entirely on third parties for distribution in China. Risks arising from our reliance on third-party manufacturers include:

- reduced control and additional burdens of oversight as a result of using third-party manufacturers and distributors for all aspects of manufacturing activities, including regulatory compliance and quality control and quality assurance;
- termination of manufacturing agreements, termination fees associated with such termination, or nonrenewal of manufacturing agreements with third parties may negatively impact our planned development and commercialization activities;
- the possible misappropriation of our proprietary technology, including our trade secrets and know-how; and
- disruptions to the operations of our third-party manufacturers, distributors or suppliers unrelated to our product, including the merger, acquisition, or bankruptcy of a manufacturer or supplier or a catastrophic event, including disruption resulting from the COVID-19 pandemic, affecting our manufacturers, distributors or suppliers.

Any of these events could lead to development delays or failure to obtain regulatory approval or affect our ability to successfully commercialize our product candidates. Some of these events could be the basis for action by the FDA or another regulatory authority, including injunction, recall, seizure or total or partial suspension of production.

Table of Contents Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 450 of 1730

The facilities used by our contract manufacturers to manufacture our product candidates must pass inspections by the FDA and other regulatory authorities. Although, except for China, we do not control the manufacturing operations of, and expect to remain completely dependent on, our contract manufacturers for manufacture of drug substance and finished drug product, we are ultimately responsible for ensuring that our product candidates are manufactured in compliance with cGMP requirements. If our contract manufacturers cannot successfully manufacture material that conforms to our or our collaboration partners' specifications, or the regulatory requirements of the FDA or other regulatory authorities, we may not be able to secure and/or maintain regulatory approval for our product candidates and our development or commercialization plans may be delayed. In addition, we have no control over the ability of our contract manufacturers to maintain adequate quality control, quality assurance and qualified personnel. In addition, although our longer-term agreements are expected to provide for requirements to meet our quantity and quality requirements to manufacture our products candidates for clinical studies and commercial sale, we will have minimal direct control over the ability of our contract manufacturers to maintain adequate quality control, quality assurance and qualified personnel and we expect to rely on our audit rights to ensure that those qualifications are maintained to meet our requirements. If our contract manufacturers' facilities do not pass inspection by regulatory authorities, or if regulatory authorities do not approve these facilities for the manufacture of our products, or withdraw any such approval in the future, we would need to identify and qualify alternative manufacturing facilities, which would significantly impact our ability to develop, obtain regulatory approval for or market our products, if approved. Moreover, any failure of our thirdparty manufacturers, to comply with applicable regulations could result in sanctions being imposed on us or adverse regulatory consequences, including clinical holds, warnings or untitled letters, fines, injunctions, civil penalties, delays, suspension or withdrawal of approvals, license revocation, seizures or recalls of product candidates or products, operating restrictions and criminal prosecutions, any of which would be expected to significantly and adversely affect supplies of our products to us and our collaboration partners.

Other than for Catalent, our commercial third-party supplier of roxadustat drug product in the U.S. and Europe, most of our other third-party manufacturers may terminate their engagement with us at any time and we have not yet entered into any commercial supply agreements for the manufacture of drug substance, API, or drug products. With respect to roxadustat, AstraZeneca and Astellas have certain rights to assume manufacturing of roxadustat and the existence of those rights may limit our ability to enter into favorable long-term supply agreements, if at all, with other third-party manufacturers. In addition, our product candidates and any products that we may develop may compete with other product candidates and products for access and prioritization to manufacture. Certain third-party manufacturers may be contractually prohibited from manufacturing our product due to non-compete agreements with our competitors or a commitment to grant another party priority relative to our products. There are a limited number of third-party manufacturers that operate under cGMP and that might be capable of manufacturing to meet our requirements. Due to the limited number of third-party manufacturers with the contractual freedom, expertise, required regulatory approvals and facilities to manufacture our products on a commercial scale, identifying and qualifying a replacement third-party manufacturer would be expensive and time-consuming and may cause delay or interruptions in the production of our product candidates or products, which in turn may delay, prevent or impair our development and commercialization efforts.

We have a letter agreement with IRIX Pharmaceuticals, Inc. ("IRIX"), a third-party manufacturer that we have used in the past, pursuant to which we agreed to negotiate a single source manufacturing agreement that included a right of first negotiation for the cGMP manufacture of HIF-PH inhibitors, including roxadustat, provided that IRIX is able to match any third-party bids within 5%. The exclusive right to manufacture extends for five years after approval of an NDA for those compounds, and any agreement would provide that no minimum amounts would be specified until appropriate by forecast and that we and a commercialization partner would have the rights to contract with independent third parties that exceed IRIX's internal manufacturing capabilities or in the event that we or our commercialization partner determines for reasons of continuity of supply and security that such a need exists, provided that IRIX would supply no less than 65% of the product if it is able to provide this level of supply. Subsequent to the letter agreement, we and IRIX have entered into several additional service agreements. IRIX has requested in writing that we honor the letter agreement with respect to the single source manufacturing agreement, and if we were to enter into any such exclusive manufacturing agreement, there can be no assurance that IRIX will not assert a claim for right to manufacture roxadustat or that IRIX could manufacture roxadustat successfully and in accordance with applicable regulations for a commercial product and the specifications of our collaboration partners. In 2015, Patheon Pharmaceuticals Inc., a business unit of DPx Holdings B.V. ("Patheon"), acquired IRIX, and in 2017, ThermoFisher Scientific Inc. acquired Patheon.

If any third-party manufacturer terminates its engagement with us or fails to perform as agreed, we may be required to find replacement manufacturers, which would result in significant cost and delay to our development programs. Although we believe that there are several potential alternative manufacturers who could manufacture our product candidates, we may incur significant delays and added costs in identifying, qualifying and contracting with any such third party or potential second source manufacturer. In any event, with any third-party manufacturer we expect to enter into technical transfer agreements and share our know-how with the third-party manufacturer, which can be time-consuming and may result in delays. These delays could result in a suspension or delay of marketing roxadustat.

Certain of the components of our product candidates are acquired from single-source suppliers and have been purchased without long-term supply agreements. The loss of any of these suppliers, or their failure to supply us with supplies of sufficient quantity and quality to complete our drug substance or finished drug product of acceptable quality and an acceptable price, would materially and adversely affect our business.

We do not have an alternative supplier of certain components of our product candidates. We may be unable to enter into long-term commercial supply arrangements for some of our products, or do so on commercially reasonable terms, which could have a material adverse impact upon our business. In addition, we currently rely on our contract manufacturers to purchase from third-party suppliers some of the materials necessary to produce our product candidates. We do not have direct control over the acquisition of those materials by our contract manufacturers.

The logistics of our supply chain, which include shipment of materials and intermediates from countries such as China and India add additional time and risk (including risk of loss) to the manufacture of our product candidates. While we have in the past maintained sufficient inventory of materials, API, and drug product to meet our and our collaboration partners' needs for roxadustat to date, the lead-time and regulatory approvals required to source from and into countries outside of the U.S. increase the risk of delay and potential shortages of supply.

Risks Related to Our Intellectual Property

If our efforts to protect our proprietary technologies are not adequate, we may not be able to compete effectively in our market.*

We rely upon a combination of patents, trade secret protection, and contractual arrangements to protect the intellectual property related to our technologies. We will only be able to protect our products and proprietary information and technology by preventing unauthorized use by third parties to the extent that our patents, trade secrets, and contractual position allow us to do so. Any disclosure to or misappropriation by third parties of our trade secrets or confidential information could compromise our competitive position. Moreover, we are involved in, have in the past been involved in, and may in the future be involved in legal or administrative proceedings involving our intellectual property initiated by third parties, and which proceedings can result in significant costs and commitment of management time and attention. As our product candidates continue in development, third parties may attempt to challenge the validity and enforceability of our patents and proprietary information and technologies.

We also are involved in, have in the past been involved in, and may in the future be involved in initiating legal or administrative proceedings involving the product candidates and intellectual property of our competitors. These proceedings can result in significant costs and commitment of management time and attention, and there can be no assurance that our efforts would be successful in preventing or limiting the ability of our competitors to market competing products.

Composition-of-matter patents relating to the API are generally considered to be the strongest form of intellectual property protection for pharmaceutical products, as such patents provide protection not limited to any one method of use. Method-of-use patents protect the use of a product for the specified method(s), and do not prevent a competitor from making and marketing a product that is identical to our product for an indication that is outside the scope of the patented method. We rely on a combination of these and other types of patents to protect our product candidates, and there can be no assurance that our intellectual property will create and sustain the competitive position of our product candidates.

Biotechnology and pharmaceutical product patents involve highly complex legal and scientific questions and can be uncertain. Any patent applications that we own or license may fail to result in issued patents. Even if patents do successfully issue from our applications, third parties may challenge their validity or enforceability, which may result in such patents being narrowed, invalidated, or held unenforceable. Even if our patents and patent applications are not challenged by third parties, those patents and patent applications may not prevent others from designing around our claims and may not otherwise adequately protect our product candidates. If the breadth or strength of protection provided by the patents and patent applications we hold with respect to our product candidates is threatened, competitors with significantly greater resources could threaten our ability to commercialize our product candidates. Discoveries are generally published in the scientific literature well after their actual development, and patent applications in the U.S. and other countries are typically not published until 18 months after their filing, and in some cases are never published. Therefore, we cannot be certain that we or our licensors were the first to make the inventions claimed in our owned and licensed patents or patent applications, or that we or our licensors were the first to file for patent protection covering such inventions. Subject to meeting other requirements for patentability, for U.S. patent applications filed prior to March 16, 2013, the first to invent the claimed invention is entitled to receive patent protection for that invention while, outside the U.S., the first to file a patent application encompassing the invention is entitled to patent protection for the invention. The U.S. moved to a "first to file" system under the Leahy-Smith America Invents Act, effective March 16, 2013. This system also includes procedures for challenging issued patents and pending patent applications, which creates additional uncertainty. We may become involved in opposition or interference proceedings challenging our patents and patent applications or the patents and patent applications of others, and the outcome of any such proceedings are highly uncertain. An unfavorable outcome in any such proceedings could reduce the scope of or invalidate our patent rights, allow third parties to commercialize our technology and compete directly with us, or result in our inability to manufacture, develop or commercialize our product candidates without infringing the patent rights of others.

Table of Contents Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 452 of 1730

In addition to the protection afforded by patents, we seek to rely on trade secret protection and confidentiality agreements to protect proprietary know-how, information, or technology that is not covered by our patents. Although our agreements require all of our employees to acknowledge ownership by FibroGen of inventions conceived as a result of employment from the point of conception and, to the extent necessary, perfect such ownership by assignment, and we require all of our employees, consultants, advisors and any third parties who have access to our trade secrets, proprietary know-how and other confidential information and technology to enter into appropriate confidentiality agreements, we cannot be certain that our trade secrets, proprietary know-how and other confidential information and technology will not be subject to unauthorized disclosure or that our competitors will not otherwise gain access to or independently develop substantially equivalent trade secrets, proprietary know-how and other information and technology. Furthermore, the laws of some foreign countries, in particular, China, where we have operations, do not protect proprietary rights to the same extent or in the same manner as the laws of the U.S. As a result, we may encounter significant problems in protecting and defending our intellectual property globally. If we are unable to prevent unauthorized disclosure of our intellectual property related to our product candidates and technology to third parties, we may not be able to establish or maintain a competitive advantage in our market, which could materially adversely affect our business and operations.

Intellectual property disputes with third parties and competitors may be costly and time consuming, and may negatively affect our competitive position.*

Our commercial success may depend on our avoiding infringement of the patents and other proprietary rights of third parties as well as on enforcing our patents and other proprietary rights against third parties. Pharmaceutical and biotechnology intellectual property disputes are characterized by complex, lengthy and expensive litigation over patents and other intellectual property rights. We may initiate or become party to or be threatened with future litigation or other proceedings regarding intellectual property rights with respect to our product candidates and competing products.

As our product candidates progress toward commercialization, we or our collaboration partners may be subject to patent infringement claims from third parties. We attempt to ensure that our product candidates do not infringe third-party patents and other proprietary rights. However, the patent landscape in competitive product areas is highly complex, and there may be patents of third parties of which we are unaware that may result in claims of infringement. Accordingly, there can be no assurance that our product candidates do not infringe proprietary rights of third parties, and parties making claims against us may seek and obtain injunctive or other equitable relief, which could potentially block further efforts to develop and commercialize our product candidates including roxadustat or pamrevlumab. Any litigation involving defense against claims of infringement, regardless of the merit of such claims, would involve substantial litigation expense and would be a substantial diversion of management time.

We may consider administrative proceedings and other means for challenging third-party patents and patent applications. An unfavorable outcome in any such challenge could require us to cease using the related technology and to attempt to license rights to it from the prevailing third party, which may not be available on commercially reasonable terms, if at all, in which case our business could be harmed.

We intend, if necessary, to vigorously enforce our intellectual property in order to protect the proprietary position of our product candidates, including roxadustat and pamrevlumab. In addition, our collaboration partners who have been granted licenses to our patents may also have rights related to enforcement of those patents. Active efforts to enforce our patents by us or by our partners may include litigation, administrative proceedings, or both, depending on the potential benefits that might be available from those actions and the costs associated with undertaking those efforts against third parties. We carefully review and monitor publicly available information regarding products that may be competitive with our product candidates and assert our intellectual property rights where appropriate.

Third parties may also challenge our patents and patent applications, through interference, reexamination, *inter partes* review, and post-grant review proceedings before the U.S. Patent and Trademark Office ("USPTO") or through comparable proceedings in other territories. For example, various administrative and court challenges have been filed in several territories including the U.S., Europe, the U.K., Canada, and Japan, against our HIF anemia-related technologies patent portfolio. In the U.S., we have previously prevailed in administrative challenges to various patents in in this portfolio that are owned or exclusively licensed by FibroGen, maintaining our intellectual property in all relevant scope.

On April 20, 2020, in response to an invalidation action brought against certain FibroGen UK patents by Akebia, the UK court handed down a decision invalidating UK designations of European Patent Nos. 1463823, 1633333, 2298301, 2322153, and 2322155. The UK designation to European Patent No. 2289531 was held to be valid in amended form, but not infringed by Akebia. We and our partner Astellas have filed an appeal of the decision in the UK Court of Appeal. We note that narrowing or even revocation of any of the HIF anemia-related technology patents does not affect our exclusivity for roxadustat or our freedom-to-operate with respect to use of roxadustat for the treatment of anemia in these or other territories.

Table of Contents Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 453 of 1730

Oppositions have also recently been filed against our European Patent No. 2872488, which claims a crystalline form of roxadustat. Final resolution of the opposition proceedings will take considerable time, and we cannot be assured of the breadth of the claims that will remain in the '488 European patent or that the patent will not be revoked in its entirety.

Furthermore, there is a risk that any public announcements concerning the status or outcomes of intellectual property litigation or administrative proceedings may adversely affect the price of our stock. If securities analysts or our investors interpret such status or outcomes as negative or otherwise creating uncertainty, our common stock price may be adversely affected.

Our reliance on third parties and agreements with collaboration partners requires us to share our trade secrets, which increases the possibility that a competitor may discover them or that our trade secrets will be misappropriated or disclosed.

Our reliance on third-party contractors to develop and manufacture our product candidates is based upon agreements that limit the rights of the third parties to use or disclose our confidential information, including our trade secrets and know-how. Despite the contractual provisions, the need to share trade secrets and other confidential information increases the risk that such trade secrets and information are disclosed or used, even if unintentionally, in violation of these agreements. In the highly competitive markets in which our product candidates are expected to compete, protecting our trade secrets, including our strategies for addressing competing products, is imperative, and any unauthorized use or disclosure could impair our competitive position and may have a material adverse effect on our business and operations.

In addition, our collaboration partners are larger, more complex organizations than ours, and the risk of inadvertent disclosure of our proprietary information may be increased despite their internal procedures and contractual obligations in place with our collaboration partners. Despite our efforts to protect our trade secrets and other confidential information, a competitor's discovery of such trade secrets and information could impair our competitive position and have an adverse impact on our business.

We have an extensive worldwide patent portfolio. The cost of maintaining our patent protection is high and maintaining our patent protection requires continuous review and compliance in order to maintain worldwide patent protection. We may not be able to effectively maintain our intellectual property position throughout the major markets of the world.

The USPTO and foreign patent authorities require maintenance fees and payments as well as continued compliance with a number of procedural and documentary requirements. Noncompliance may result in abandonment or lapse of the subject patent or patent application, resulting in partial or complete loss of patent rights in the relevant jurisdiction. Non-compliance may result in reduced royalty payments for lack of patent coverage in a particular jurisdiction from our collaboration partners or may result in competition, either of which could have a material adverse effect on our business.

We have made, and will continue to make, certain strategic decisions in balancing costs and the potential protection afforded by the patent laws of certain countries. As a result, we may not be able to prevent third parties from practicing our inventions in all countries throughout the world, or from selling or importing products made using our inventions in and into the U.S. or other countries. Third parties may use our technologies in territories in which we have not obtained patent protection to develop their own products and, further, may infringe our patents in territories which provide inadequate enforcement mechanisms, even if we have patent protection. Such third-party products may compete with our product candidates, and our patents or other intellectual property rights may not be effective or sufficient to prevent them from competing.

The laws of some foreign countries do not protect proprietary rights to the same extent as do the laws of the U.S., and we may encounter significant problems in securing and defending our intellectual property rights outside the U.S.*

Many companies have encountered significant problems in protecting and defending intellectual property rights in certain countries. The legal systems of certain countries do not always favor the enforcement of patents, trade secrets, and other intellectual property rights, particularly those relating to pharmaceutical and biotechnology products, which could make it difficult for us to stop infringement of our patents, misappropriation of our trade secrets, or marketing of competing products in violation of our proprietary rights. In China, our intended establishment of significant operations will depend in substantial part on our ability to effectively enforce our intellectual property rights in that country. Proceedings to enforce our intellectual property rights in foreign countries could result in substantial costs and divert our efforts and attention from other aspects of our business, and could put our patents in these territories at risk of being invalidated or interpreted narrowly, or our patent applications at risk of not being granted, and could provoke third parties to assert claims against us. We may not prevail in all legal or other proceedings that we may initiate and, if we were to prevail, the damages or other remedies awarded, if any, may not be commercially meaningful. Accordingly, our efforts to enforce our intellectual property rights around the world may be inadequate to obtain a significant commercial advantage from the intellectual property that we develop or license.

Intellectual property rights do not address all potential threats to any competitive advantage we may have.

The degree of future protection afforded by our intellectual property rights is uncertain because intellectual property rights have limitations, and intellectual property rights may not adequately protect our business or permit us to maintain our competitive advantage. The following examples are illustrative:

- Others may be able to make compounds that are the same as or similar to our current or future product candidates but that are not covered by the claims of the patents that we own or have exclusively licensed.
- We or any of our licensors or strategic partners might not have been the first to make the inventions covered by the issued patent or pending patent application that we own or have exclusively licensed.
- We or any of our licensors or strategic partners might not have been the first to file patent applications covering certain of our inventions.
- Others may independently develop similar or alternative technologies or duplicate any of our technologies without infringing our intellectual property rights.
- The prosecution of our pending patent applications may not result in granted patents.
- Granted patents that we own or have exclusively licensed may not provide us with any competitive advantages, or may be held invalid or unenforceable, as a result of legal challenges by our competitors.
- Patent protection on our product candidates may expire before we are able to develop and commercialize the product, or before we are able to recover our investment in the product.
- Our competitors might conduct research and development activities in the U.S. and other countries that provide a safe harbor from patent infringement claims for such activities, as well as in countries in which we do not have patent rights, and may then use the information learned from such activities to develop competitive products for sale in markets where we intend to market our product candidates.

The existence of counterfeit pharmaceutical products in pharmaceutical markets may compromise our brand and reputation and have a material adverse effect on our business, operations and prospects.

Counterfeit products, including counterfeit pharmaceutical products, are a significant problem, particularly in China. Counterfeit pharmaceuticals are products sold or used for research under the same or similar names, or similar mechanism of action or product class, but which are sold without proper licenses or approvals, and are often lower cost, lower quality, different potency, or have different ingredients or formulations, and have the potential to damage the reputation for quality and effectiveness of the genuine product. Such products may be used for indications or purposes that are not recommended or approved or for which there is no data or inadequate data with regard to safety or efficacy. Such products divert sales from genuine products. If counterfeit pharmaceuticals illegally sold or used for research result in adverse events or side effects to consumers, we may be associated with any negative publicity resulting from such incidents. Consumers may buy counterfeit pharmaceuticals that are in direct competition with our pharmaceuticals, which could have an adverse impact on our revenues, business and results of operations. In addition, the use of counterfeit products could be used in non-clinical or clinical studies, or could otherwise produce undesirable side effects or adverse events that may be attributed to our products as well, which could cause us or regulatory authorities to interrupt, delay or halt clinical trials and could result in the delay or denial of regulatory approval by the FDA or other regulatory authorities and potential product liability claims. With respect to China, although the government has recently been increasingly active in policing counterfeit pharmaceuticals, there is not yet an effective counterfeit pharmaceutical regulation control and enforcement system in China. As a result, we may not be able to prevent third parties from selling or purporting to sell our products in China. The proliferation of counterfeit pharmaceuticals has grown in recent years and may continue to grow in the future. The existence of and any increase in the sales and production of counterfeit pharmaceuticals, or the technological capabilities of counterfeiters, could negatively impact our revenues, brand reputation, business and results of operations.

Risks Related to Government Regulation

The regulatory approval process is highly uncertain and we may not obtain regulatory approval for the commercialization of our product candidates.

The time required to obtain approval by the FDA and comparable foreign regulatory authorities is unpredictable, but typically takes many years following the commencement of preclinical studies and clinical trials and depends upon numerous factors, including the substantial discretion of the regulatory authorities. In addition, approval policies, regulations, or the type and amount of clinical data necessary to gain approval may change during the course of a product candidate's clinical development and may vary among jurisdictions. Except for roxadustat in China for patients on dialysis and not on dialysis, and Japan for patients on dialysis, we have not obtained regulatory approval for any product candidate, and it is possible that neither roxadustat nor pamrevlumab, nor any future product candidates we may discover, in-license or acquire and seek to develop in the future, will obtain regulatory approval in additional countries.

Table of Contents Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 455 of 1730

Our product candidates could fail to receive regulatory approval from the FDA or other regulatory authorities for many reasons, including:

- disagreement over the design or implementation of our clinical trials;
- failure to demonstrate that a product candidate is safe and effective for its proposed indication;
- failure of clinical trials to meet the level of statistical significance required for approval;
- failure to demonstrate that a product candidate's clinical and other benefits outweigh its safety risks;
- disagreement over our interpretation of data from preclinical studies or clinical trials;
- disagreement over whether to accept efficacy results from clinical trial sites outside the U.S. where the standard of care is potentially different from that in the U.S.;
- the insufficiency of data collected from clinical trials of our present or future product candidates to support the submission and filing of an NDA or other submission or to obtain regulatory approval:
- disapproval of the manufacturing processes or facilities of either our manufacturing plant or third party manufacturers with whom we contract for clinical and commercial supplies; or
- changes in the approval policies or regulations that render our preclinical and clinical data insufficient for approval.

The FDA or other regulatory authorities may require more information, including additional preclinical or clinical data to support approval, or different analyses, which may delay or prevent approval and our commercialization plans, or we may decide to abandon the development program altogether. Even if we do obtain regulatory approval, our product candidates may be approved for fewer or more limited indications than we request, approval may be contingent on the performance of costly post-marketing clinical trials, or approval may require labeling that does not include the labeling claims necessary or desirable for the successful commercialization of that product candidate. In addition, if our product candidates produce undesirable side effects or safety issues, the FDA may require the establishment of REMS or other regulatory authorities may require the establishment of a similar strategy, that may restrict distribution of our approved products, if any, and impose burdensome implementation requirements on us. Any of the foregoing scenarios could materially harm the commercial prospects for our product candidates.

Even if we believe our clinical trials are successful, regulatory authorities may not agree that our completed clinical trials provide adequate data on safety or efficacy. Approval by one regulatory authority does not ensure approval by any other regulatory authority. However, a failure or delay in obtaining regulatory approval in one country may have a negative effect on the regulatory process in others. We may not be able to file for regulatory approvals and even if we file we may not receive the necessary approvals to commercialize our product candidates in any market.

Our relationships with customers, physicians, and third-party payors are subject, directly or indirectly, to federal and state healthcare fraud and abuse laws, false claims laws, health information privacy and security laws, and other healthcare laws and regulations. If we are unable to comply, or have not fully complied, with such laws, we could face substantial penalties.

If we obtain approval in the U.S. for any of our product candidates, the regulatory requirements applicable to our operations, in particular our sales and marketing efforts, will increase significantly with respect to our operations and the potential for civil and criminal enforcement by the federal government and the states and foreign governments will increase with respect to the conduct of our business. The laws that may affect our operations in the U.S. include:

- the federal Anti-Kickback Statute, which prohibits, among other things, persons from knowingly and willfully soliciting, receiving, offering or paying remuneration, directly or indirectly, to induce, or in return for, the purchase or recommendation of an item or service reimbursable under a federal healthcare program, such as the Medicare and Medicaid programs;
- federal civil and criminal false claims laws and civil monetary penalty laws, which prohibit, among other things, individuals or entities from knowingly presenting, or causing to be presented, claims for payment from Medicare, Medicaid, or other third-party payors that are false or fraudulent;
- the Health Insurance Portability and Accountability Act of 1996 ("HIPAA"), which created new federal criminal statutes that prohibit executing a scheme to defraud any healthcare benefit program and making false statements relating to healthcare matters;

Table of Contents Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 456 of 1730

- HIPAA, as amended by Health Information Technology and Clinical Health Act, and its implementing regulations, which imposes certain requirements relating to the privacy, security, and transmission of individually identifiable health information;
- the federal physician sunshine requirements under the Patient Protection and Affordable Care Act ("PPACA"), which requires manufacturers of drugs, devices, biologics, and medical supplies to report annually to the Centers for Medicare and Medicaid Services ("CMS"), information related to payments and other transfers of value to physicians, other healthcare providers, and teaching hospitals, and ownership and investment interests held by physicians and other healthcare providers and their immediate family members;
- foreign and state law equivalents of each of the above federal laws, such as the U.S. Foreign Corrupt Practices Act ("FCPA"), anti-kickback and false claims laws that may apply to items or services reimbursed by any third-party payor, including commercial insurers; state laws that require pharmaceutical companies to comply with the pharmaceutical industry's voluntary compliance guidelines and the applicable compliance guidance promulgated by the federal government, or otherwise restrict payments that may be made to healthcare providers and other potential referral sources; state laws that require drug manufacturers to report information related to payments and other transfers of value to physicians and other healthcare providers or marketing expenditures; and state laws governing the privacy and security of health information in certain circumstances, many of which differ from each other in significant ways, thus complicating compliance efforts; and
- the Trade Agreements Act ("TAA"), which requires that drugs sold to the U.S. Government must be manufactured in the U.S. or in TAA approved and designated countries. Drugs manufactured in countries not approved under the TAA, may not be sold to the U.S. without specific regulatory approval. We have little experience with this regulation and there is a risk that drugs made from Chinese-made API may not be sold to an entity of the U.S. such as the Veterans Health Administration ("VA") due to our inability to obtain regulatory approval. While there have been recent VA policy changes that appear to allow for sale of drugs from non-TAA approved countries, this policy may change or there may be additional policies or legislation that affect our ability to sell drug to the U.S. Government.

The scope of these laws and our lack of experience in establishing the compliance programs necessary to comply with this complex and evolving regulatory environment increases the risks that we may unknowingly violate the applicable laws and regulations. If our operations are found to be in violation of any of such laws or any other governmental regulations that apply to us, we may be subject to penalties, including civil and criminal penalties, damages, fines, the curtailment or restructuring of our operations, the exclusion from participation in federal and state healthcare programs and imprisonment, any of which could materially adversely affect our ability to operate our business and our financial results.

Even if resolved in our favor, litigation or other legal proceedings relating to healthcare laws and regulations may cause us to incur significant expenses and could distract our technical and management personnel from their normal responsibilities. In addition, there could be public announcements of the results of hearings, motions or other interim proceedings or developments. If securities analysts or investors perceive these results to be negative, it could have a substantial adverse effect on the price of our common shares. Such litigation or proceedings could substantially increase our operating losses and reduce the resources available for development, manufacturing, sales, marketing or distribution activities. Uncertainties resulting from the initiation and continuation of litigation or other proceedings relating to applicable healthcare laws and regulations could have a material adverse effect on our ability to compete in the marketplace.

We are subject to laws and regulations governing corruption, which will require us to develop, maintain, and implement costly compliance programs.

We must comply with a wide range of laws and regulations to prevent corruption, bribery, and other unethical business practices, including the FCPA, antibribery and anti-corruption laws in other countries, particularly China. The implementation and maintenance of compliance programs is costly and such programs may be difficult to enforce, particularly where reliance on third parties is required.

Anti-bribery laws prohibit us, our employees, and some of our agents or representatives from offering or providing any personal benefit to covered government officials to influence their performance of their duties or induce them to serve interests other than the missions of the public organizations in which they serve. Certain commercial bribery rules also prohibit offering or providing any personal benefit to employees and representatives of commercial companies to influence their performance of their duties or induce them to serve interests other than their employers. The FCPA also obligates companies whose securities are listed in the U.S. to comply with certain accounting provisions requiring us to maintain books and records that accurately and fairly reflect all transactions of the corporation, including international subsidiaries, and devise and maintain an adequate system of internal accounting controls for international operations. The anti-bribery provisions of the FCPA are enforced primarily by the Department of Justice. The SEC is involved with enforcement of the books and records provisions of the FCPA.

Compliance with these anti-bribery laws is expensive and difficult, particularly in countries in which corruption is a recognized problem. In addition, the anti-bribery laws present particular challenges in the pharmaceutical industry because in many countries including China, hospitals are state-owned or operated by the government, and doctors and other hospital employees are considered foreign government officials. Furthermore, in certain countries (China in particular), hospitals and clinics are permitted to sell pharmaceuticals to their patients and are primary or significant distributors of pharmaceuticals. Certain payments to hospitals in connection with clinical studies, procurement of pharmaceuticals and other work have been deemed to be improper payments to government officials that have led to vigorous anti-bribery law enforcement actions and heavy fines in multiple jurisdictions, particularly in the U.S. and China.

It is not always possible to identify and deter violations, and the precautions we take to detect and prevent this activity may not be effective in controlling unknown or unmanaged risks or losses or in protecting us from governmental investigations or other actions or lawsuits stemming from a failure to be in compliance with such laws or regulations.

In the pharmaceutical industry, corrupt practices include, among others, acceptance of kickbacks, bribes or other illegal gains or benefits by the hospitals and medical practitioners from pharmaceutical manufacturers, distributors or their third-party agents in connection with the prescription of certain pharmaceuticals. If our employees, affiliates, distributors or third-party marketing firms violate these laws or otherwise engage in illegal practices with respect to their sales or marketing of our products or other activities involving our products, we could be required to pay damages or heavy fines by multiple jurisdictions where we operate, which could materially and adversely affect our financial condition and results of operations. The Chinese government has also sponsored anti-corruption campaigns from time to time, which could have a chilling effect on any future marketing efforts by us to new hospital customers. There have been recent occurrences in which certain hospitals have denied access to sales representatives from pharmaceutical companies because the hospitals wanted to avoid the perception of corruption. If this attitude becomes widespread among our potential customers, our ability to promote our products to hospitals may be adversely affected.

As we expand our operations in China and other jurisdictions internationally, we will need to increase the scope of our compliance programs to address the risks relating to the potential for violations of the FCPA and other anti-bribery and anti-corruption laws. Our compliance programs will need to include policies addressing not only the FCPA, but also the provisions of a variety of anti-bribery and anti-corruption laws in multiple foreign jurisdictions, including China, provisions relating to books and records that apply to us as a public company, and include effective training for our personnel throughout our organization. The creation and implementation of anti-corruption compliance programs is costly and such programs are difficult to enforce, particularly where reliance on third parties is required. Violation of the FCPA and other anti-corruption laws can result in significant administrative and criminal penalties for us and our employees, including substantial fines, suspension or debarment from government contracting, prison sentences, or even the death penalty in extremely serious cases in certain countries. The SEC also may suspend or bar us from trading securities on U.S. exchanges for violation of the FCPA's accounting provisions. Even if we are not ultimately punished by government authorities, the costs of investigation and review, distraction of our personnel, legal defense costs, and harm to our reputation could be substantial and could limit our profitability or our ability to develop or commercialize our product candidates. In addition, if any of our competitors are not subject to the FCPA, they may engage in practices that will lead to their receipt of preferential treatment from foreign hospitals and enable them to secure business from foreign hospitals in ways that are unavailable to us.

The impact of recent U.S. healthcare reform, its potential partial or full repeal, and other changes in the healthcare industry and in healthcare spending is currently unknown, and may adversely affect our business model.

The commercial potential for our approved products could be affected by changes in healthcare spending and policy in the U.S. and abroad. We operate in a highly regulated industry and new laws, regulations or judicial decisions, or new interpretations of existing laws, regulations or decisions, related to healthcare availability, the method of delivery or payment for healthcare products and services could negatively impact our business, operations and financial condition.

In the U.S., the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 ("MMA") altered Medicare coverage and payments for pharmaceutical products. The legislation expanded Medicare coverage for drug purchases by the elderly and introduced a new reimbursement methodology based on average sales prices for physician-administered drugs. The MMA also provided authority for limiting the number of drugs that will be covered in any therapeutic class and as a result, we expect that there will be additional pressure to reduce costs. For example, the CMS in implementing the MMA has enacted regulations that reduced capitated payments to dialysis providers. These cost reduction initiatives and other provisions of the MMA could decrease the scope of coverage and the price that may be received for any approved dialysis products and could seriously harm our business and financial condition. While the MMA applies only to drug benefits for Medicare beneficiaries, private payors often follow Medicare coverage policies and payment limitations in setting their own reimbursement rates, and any reduction in reimbursement that results from the MMA may cause a similar reduction in payments from private payors. Similar regulations or reimbursement policies have been enacted in many international markets that could similarly impact the commercial potential for our products.

Under the Medicare Improvements for Patients and Providers Act ("MIPPA"), a basic case-mix adjusted composite, or bundled, payment system commenced in January 2011 and transitioned fully by January 2014 to a single reimbursement rate for drugs and all services furnished by renal dialysis centers for Medicare beneficiaries with end-stage renal disease. Specifically, under MIPPA the bundle now covers drugs, services, lab tests and supplies under a single treatment base rate for reimbursement by the CMS based on the average cost per treatment, including the cost of ESAs and IV iron doses, typically without adjustment for usage. It is unknown whether roxadustat, if approved in the U.S., will be included in the payment bundle. Under MIPPA, agents that have no IV equivalent in the bundle are currently expected to be excluded from the bundle until 2025. If roxadustat were included in the bundle, it may reduce the price that could be charged for roxadustat, and therefore potentially limit our profitability. Based on roxadustat's differentiated mechanism of action and therapeutic effects, and discussions with our collaboration partner, we currently believe that roxadustat might not be included in the bundle and would instead be eligible for a Transitional Drug Add-on Payment Adjustment ("TDAPA") for a 24-month period. After this 24-month period, CMS would determine if roxadustat should be included in the bundle and, if so, what changes to end-stage renal disease prospective payment system reimbursement should be made. If roxadustat is not included in the bundle after the TDAPA period, and would therefore be reimbursed outside of the bundle, it may potentially limit further market penetration of roxadustat.

In March 2010, the Patient Protection and Affordable Care Act of 2010, as amended by the Health Care and Education Reconciliation Act of 2010, (collectively, the "PPACA"), was passed, which substantially changed the way healthcare is financed by both governmental and private payors in the U.S. There remain judicial and Congressional challenges to certain aspects of the PPACA as well as efforts by the Trump administration to repeal or replace certain aspects of the PPACA. For example, the Tax Cuts and Jobs Act of 2017, (the "Tax Act"), was enacted, which includes a provision that repealed, effective January 1, 2019, the tax-based shared responsibility payment imposed by the PPACA on certain individuals who fail to maintain qualifying health coverage for all or part of a year that is commonly referred to as the "individual mandate." In addition, the 2020 federal spending package permanently eliminates, effective January 1, 2020, the PPACA-mandated "Cadillac" tax on high-cost employer-sponsored health coverage and medical device tax and, effective January 1, 2021, also eliminates the health insurer tax. Additionally, on December 15, 2018, a Texas U.S. District Court Judge ruled that the PPACA is unconstitutional in its entirety because the "individual mandate" was repealed by Congress as part of the Tax Act. Additionally, on December 18, 2019, the U.S. Court of Appeals for the 5th Circuit upheld the District Court ruling that the individual mandate was unconstitutional and remanded the case back to the District Court to determine whether the remaining provisions of the PPACA are invalid as well. It is unclear how this decision, future decisions, subsequent appeals, and other efforts to repeal and replace the PPACA will impact the PPACA and our business.

Table of Contents Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 459 of 1730

Further, in the U.S. there has been heightened governmental scrutiny over the manner in which manufacturers set prices for their marketed products, which has resulted in several Congressional inquiries and proposed and enacted federal and state legislation designed to, among other things, bring more transparency to drug pricing, reduce the cost of prescription drugs under government payor programs, and review the relationship between pricing and manufacturer patient programs. At the federal level, the Trump administration's budget proposals for fiscal year 2020 contains further drug price control measures that could be enacted during the budget process or in other future legislation. In addition, the Trump administration released a "Blueprint" to lower drug prices and reduce out of pocket costs of drugs that contains additional proposals to increase manufacturer competition, increase the negotiating power of certain federal healthcare programs, incentivize manufacturers to lower the list price of their products, and reduce the out of pocket costs of drug products paid by consumers. The Department of Health and Human Services has solicited feedback on some of these measures and has implemented others under its existing authority. While some of these measures may require additional authorization to become effective, the U.S. Congress and the Trump administration have indicated that they will continue to seek new legislative and/or administrative measures to control drug costs. At the state level, legislatures have increasingly passed legislation and implemented regulations designed to control pharmaceutical and biological product pricing, including price or patient reimbursement constraints, discounts, restrictions on certain product access and marketing cost disclosure and transparency measures, and, in some cases, designed to encourage importation from other countries and bulk purchasing. We expect that additional U.S. healthcare reform measures will be adopted in the future, any of which could limit the amount

Roxadustat is considered a Class 2 substance on the 2019 World Anti-Doping Agency Prohibited List that could limit sales and increase security and distribution costs for us and our partners.*

Roxadustat is considered a Class 2 substance on the World Anti-Doping Agency ("WADA") Prohibited List. There are enhanced security and distribution procedures we and our collaboration partners and third-party contractors will have to take to limit the risk of loss of product in the supply chain. As a result, our distribution, manufacturing and sales costs for roxadustat, as well as for our partners, will be increased which will reduce profitability. In addition, there is a risk of reduced sales due to patient access to this drug.

Our employees may engage in misconduct or other improper activities, including noncompliance with regulatory standards and requirements, which could result in significant liability for us and harm our reputation.

We are exposed to the risk of employee fraud or other misconduct, including intentional failure to:

- comply with FDA regulations or similar regulations of comparable foreign regulatory authorities;
- provide accurate information to the FDA or comparable foreign regulatory authorities;
- comply with manufacturing standards we have established;
- comply with privacy laws protecting personal information;
- comply with federal and state healthcare fraud and abuse laws and regulations and similar laws and regulations established and enforced by comparable foreign regulatory authorities;
- comply with the FCPA and other anti-bribery laws;
- report financial information or data accurately; or
- disclose unauthorized activities to us.

Employee misconduct could also involve the improper use of information obtained in the course of clinical trials, which could result in regulatory sanctions, delays in clinical trials, or serious harm to our reputation. We have adopted a code of conduct for our directors, officers and employees, but it is not always possible to identify and deter employee misconduct. The precautions we take to detect and prevent this activity may not be effective in controlling unknown or unmanaged risks or losses or in protecting us from governmental investigations or other actions or lawsuits stemming from a failure to be in compliance with such laws or regulations. If any such actions are instituted against us, and we are not successful in defending ourselves or asserting our rights, those actions could harm our business, results of operations, financial condition and cash flows, including through the imposition of significant fines or other sanctions.

If we fail to comply with environmental, health and safety laws and regulations, we could become subject to fines or penalties or incur costs that could harm our business.

We are subject to numerous environmental, health and safety laws and regulations, including those governing laboratory procedures and the handling, use, storage, treatment and disposal of hazardous materials and wastes. Our operations involve the use of hazardous and flammable materials, including chemicals and biological materials. Our operations also produce hazardous waste products. We contract with third parties for the disposal of these materials and wastes. We cannot eliminate the risk of contamination or injury from these materials. In the event of contamination or injury resulting from our use of hazardous materials, we could be held liable for any resulting damages, and any liability could exceed our resources. We also could incur significant costs associated with civil or criminal fines and penalties for failure to comply with such laws and regulations. We do not maintain insurance for environmental liability or toxic tort claims that may be asserted against us in connection with our storage or disposal of biological, hazardous or radioactive materials.

In addition, we may incur substantial costs in order to comply with current or future environmental, health and safety laws and regulations applicable to our operations in the U.S. and foreign countries. These current or future laws and regulations may impair our research, development or manufacturing efforts. Our failure to comply with these laws and regulations also may result in substantial fines, penalties or other sanctions.

Risks Related to Our International Operations

We are establishing international operations and seeking approval to commercialize our product candidates outside of the U.S., in particular in China, and a number of risks associated with international operations could materially and adversely affect our business.*

We expect to be subject to a number of risks related with our international operations, many of which may be beyond our control. These risks include:

- different regulatory requirements for drug approvals in different countries;
- different standards of care in various countries that could complicate the evaluation of our product candidates;
- different U.S. and foreign drug import and export rules;
- reduced protection for intellectual property rights in certain countries;
- changes in tariffs, trade barriers and regulatory requirements;
- different reimbursement systems and different competitive drugs indicated to treat the indications for which our product candidates are being developed;
- economic weakness, including inflation, or political instability in particular foreign economies and markets;
- compliance with tax, employment, immigration and labor laws for employees living or traveling abroad;
- compliance with the FCPA, and other anti-corruption and anti-bribery laws;
- U.S. and foreign taxes, including income, excise, customs, consumption, withholding, and payroll taxes;
- foreign currency fluctuations, which could result in increased operating costs and expenses and reduced revenues, and other obligations incident to doing business in another country;
- workforce uncertainty in countries where labor unrest is more common than in the U.S.;
- production shortages resulting from any events affecting raw material supply or manufacturing capabilities abroad;
- a reliance on CROs, clinical trial sites, principal investigators and other third parties that may be less experienced with clinical trials or have different methods of performing such clinical trials than we are used to in the U.S.;
- potential liability resulting from development work conducted by foreign distributors; and
- business interruptions resulting from geopolitical actions specific to an international region, including war and terrorism, or natural disasters, including the differing impact of the COVID-19 pandemic on each region.

The pharmaceutical industry in China is highly regulated and such regulations are subject to change.

The pharmaceutical industry in China is subject to comprehensive government regulation and supervision, encompassing the approval, registration, manufacturing, packaging, licensing and marketing of new drugs. Refer to "Business — Government Regulation — Regulation in China" for a discussion of the regulatory requirements that are applicable to our current and planned business activities in China. In recent years, the regulatory framework in China regarding the pharmaceutical industry has undergone significant changes, and we expect that it will continue to undergo significant changes. For example, the Chinese government has implemented regulations that impact distribution of pharmaceutical products in China. These regulations generally require that at most two invoices may be issued throughout the distribution chain. Failure to comply with the "Two-Invoices" regulations would prevent us from accessing the market in China. We are establishing a jointly owned Distribution Entity with AstraZeneca to manage distribution in China, and there are complexities involved in establishing proper systems to perform distribution with which we have limited experience. We expect to continue to manage distribution in certain provinces in China. We have limited experience managing distribution of pharmaceutical products, and this new distribution structure may impose higher costs or limit or delay our ability to sell products to our principal customers, and may limit the near term sales of our products. Any other such changes or amendments may result in increased compliance costs to our business or cause delays in or prevent the successful development or commercialization of our product candidates in China. Any failure by us or our partners to maintain compliance with applicable laws and regulations or obtain and maintain required licenses and permits may result in the suspension or termination of our business activities in China.

We plan to use our own manufacturing facilities in China to produce roxadustat API and roxadustat drug product. As an organization, we have limited experience in the construction, licensure, and operation of a manufacturing plant, and accordingly we cannot assure you we will be able to continually meet regulatory requirements to operate our plant and to sell our products.*

We have two manufacturing facilities in China, with one located in Beijing and the other in Cangzhou, Hebei. However, as an organization, we have limited experience licensing and operating commercial manufacturing facilities.

We will be obligated to comply with continuing cGMP requirements and there can be no assurance that we will maintain all of the appropriate licenses required to manufacture our product candidates for clinical and commercial use in China. In addition, we and our product suppliers must continually spend time, money and effort in production, record-keeping and quality assurance and appropriate controls in order to ensure that any products manufactured in our facilities meet applicable specifications and other requirements for product safety, efficacy and quality and there can be no assurance that our efforts will continue to be successful in meeting these requirements.

Manufacturing facilities in China are subject to periodic unannounced inspections by the NMPA and other regulatory authorities. We expect to depend on these facilities for our product candidates and business operations in China. Natural disasters or other unanticipated catastrophic events, including power interruptions, water shortages, storms, fires, pandemics (including the COVID-19 pandemic), earthquakes, terrorist attacks, government appropriation of our facilities, and wars, could significantly impair our ability to operate our manufacturing facilities. Certain equipment, records and other materials located in these facilities would be difficult to replace or would require substantial replacement lead-time that would impact our ability to successfully commercialize our product candidates in China. The occurrence of any such event could materially and adversely affect our business, financial condition, results of operations, cash flows and prospects.

In addition to manufacturing, we are responsible for pharmacovigilance, medical affairs, and management of the third-party distribution logistics for roxadustat in China. We have no experience in these areas as a company, and accordingly we cannot assure you we will be able to meet regulatory requirements or operate in these capacities successfully.

We are responsible for commercial manufacturing, pharmacovigilance, medical affairs, and management of the third-party distribution logistics (with AstraZeneca through the Distribution Entity) for roxadustat commercial activities in China. While we have been increasing our staffing in these areas, as a company, we have no experience managing or operating these functions for a commercial product and there can be no guarantee that we will do so efficiently or effectively. Mistakes or delays in these areas could limit our ability to successfully commercialize roxadustat in China, could limit our eventual market penetration, sales and profitability, and could subject us to significant liability in China.

We and our collaboration partner in China, AstraZeneca, may experience difficulties in successfully generating sales of roxadustat in China.

We and AstraZeneca have a profit sharing arrangement with respect to roxadustat in China and any difficulties we may experience in generating sales will affect our bottom line. Difficulties may be related to our ability to maintain reasonable pricing and reimbursement, obtain hospital listing, or other difficulties related to distribution, marketing, and sales efforts in China. For example, our current National Reimbursement Drug List reimbursement pricing is effective for a standard two-year period (between January 1, 2020 to December 31, 2021), after which time we will have to renegotiate a new price for roxadustat, which may be lower. Sales of roxadustat in China may be limited due to the complex nature of the healthcare system, low average personal income, pricing controls, still developing infrastructure and potentially rapid competition from other products. The hospital listing process is critical to roxadustat's near-term commercial success in China and may take many years to obtain the majority of hospital listings.

The retail prices of any product candidates that we develop may be subject to control, including periodic downward adjustment, by Chinese government authorities.

The price for pharmaceutical products is highly regulated in China, both at the national and provincial level. Price controls may reduce prices to levels significantly below those that would prevail in less regulated markets or limit the volume of products that may be sold, either of which may have a material and adverse effect on potential revenues from sales of roxadustat in China. Moreover, the process and timing for the implementation of price restrictions is unpredictable, which may cause potential revenues from the sales of roxadustat to fluctuate from period to period.

If our planned business activities in China fall within a restricted category under the China Catalog for Guidance for Foreign Investment, we will need to operate in China through a variable interest entity ("VIE") structure.

The China Catalog for Guidance for Foreign Investment sets forth the industries and sectors that the Chinese government encourages and restricts with respect to foreign investment and participation. The Catalog for Guidance for Foreign Investment is subject to revision from time to time by the China Ministry of Commerce. While we currently do not believe the development and marketing of roxadustat falls within a restricted category under the Catalog for Guidance for Foreign Investment, if roxadustat does fall under such a restricted category, we will need to operate in China through a VIE structure. A VIE structure involves a wholly foreign-owned enterprise that would control and receive the economic benefits of a domestic Chinese company through various contractual relationships. Such a structure would subject us to a number of risks that may have an adverse effect on our business, including that the Chinese government may determine that such contractual arrangements do not comply with applicable regulations, Chinese tax authorities may require us to pay additional taxes, shareholders of our VIEs may have potential conflicts of interest with us, and we may lose the ability to use and enjoy assets held by our VIEs that are important to the operations of our business if such entities go bankrupt or become subject to dissolution or liquidation proceedings. VIE structures in China have come under increasing scrutiny from accounting firms and the Securities and Exchange Commission ("SEC") staff. If we do attempt to use a VIE structure and are unsuccessful in structuring it so as to qualify as a VIE, we would not be able to consolidate the financial statements of the VIE with our financial statements, which could have a material adverse effect on our operating results and financial condition.

FibroGen (China) Medical Technology Development Co., Ltd. ("FibroGen Beijing") would be subject to restrictions on paying dividends or making other payments to us, which may restrict our ability to satisfy our liquidity requirements.*

We plan to conduct all of our business in China through FibroGen China Anemia Holdings, Ltd. and FibroGen Beijing. We may rely on dividends and royalties paid by FibroGen Beijing for a portion of our cash needs, including the funds necessary to service any debt we may incur and to pay our operating costs and expenses. The payment of dividends by FibroGen Beijing is subject to limitations. Regulations in China currently permit payment of dividends only out of accumulated profits as determined in accordance with accounting standards and regulations in China. FibroGen Beijing is not permitted to distribute any profits until losses from prior fiscal years have been recouped and in any event must maintain certain minimum capital requirements. FibroGen Beijing is also required to set aside at least 10.0% of its after-tax profit based on Chinese accounting standards each year to its statutory reserve fund until the cumulative amount of such reserves reaches 50.0% of its registered capital. Statutory reserves are not distributable as cash dividends. In addition, if FibroGen Beijing incurs debt on its own behalf in the future, the agreements governing such debt may restrict its ability to pay dividends or make other distributions to us. As of June 30, 2020, approximately \$11.9 million of our cash and cash equivalents is held in China.

Any capital contributions from us to FibroGen Beijing must be approved by the Ministry of Commerce in China, and failure to obtain such approval may materially and adversely affect the liquidity position of FibroGen Beijing.

The Ministry of Commerce in China or its local counterpart must approve the amount and use of any capital contributions from us to FibroGen Beijing, and there can be no assurance that we will be able to complete the necessary government registrations and obtain the necessary government approvals on a timely basis, or at all. If we fail to do so, we may not be able to contribute additional capital to fund our Chinese operations, and the liquidity and financial position of FibroGen Beijing may be materially and adversely affected.

We may be subject to currency exchange rate fluctuations and currency exchange restrictions with respect to our operations in China, which could adversely affect our financial performance.

Most of our product sales will occur in local Chinese currency and our operating results will be subject to volatility from currency exchange rate fluctuations. To date, we have not hedged against the risks associated with fluctuations in exchange rates and, therefore, exchange rate fluctuations could have an adverse impact on our future operating results. Changes in value of the Renminbi against the U.S. dollar, Euro and other currencies is affected by, among other things, changes in China's political and economic conditions. Currently, the Renminbi is permitted to fluctuate within a narrow and managed band against a basket of certain foreign currencies. Any significant currency exchange rate fluctuations may have a material adverse effect on our business and financial condition.

In addition, the Chinese government imposes controls on the convertibility of the Renminbi into foreign currencies and the remittance of foreign currency out of China for certain transactions. Shortages in the availability of foreign currency may restrict the ability of FibroGen Beijing to remit sufficient foreign currency to pay dividends or other payments to us, or otherwise satisfy their foreign currency-denominated obligations. Under existing Chinese foreign exchange regulations, payments of current account items, including profit distributions, interest payments and balance of trade, can be made in foreign currencies without prior approval from the State Administration of Foreign Exchange ("SAFE") by complying with certain procedural requirements. However, approval from SAFE or its local branch is required where Renminbi is to be converted into foreign currency and remitted out of China to pay capital expenses such as the repayment of loans denominated in foreign currencies. The Chinese government may also at its discretion restrict access in the future to foreign currencies for current account transactions. If the foreign exchange control system prevents us from obtaining sufficient foreign currency to satisfy our operational requirements, our liquidity and financial position may be materially and adversely affected.

Because FibroGen Beijing's funds are held in banks that do not provide insurance, the failure of any bank in which FibroGen Beijing deposits its funds could adversely affect our business.

Banks and other financial institutions in China do not provide insurance for funds held on deposit. As a result, in the event of a bank failure, FibroGen Beijing may not have access to funds on deposit. Depending upon the amount of money FibroGen Beijing maintains in a bank that fails, its inability to have access to cash could materially impair its operations.

We may be subject to tax inefficiencies associated with our offshore corporate structure.*

The tax regulations of the U.S. and other jurisdictions in which we operate are extremely complex and subject to change. New laws, new interpretations of existing laws, such as the Base Erosion Profit Shifting project initiated by the Organization for Economic Co-operation and Development, and any legislation proposed by the relevant taxing authorities, or limitations on our ability to structure our operations and intercompany transactions may lead to inefficient tax treatment of our revenue, profits, royalties, and distributions, if any are achieved.

In addition, we and our foreign subsidiaries have various intercompany transactions. We may not be able to obtain certain benefits under relevant tax treaties to avoid double taxation on certain transactions among our subsidiaries. If we are not able to avail ourselves to the tax treaties, we could be subject to additional taxes, which could adversely affect our financial condition and results of operations.

On December 22, 2017, the Tax Cuts and Jobs Act (Tax Act) was enacted which instituted various changes to the taxation of multinational corporations. Since inception, various regulations and interpretations have been issued by governing authorities and we continue to examine the impacts to our business, which could potentially have a material adverse effect on our business, results of operations or financial conditions.

Our foreign operations, particularly those in China, are subject to significant risks involving the protection of intellectual property.

We seek to protect the products and technology that we consider important to our business by pursuing patent applications in China and other countries, relying on trade secrets or pharmaceutical regulatory protection or employing a combination of these methods. We note that the filing of a patent application does not mean that we will be granted a patent, or that any patent eventually granted will be as broad as requested in the patent application or will be sufficient to protect our technology. There are a number of factors that could cause our patents, if granted, to become invalid or unenforceable or that could cause our patent applications not to be granted, including known or unknown prior art, deficiencies in the patent application, or lack of originality of the technology. Furthermore, the terms of our patents are limited. The patents we hold and the patents that may be granted from our currently pending patent applications have, absent any patent term adjustment or extension, a twenty-year protection period starting from the date of application.

Intellectual property rights and confidentiality protections in China may not be as effective as those in the U.S. or other countries for many reasons, including lack of procedural rules for discovery and evidence, low damage awards, and lack of judicial independence. Implementation and enforcement of China intellectual property laws have historically been deficient and ineffective and may be hampered by corruption and local protectionism. Policing unauthorized use of proprietary technology is difficult and expensive, and we may need to resort to litigation to enforce or defend patents issued to us or to determine the enforceability and validity of our proprietary rights or those of others. The experience and capabilities of China courts in handling intellectual property litigation varies and outcomes are unpredictable. An adverse determination in any such litigation could materially impair our intellectual property rights and may harm our business.

Uncertainties with respect to the China legal system could have a material adverse effect on us.

The legal system of China is a civil law system primarily based on written statutes. Unlike in a common law system, prior court decisions may be cited for reference but are not binding. Because the China legal system continues to rapidly evolve, the interpretations of many laws, regulations and rules are not always uniform and enforcement of these laws, regulations and rules involve uncertainties, which may limit legal protections available to us. Moreover, decision makers in the China judicial system have significant discretion in interpreting and implementing statutory and contractual terms, which may render it difficult for FibroGen Beijing to enforce the contracts it has entered into with our business partners, customers and suppliers. Different government departments may have different interpretations of certain laws and regulations, and licenses and permits issued or granted by one government authority may be revoked by a higher government authority at a later time. Navigating the uncertainty and change in the China legal system will require the devotion of significant resources and time, and there can be no assurance that our contractual and other rights will ultimately be enforced.

Changes in China's economic, political or social conditions or government policies could have a material adverse effect on our business and operations.

Chinese society and the Chinese economy continue to undergo significant change. Changes in the regulatory structure, regulations, and economic policies of the Chinese government could have a material adverse effect on the overall economic growth of China, which could adversely affect our ability to conduct business in China. The Chinese government continues to adjust economic policies to promote economic growth. Some of these measures benefit the overall Chinese economy, but may also have a negative effect on us. For example, our financial condition and results of operations in China may be adversely affected by government control over capital investments or changes in tax regulations. As the Chinese pharmaceutical industry grows and evolves, the Chinese government may also implement measures to change the regulatory structure and structure of foreign investment in this industry. We are unable to predict the frequency and scope of such policy changes and structural changes, any of which could materially and adversely affect FibroGen Beijing's development and commercialization timelines, liquidity, access to capital, and its ability to conduct business in China. Any failure on our part to comply with changing government regulations and policies could result in the loss of our ability to develop and commercialize our product candidates in China. In addition, the changing government regulations and policies could result in delays and cost increases to our development, manufacturing, approval, and commercialization timelines in China.

Our operations in China subject us to various Chinese labor and social insurance laws, and our failure to comply with such laws may materially and adversely affect our business, financial condition and results of operations.

We are subject to China Labor Contract Law, which provides strong protections for employees and imposes many obligations on employers. The Labor Contract Law places certain restrictions on the circumstances under which employers may terminate labor contracts and require economic compensation to employees upon termination of employment, among other things. In addition, companies operating in China are generally required to contribute to labor union funds and the mandatory social insurance and housing funds. Any failure by us to comply with Chinese labor and social insurance laws may subject us to late fees, fines and penalties, or cause the suspension or termination of our ability to conduct business in China, any of which could have a material and adverse effect on business, results of operations and prospects.

Developments relating to the United Kingdom's referendum vote in favor of leaving the European Union could adversely affect us.

Effective January 31, 2020, the United Kingdom commenced an exit from the European Union, commonly referred to as "Brexit." During a transition period (set to expire on December 31, 2020), the British government will continue to negotiate the terms of the United Kingdom's future relationship with the European Union. The outcome of these negotiations is uncertain, and we do not know to what extent Brexit will ultimately impact the business and regulatory environment in the United Kingdom, the rest of Europe, or other countries. The effects of the United Kingdom's withdrawal from the European Union, and the perceptions as to its impact, are expected to be far-reaching and may adversely affect business activity and economic conditions in Europe and globally and could continue to contribute to instability in global financial markets, including foreign exchange markets. The United Kingdom's withdrawal from the European Union could also have the effect of disrupting the free movement of goods, services and people between the United Kingdom and Europe and could also lead to legal uncertainty and potentially divergent national laws and regulations as the United Kingdom determines which European laws to replace or replicate, including laws that could impact our ability, or our collaborator's ability in the case of roxadustat, to obtain approval of our products or sell our products in the United Kingdom. Changes impacting our ability to conduct business in the United Kingdom or other European countries, or changes to the regulatory regime applicable to our operations in those countries (such as with respect to the approval of our product candidates), may materially and adversely impact our business, prospects, operating results, and financial condition.

Risks Related to the Operation of Our Business

We may encounter difficulties in managing our growth and expanding our operations successfully.

As we seek to advance our product candidates through clinical trials and commercialization, we will need to expand our development, regulatory, manufacturing, commercialization and administration capabilities or contract with third parties to provide these capabilities for us. As our operations expand and we continue to undertake the efforts and expense to operate as a public reporting company, we expect that we will need to increase the responsibilities on members of management in order to manage any future growth effectively. Our failure to accomplish any of these steps could prevent us from successfully implementing our strategy and maintaining the confidence of investors in us.

Loss of senior management and key personnel could adversely affect our ability to successfully develop our product candidates, conduct our clinical trials and commercialize our product candidates.*

We are highly dependent on members of our senior management team, including Enrique Conterno, our Chief Executive Officer. The loss of the services of Mr. Conterno or any of our senior management could significantly impact the development and commercialization of our products and product candidates and our ability to successfully implement our business strategy.

Recruiting and retaining qualified commercial, development, scientific, clinical, and manufacturing personnel are and will continue to be critical to our success, particularly as we expand our commercialization operations. Furthermore, replacing executive officers and key employees may be difficult and may take an extended period of time because of the limited number of individuals in our industry with the breadth of skills and experience required to successfully develop, gain regulatory approval of and commercialize product candidates. We may be unable to hire, train, retain or motivate these key personnel on acceptable terms given the intense competition among numerous biopharmaceutical companies for similar personnel.

There is also significant competition, in particular in the San Francisco Bay Area, for the hiring of experienced and qualified personnel, which increases the importance of retention of our existing personnel. If we are unable to continue to attract and retain personnel with the quality and experience applicable to our product candidates, our ability to pursue our strategy will be limited and our business and operations would be adversely affected.

If product liability lawsuits are brought against us, we may incur substantial liabilities and may be required to limit commercialization of our product candidates.

We face an inherent risk of product liability as a result of the clinical testing, manufacturing and commercialization of our product candidates. Any such product liability claims may include allegations of defects in manufacturing, defects in design, a failure to warn of dangers inherent in a product, negligence, strict liability or breach of warranty. Claims could also be asserted under state consumer protection acts. If we are unable to obtain insurance coverage at levels that are appropriate to maintain our business and operations, or if we are unable to successfully defend ourselves against product liability claims, we may incur substantial liabilities or otherwise cease operations. Product liability claims may result in:

- · termination of further development of unapproved product candidates or significantly reduced demand for any approved products;
- material costs and expenses to defend the related litigation;
- a diversion of time and resources across the entire organization, including our executive management;
- product recalls, withdrawals or labeling restrictions;
- termination of our collaboration relationships or disputes with our collaboration partners; and
- reputational damage negatively impacting our other product candidates in development.

If we fail to obtain and retain sufficient product liability insurance at an acceptable cost to protect against potential product liability claims, we may not be able to continue to develop our product candidates. We maintain product liability insurance in a customary amount for the stage of development of our product candidates. Although we believe that we have sufficient coverage based on the advice of our third-party advisors, there can be no assurance that such levels will be sufficient for our needs. Moreover, our insurance policies have various exclusions, and we may be in a dispute with our carrier as to the extent and nature of our coverage, including whether we are covered under the applicable product liability policy. If we are not able to ensure coverage or are required to pay substantial amounts to settle or otherwise contest the claims for product liability, our business and operations would be negatively affected.

Our business and operations would suffer in the event of computer system failures.

Despite the implementation of security measures, our internal computer systems, and those of our CROs, collaboration partners, and other third parties on which we rely, are vulnerable to damage from computer viruses, unauthorized access, natural disasters, fire, terrorism, war and telecommunication and electrical failures. We upgraded our disaster and data recovery capabilities in 2017, however, to the extent that any disruption or security breach, in particular with our partners' operations, results in a loss of, or damage to, our data or applications, or inappropriate disclosure of confidential or proprietary information, we could incur liability and it could result in a material disruption and delay of our drug development programs. For example, the loss of clinical trial data from completed, ongoing or planned clinical trials could result in delays in our regulatory approval efforts and significantly increase our costs to recover or reproduce the data.

We depend on sophisticated information technology systems to operate our business and a cyber-attack or other breach of these systems could have a material adverse effect on our business.

We rely on information technology systems to process, transmit and store electronic information in our day-to-day operations. The size and complexity of our information technology systems makes them vulnerable to a cyber-attack, malicious intrusion, breakdown, destruction, loss of data privacy or other significant disruption. While we have recently upgraded our disaster data recovery program, a successful attack could result in the theft or destruction of intellectual property, data, or other misappropriation of assets, or otherwise compromise our confidential or proprietary information and disrupt our operations. Cyber-attacks are becoming more sophisticated and frequent. We have invested in our systems and the protection and recoverability of our data to reduce the risk of an intrusion or interruption, and we monitor and test our systems on an ongoing basis for any current or potential threats. There can be no assurance that these measures and efforts will prevent future interruptions or breakdowns. If we fail to maintain or protect our information technology systems and data integrity effectively or fail to anticipate, plan for or manage significant disruptions to these systems, we could have difficulty preventing, detecting and controlling such cyber-attacks and any such attacks could result in losses described above as well as disputes with physicians, patients and our partners, regulatory sanctions or penalties, increases in operating costs and expenses, expenses or lost revenues or other adverse consequences, any of which could have a material adverse effect on our business, results of operations, financial condition, prospects and cash flows.

Our headquarters are located near known earthquake fault zones. The occurrence of an earthquake, fire or any other catastrophic event could disrupt our operations or the operations of third parties who provide vital support functions to us, which could have a material adverse effect on our business, results of operations and financial condition.*

We and some of the third-party service providers on which we depend for various support functions are vulnerable to damage from catastrophic events, such as power loss, natural disasters, terrorism and similar unforeseen events beyond our control. Our corporate headquarters and other facilities are located in the San Francisco Bay Area, which in the past has experienced severe earthquakes and fires, and has been affected by the COVID-19 pandemic, including economic disruption resulting from the related shelter-in-place and stay-at-home governmental orders.

After a comprehensive earthquake risk analysis conducted by Marsh Risk, we decided not to purchase earthquake or flood insurance. Based upon (among other factors) the Marsh Risk analysis, the design and construction of our building, the expected potential loss, and the costs and deductible associated with earthquake and flood insurance, we chose to self-insure. However, earthquakes or other natural disasters could severely disrupt our operations, or have a larger cost than expected, and have a material adverse effect on our business, results of operations, financial condition and prospects.

If a natural disaster, power outage or other event occurred that prevented us from using all or a significant portion of our headquarters, damaged critical infrastructure, or otherwise disrupted operations, it may be difficult or, in certain cases, impossible for us to continue our business for a substantial period of time. The disaster recovery and business continuity plans we have in place are unlikely to provide adequate protection in the event of a serious disaster or similar event. We may incur substantial expenses as a result of the limited nature of our disaster recovery and business continuity plans, which, particularly when taken together with our lack of earthquake insurance, could have a material adverse effect on our business.

Furthermore, integral parties in our supply chain are operating from single sites, increasing their vulnerability to natural disasters or other sudden, unforeseen and severe adverse events, such as the COVID-19 pandemic. If such an event were to affect our supply chain, it could have a material adverse effect on our business.

Risks Related to Our Common Stock

The market price of our common stock may be highly volatile, and you may not be able to resell your shares at or above your purchase price.

In general, pharmaceutical, biotechnology and other life sciences company stocks have been highly volatile in the current market. The volatility of pharmaceutical, biotechnology and other life sciences company stocks is sometimes unrelated to the operating performance of particular companies and biotechnology and life science companies stocks often respond to trends and perceptions rather than financial performance. In particular, the market price of shares of our common stock could be subject to wide fluctuations in response to the following factors:

- results of clinical trials of our product candidates, including roxadustat and pamrevlumab;
- the timing of the release of results of and regulatory updates regarding our clinical trials;
- the level of expenses related to any of our product candidates or clinical development programs;
- results of clinical trials of our competitors' products;
- safety issues with respect to our product candidates or our competitors' products;
- regulatory actions with respect to our product candidates and any approved products or our competitors' products;
- fluctuations in our financial condition and operating results, which will be significantly affected by the manner in which we recognize revenue from the achievement of milestones under our collaboration agreements;
- adverse developments concerning our collaborations and our manufacturers;
- the termination of a collaboration or the inability to establish additional collaborations;
- the inability to obtain adequate product supply for any approved drug product or inability to do so at acceptable prices;
- disputes or other developments relating to proprietary rights, including patents, litigation matters and our ability to obtain patent protection for our technologies;
- · changes in legislation or other regulatory developments affecting our product candidates or our industry;

Table of Contents Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 468 of 1730

- fluctuations in the valuation of the biotechnology industry and particular companies perceived by investors to be comparable to us;
- speculation in the press or investment community;
- announcements of investigations or regulatory scrutiny of our operations or lawsuits filed against us;
- activities of the government of China, including those related to the pharmaceutical industry as well as industrial policy generally;
- performance of other U.S. publicly traded companies with significant operations in China;
- changes in market conditions for biopharmaceutical stocks; and
- the other factors described in this "Risk Factors" section.

As a result of fluctuations caused by these and other factors, comparisons of our operating results across different periods may not be accurate indicators of our future performance. Any fluctuations that we report in the future may differ from the expectations of market analysts and investors, which could cause the price of our common stock to fluctuate significantly. Moreover, securities class action litigation has often been initiated against companies following periods of volatility in their stock price. This type of litigation could result in substantial costs and divert our management's attention and resources and could also require us to make substantial payments to satisfy judgments or to settle litigation.

If securities or industry analysts do not continue to publish research or reports about our business, or if they change their recommendations regarding our stock adversely, our stock price and trading volume could decline.

The trading market for our common stock will be influenced by the research and reports that industry or securities analysts publish about us or our business. If one or more of the analysts who cover us downgrade our stock, our stock price would likely decline. If one or more of these analysts cease coverage of us or fail to regularly publish reports on us, we could lose visibility in the financial markets, which in turn could cause our stock price or trading volume to decline.

Our principal stockholders and management own a significant percentage of our stock and will be able to exercise significant influence over matters subject to stockholder approval.*

As of July 31, 2020, our executive officers, directors and principal stockholders, together with their respective affiliates, owned approximately 40.03% of our common stock, including shares subject to outstanding options that are exercisable within 60 days after such date and shares issuable upon settlement of restricted stock units that will vest within 60 days after such date. This percentage is based upon information supplied by officers, directors and principal stockholders and Schedules 13D and 13G, if any, filed with the SEC, which information may not be accurate as of January 31, 2020. Accordingly, these stockholders will be able to exert a significant degree of influence over our management and affairs and over matters requiring stockholder approval, including the election of our board of directors and approval of significant corporate transactions. The interests of this group may differ from those of other stockholders and they may vote their shares in a way that is contrary to the way other stockholders vote their shares. This concentration of ownership could have the effect of entrenching our management and/or the board of directors, delaying or preventing a change in our control or otherwise discouraging a potential acquirer from attempting to obtain control of us, which in turn could have a material and adverse effect on the fair market value of our common stock.

We may engage in future acquisitions that could disrupt our business, cause dilution to our stockholders and harm our business, results of operations, financial condition and cash flows and future prospects.

We may, in the future, make acquisitions of, or investments in, companies that we believe have products or capabilities that are a strategic or commercial fit with our present or future product candidates and business or otherwise offer opportunities for us. In connection with these acquisitions or investments, we may:

- issue stock that would dilute our existing stockholders' percentage of ownership;
- incur debt and assume liabilities; and
- incur amortization expenses related to intangible assets or incur large and immediate write-offs.

Table of Contents Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 469 of 1730

We may not be able to complete acquisitions on favorable terms, if at all. If we do complete an acquisition, we cannot assure you that it will ultimately strengthen our competitive position or that it will be viewed positively by customers, financial markets or investors. Furthermore, future acquisitions could pose numerous additional risks to our operations, including:

- problems integrating the purchased business, products or technologies, or employees or other assets of the acquisition target;
- increases to our expenses;
- disclosed or undisclosed liabilities of the acquired asset or company;
- diversion of management's attention from their day-to-day responsibilities;
- reprioritization of our development programs and even cessation of development and commercialization of our current product candidates;
- harm to our operating results or financial condition;
- entrance into markets in which we have limited or no prior experience; and
- potential loss of key employees, particularly those of the acquired entity.

We may not be able to complete any acquisitions or effectively integrate the operations, products or personnel gained through any such acquisition.

Provisions in our charter documents and Delaware law may have anti-takeover effects that could discourage an acquisition of us by others, even if an acquisition would be beneficial to our stockholders, and may prevent attempts by our stockholders to replace or remove our current directors or management.

Provisions in our amended and restated certificate of incorporation and amended and restated bylaws contain provisions that may have the effect of discouraging, delaying or preventing a change in control of us or changes in our management. These provisions could also limit the price that investors might be willing to pay in the future for shares of our common stock, thereby depressing the market price of our common stock. In addition, because our board of directors is responsible for appointing the members of our management team, these provisions may frustrate or prevent any attempts by our stockholders to replace or remove our current management by making it more difficult for stockholders to replace members of our board of directors. Among other things, these provisions:

- authorize "blank check" preferred stock, which could be issued by our board of directors without stockholder approval and may contain voting, liquidation, dividend and other rights superior to our common stock;
- create a classified board of directors whose members serve staggered three-year terms;
- specify that special meetings of our stockholders can be called only by our board of directors pursuant to a resolution adopted by a majority
 of the total number of directors;
- prohibit stockholder action by written consent;
- establish an advance notice procedure for stockholder approvals to be brought before an annual meeting of our stockholders, including proposed nominations of persons for election to our board of directors;
- provide that our directors may be removed prior to the end of their term only for cause;
- provide that vacancies on our board of directors may be filled only by a majority of directors then in office, even though less than a quorum;
- require a supermajority vote of the holders of our common stock or the majority vote of our board of directors to amend our bylaws; and
- require a supermajority vote of the holders of our common stock to amend the classification of our board of directors into three classes and to amend certain other provisions of our certificate of incorporation.

These provisions, alone or together, could delay or prevent hostile takeovers and changes in control or changes in our management by making it more difficult for stockholders to replace members of our board of directors, which is responsible for appointing the members of our management.

Table of Contents Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 470 of 1730

Moreover, because we are incorporated in Delaware, we are governed by certain anti-takeover provisions under Delaware law which may discourage, delay or prevent someone from acquiring us or merging with us whether or not it is desired by or beneficial to our stockholders. We are subject to the provisions of Section 203 of the Delaware General Corporation Law, which prohibits a person who owns in excess of 15% of our outstanding voting stock from merging or combining with us for a period of three years after the date of the transaction in which the person acquired in excess of 15% of our outstanding voting stock, unless the merger or combination is approved in a prescribed manner.

Any provision of our amended and restated certificate of incorporation, our amended and restated bylaws or Delaware law that has the effect of delaying or deterring a change in control could limit the opportunity for our stockholders to receive a premium for their shares of our common stock, and could also affect the price that some investors are willing to pay for our common stock.

Changes in our tax provision or exposure to additional tax liabilities could adversely affect our earnings and financial condition.*

As a multinational corporation, we are subject to income taxes in the U.S. and various foreign jurisdictions. Significant judgment is required in determining our global provision for income taxes and other tax liabilities. In the ordinary course of a global business, there are intercompany transactions and calculations where the ultimate tax determination is uncertain. Our income tax returns are subject to audits by tax authorities. Although we regularly assess the likelihood of adverse outcomes resulting from these examinations to determine our tax estimates, a final determination of tax audits or tax disputes could have an adverse effect on our results of operations and financial condition.

We are also subject to non-income taxes, such as payroll, excise, customs and duties, sales, use, value-added, net worth, property, gross receipts, and goods and services taxes in the U.S., state and local, and various foreign jurisdictions. We are subject to audit and assessments by tax authorities with respect to these non-income taxes and may have exposure to additional non-income tax liabilities, which could have an adverse effect on our results of operations and financial condition.

In addition, our judgment in providing for the possible impact of the Tax Act remains subject to developing interpretations of the provisions of the Tax Act. As regulations and guidance evolve with respect to the Tax Act, we continue to examine the impact to our tax provision or exposure to additional tax liabilities, which could have a material adverse effect on our business, results of operations or financial condition.

Tariffs imposed by the U.S. and those imposed in response by other countries, as well as rapidly changing trade relations, could have a material adverse effect on our business and results of operations.

Changes in U.S. and foreign governments' trade policies have resulted in, and may continue to result in, tariffs on imports into and exports from the U.S. Throughout 2018 and 2019, the U.S. imposed tariffs on imports from several countries, including China. In response, China has proposed and implemented their own tariffs on certain products, which may impact our supply chain and our costs of doing business. If we are impacted by the changing trade relations between the U.S. and China, our business and results of operations may be negatively impacted. Continued diminished trade relations between the U.S. and other countries, including potential reductions in trade with China and others, as well as the continued escalation of tariffs, could have a material adverse effect on our financial performance and results of operations.

Our amended and restated certificate of incorporation designates the state or federal courts located in the State of Delaware as the sole and exclusive forum for certain types of actions and proceedings that may be initiated by our stockholders, which could limit our stockholders' ability to obtain a favorable judicial forum for disputes with us or our directors, officers or employees.*

Our amended and restated certificate of incorporation provides that, subject to limited exceptions, the state and federal courts located in the State of Delaware will be the sole and exclusive forum for the following types of actions or proceedings under Delaware statutory or common law: (1) any derivative action or proceeding brought on our behalf, (2) any action asserting a claim of breach of a fiduciary duty owed by any of our directors, officers or other employees to us or our stockholders, (3) any action asserting a claim against us arising pursuant to any provision of the Delaware General Corporation Law, our amended and restated certificate of incorporation or our amended and restated by-laws, or (4) any other action asserting a claim against us that is governed by the internal affairs doctrine. This provision would not apply to suits brought to enforce a duty or liability created by the Exchange Act. Furthermore, Section 22 of the Securities Act creates concurrent jurisdiction for federal and state courts over all such Securities Act actions. Accordingly, both state and federal courts have jurisdiction to entertain such claims. To prevent having to litigate claims in multiple jurisdictions and the threat of inconsistent or contrary rulings by different courts, among other considerations, our amended and restated certificate of incorporation further provides that the federal district courts of the United States of America will be the exclusive forum for resolving any complaint asserting a cause of action arising under the Securities Act. While the Delaware courts have determined that such choice of forum provisions are facially valid, a stockholder may nevertheless seek to bring a claim in a venue other than those designated in the exclusive forum provisions. In such instance, we would expect to vigorously assert the validity and enforceability of the exclusive forum provisions of our amended and restated certificate of incorporation. This may require significant additional costs associated with resolvin

This choice of forum provision may limit a stockholder's ability to bring a claim in a judicial forum that it finds favorable for disputes with us or our directors, officers or other employees, which may discourage such lawsuits against us and our directors, officers and employees. If a court were to find these provisions of our amended and restated certificate of incorporation inapplicable to, or unenforceable in respect of, one or more of the specified types of actions or proceedings, we may incur additional costs associated with resolving such matters in other jurisdictions, which could adversely affect our business and financial condition.

Because we do not anticipate paying any cash dividends on our capital stock in the foreseeable future, capital appreciation, if any, will be your sole source of gain and you may never receive a return on your investment.

You should not rely on an investment in our common stock to provide dividend income. We do not anticipate that we will pay any cash dividends to holders of our common stock in the foreseeable future and investors seeking cash dividends should not purchase our common stock. We plan to retain any earnings to invest in our product candidates and maintain and expand our operations. Therefore, capital appreciation, or an increase in your stock price, which may never occur, may be the only way to realize any return on your investment.

ITEM 2. UNREGISTERED SALES OF EQUITY SECURITIES AND USE OF PROCEEDS.

Use of Proceeds from Initial Public Offering of Common Stock

On November 13, 2014, our Registration Statement on Form S-1, as amended (Reg. Nos. 333-199069 and 333-200189) was declared effective in connection with the initial public offering of our common stock. There has been no material change in the planned use of proceeds from our initial public offering as described in our final prospectus filed with the SEC pursuant to Rule 424(b) under the Securities Act on November 14, 2014.

ITEM 3. DEFAULTS UPON SENIOR SECURITIES.

Not applicable.

CERTIFICATION

- I, Enrique Conterno, certify that;
- 1. I have reviewed this Form 10-Q of FibroGen, Inc.;
- 2. Based on my knowledge, this report does not contain any untrue statement of a material fact or omit to state a material fact necessary to make the statements made, in light of the circumstances under which such statements were made, not misleading with respect to the period covered by this report;
- 3. Based on my knowledge, the financial statements, and other financial information included in this report, fairly present in all material respects the financial condition, results of operations and cash flows of the registrant as of, and for, the periods presented in this report;
- 4. The registrant's other certifying officer and I are responsible for establishing and maintaining disclosure controls and procedures (as defined in Exchange Act Rules 13a-15(e)) and 15d-15(e)) and internal control over financial reporting (as defined in Exchange Act Rules 13a-15(f)) and 15d-15(f)) for the registrant and have:
- (a) Designed such disclosure controls and procedures, or caused such disclosure controls and procedures to be designed under our supervision, to ensure that material information relating to the registrant, including its consolidated subsidiaries, is made known to us by others within those entities, particularly during the period in which this report is being prepared;
- (b) Designed such internal control over financial reporting, or caused such internal control over financial reporting to be designed under our supervision, to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles;
- (c) Evaluated the effectiveness of the registrant's disclosure controls and procedures and presented in this report our conclusions about the effectiveness of the disclosure controls and procedures, as of the end of the period covered by this report based on such evaluation; and
- (d) Disclosed in this report any change in the registrant's internal control over financial reporting that occurred during the registrant's most recent fiscal quarter (the registrant's fourth fiscal quarter in the case of an annual report) that has materially affected, or is reasonably likely to materially affect, the registrant's internal control over financial reporting; and
- 5. The registrant's other certifying officer(s) and I have disclosed, based on our most recent evaluation of internal control over financial reporting, to the registrant's auditors and the audit committee of the registrant's board of directors (or persons performing the equivalent functions):
- (a) All significant deficiencies and material weaknesses in the design or operation of internal control over financial reporting which are reasonably likely to adversely affect the registrant's ability to record, process, summarize and report financial information; and
- (b) Any fraud, whether or not material, that involves management or other employees who have a significant role in the registrant's internal control over financial reporting.

ANALYSTS

Joel Lawrence Beatty *Citigroup Inc., Research Division*

Presentation

Joel Lawrence Beatty

Citigroup Inc., Research Division

Hi, everyone. Thanks for joining the session with FibroGen. I'm pleased to have with us the CEO, Enrique Conterno. Enrique, thanks for joining us today.

Enrique A. Conterno

CEO & Director

No, thank you very much, Joe. I very much appreciate the invitation. Look forward to discussing a number of topics.

Joel Lawrence Beatty

Citigroup Inc., Research Division

Yes. Great. So I guess, I think a lot of viewers are going to be familiar with FibroGen, but some may not. So could you begin with an overview of what the key areas of focus are for FibroGen?

Enrique A. Conterno

CEO & Director

Sure. So FibroGen is a company very much based in science. We've been able to progress 2 key products, one of them, roxadustat. The second one, pamrevlumab, which are very much in late stages. Roxa has already been commercialized in China and Japan and undergoing review in the U.S., Europe. And pamrevlumab has now 3 studies in clinical -- 3 programs in Phase III in clinical development in IPF, which is idiopathic, pulmonary fibrosis, Duchenne muscular dystrophy and finally, in locally unresectable pancreatic cancer -- locally advanced unresectable pancreatic cancer. In addition to that, I think we are making a concerted effort to really advance new products into the clinic. We are delighted to have announced that Percy Carter is joining FibroGen to lead our scientific efforts. We're very excited about that.

So it's -- the focus for FibroGen is really around fibrotic diseases, cancer and, of course, anemia, given roxadustat program.

Question and Answer

Joel Lawrence Beatty

Citigroup Inc., Research Division

Great. So a lot of great topics in there to discuss over the next 45 minutes or so. But let's begin with the topic that I think is probably at the top of a lot of investors' minds, and that's the vadadustat results that came out last week from Akebia in non-dialysis setting that seemed disappointing. But could you discuss your take on those results? And what that means for roxadustat?

Enrique A. Conterno

CEO & Director

Yes, I think, there are 3 elements that I would highlight as we think about those results and in the context for roxa. I think number one, I think, is the significant level of evidence that we have already with roxadustat around NDD. As you know, when we look at our pool studies for NDD, we were able to show non-inferiority relative to placebo, which is a higher bar than a comparison to a product that had -- or product to have box warnings. So we feel very good about our pool MACE data in NDD.

Second, in addition to the pool studies, we have an additional study, DOLOMITES, which is a study against an active comparator, darbepoetin, where we adjudicated MACE events. And in that study, when we look at time to MACE events, we basically had a hazard ratio of 0.81 in favor of roxadustat. So favorable trend in favor for roxadustat, an additional study.

And then finally, I would highlight that -- which I think is important to put in context. But when it comes to cardiovascular studies, we've seen there's ample precedent for the FDA to basically label the products with their corresponding outcomes from CV, meaning different outcomes even within the same class, then we'll have different labels. We, of course, have -- see this in GLP-1s, where we've seen a number of different studies. Some GLP-1 have protective claims when it comes to CV, some do not. Some have different populations. So we see though the specific results for each product basically reflected on each of their respective labels. That's not only the case for GLP-1, so we can think about SGLT2s or DPP-4s, where we basically see the MACE data reflected of those -- of the specific results for the molecules.

We think that's also how investors should be thinking about roxadustat and the results that we have, meaning not all HIFs necessarily are the same, so we have our own evidence and we feel very good about the level of evidence that we have with roxadustat.

Joel Lawrence Beatty

Citigroup Inc., Research Division

Very good. And maybe one -- I'll ask it about a little bit more is the DOLOMITES data. And I know that there's a lot of studies that FibroGen has on roxadustat that go under this package. If I have them straight, I think DOLOMITES isn't necessarily part of the main core U.S. studies and was conducted to just help support -- I think it may have been requested by Europe. But could you share a little bit more about how much is able -- is that still submitted to FDA? How much are they able to look at that and consider that now?

Enrique A. Conterno

CEO & Director

Yes. So the FDA -- for purposes of MACE, I think the FDA basically requested a particular way of us pulling certain studies because in NDD, all of our studies were against placebo. DOLOMITES is against an active comparator. It's difficult to combine apples and oranges because you're having different levels of comparison. So our submission basically reflected the 3 studies that we have relative to placebo and basically the MACE -- the adjudicated MACE outcomes and looking at safety from that perspective.

DOLOMITES is an additional study. And yes, we submit all of the information that we have to the FDA, including a study that may not be part of the pool studies, but basically, the FDA gets to see all of our data.

Joel Lawrence Beatty

Citigroup Inc., Research Division

Okay. Great. And then in the -- some of this relates to labeling. And I think a discussion that's come up a lot with investors, even before the data we saw last week is could roxadustat have a black box warning. And I know that at this point, we're getting close to the PDUFA date in December. So there's probably not a lot you can say on that. But maybe just generally, how important is this debate even to have? Is it important to roxadustat whether it has a black box warning or not?

Enrique A. Conterno

CEO & Director

Yes. So we commented as part of the Q3 -- Q2 earnings call that unfortunately, given it was imminent that we would be entering labeling discussions that we were not going to be able to make further comments in terms of our engagement with the FDA. So that is the case. We feel -- I think what I can say is we feel very good about where we are in terms of the review with the FDA, the level of engagement that we have. I know this question about a box warning comes often, which is are we going to get one or not. My -- and what is the impact that a box warning would have? It's always difficult to handicap what is going to be the final level. But we feel very good about the level of energy that we have. I think what I've said before is that we have excellent data. We don't believe that the data that we have warrants a box warning. But once again, difficult to handicap what we'll end up with the FDA.

What I would say is that it is not only whether you have a box warning or not, but also what does the box warning say. There are ample examples out there where products that have box warnings basically have done incredibly well in terms of having commercial success. There is one condition, which I think is met in the case of roxadustat, but it's difficult for a product that has a box warning if the competitors in the class don't have one. I think the uptake and the overall commercial ability to be highly successful commercially is -- can be impaired. But in this particular case, we are entering a field where products do have a box warning in the case of ESAs. So it is not a limiting factor. I don't think it limits the overall long-term success of the product. Box warning may limit some of the initial uptick, but long term, I think we have ample of evidence that we see these products are very much as a transformational medicine.

Joel Lawrence Beatty

Citigroup Inc., Research Division

That's great. So let's pivot away from labeling. And maybe could I ask about reimbursement and focusing on the dialysis setting and that's unique that there's the bundled payment system that many patients are under in the U.S. and then there's also the TDAPA program that could cover the first couple of years or so, I believe. Could you tell us about the process generally for roxadustat, and see if it's eligible for TDAPA and when you find out about that?

Enrique A. Conterno

CEO & Director

Yes. So we believe that roxa will be eligible for -- TDAPA is eligible for TDAPA once it is approved. I think the process is once we receive approval, we will submit a request something called -- that is called a HCPCS code and then submit for TDAPA reimbursement. We think it is critical for us to be prepared to do this as soon as we get approval so that we can get the reimbursement for TDAPA as soon as possible. We believe that reimbursement could come as early as April 1 because we see now CMS that could be -- is, from a guidance perspective, making decisions on a quarterly basis. So I think the idea -- best-case scenario for us to be -- and I think also something that is likely is that for us to shoot to have reimbursement from a TDAPA perspective starting April 1 of next year. Clearly, this is critically important because it is an incentive for -- that CMS is providing for dialysis organizations to be able to include products that deliver innovation into their protocols. And in a certain way, it's almost -- it eliminates any type of economic disincentive not to include products.

So -- and as you mentioned, it -- TDAPA, according to the guidance today, would last for a period of 2 years. So I think it is critically important for us, and we're working to ensure that we get reimbursement through TDAPA as soon as possible.

Joel Lawrence Beatty

Citigroup Inc., Research Division

That sounds great. And April 1 day just comes a few months after the December PDUFA date. So that seems like nice timing. And then can I ask what happens after that 2-year period of TDAPA? Do we know if roxadustat would be in the bundle or not? Or what -- how do you figure out what happens after those 2 years?

Enrique A. Conterno

CEO & Director

I think the concept under TDAPA and the concept behind the 2 years is that CMS will basically review the experience with roxadustat based on those 2 years and the benefits that roxadustat offers. And then I think the intent will be to try to think about how to include basically roxadustat or HIF-PHIs into the bundle and what the appropriate rate for the bundle will be based on that experience and the benefit that they've seen with the innovation.

Joel Lawrence Beatty

Citigroup Inc., Research Division

Great. So let's switch to non-dialysis. Could you just -- could you help frame the size of the addressable market? And I ask because for dialysis patients, it seems like there's a lot of great data out there that makes them pretty easy to count. But I don't think the same is true for non-dialysis. So how do you think about the size of that market?

Enrique A. Conterno

CEO & Director

Yes. The way I think about the size is for us to be able to look at patients with CKD and anemia, and we are looking at stages mainly 3 to 5. And we are -- we need to be thinking about, okay, what is the size of that overall population. I think roughly, you can estimate that in the U.S., there are about maybe 5 million patients with CKD and anemia in total. Now this is anemia defined at higher levels that in terms of hemoglobin that we will be able to treat with roxa. So we need to -- when we think about the addressable market for roxa, it's maybe half of that size. So I think about an overall universe of our addressable market of about 2.5 million patients that could be potentially treated with roxadustat in that setting.

Joel Lawrence Beatty

Citigroup Inc., Research Division

Got it. So the 2.5 million seems to be I think higher than where ESAs are at right now in non-dialysis patients. But certainly, they have a long history of their own issues. Can you maybe help frame the perspective of what could help grow the non-dialysis market opportunity beyond where ESAs are at right now?

Enrique A. Conterno

CEO & Director

Yes. So today, I think most patients with CKD and anemia in non-dialysis setting actually are not treated with an ESA. In fact, when you look at data, looking at the 12 months prior to going on dialysis, you look at maybe about -- only about 14% of those patients have been treated with ESA. So what that basically means that there's a huge opportunity to basically be able to activate and be able to treat many more patients that are suffering from anemia. The opportunity here is one of market expansion. And we are thinking not about an increase of 10% or 20%, but we're thinking about a multiple increase relative to the opportunity.

Keep in mind that prior to ESAs getting some of those negative trials in NDD when it comes to certain levels of hemoglobin targets and so forth, the rate of treatment was nearly 30%. Today, the rate of treatment is less than half of that, with CKD and anemia, specifically on the NDD setting. So there's a very good past history that there's a need to be able to treat patients. And we think that roxadustat, therefore, can be an important catalyst for the market expansion. So we think this is a very relevant and important opportunity for us.

Joel Lawrence Beatty

Citigroup Inc., Research Division

Terrific. So FibroGen seems to have a presence all over the world in one way or another, and one very common area is China. Roxadustat is already on the market there. And earlier this year, we saw sales increase from \$5 million in Q1 to about \$16 million in Q2, which was a nice increase. Could you describe a little bit what was behind that increase? And how to think about that trajectory going forward?

Enrique A. Conterno

CEO & Director

Yes. We're very pleased with the increase that we saw in terms of revenues with roxa in China. Clearly, as you know, we received NRDL inclusion, effective at the start of this year. So the first couple of quarters have been terrific, \$5 million and \$15.7 million, respectively. I think what we see in an underlying metric that is very important for trying to think about long-term success for the product is basically how well the hospital listings are progressing. And we mentioned that at the end of Q2, our hospital listings in China because once -- yes, you can have national reimbursement, but then you need to list hospital to hospital.

But our hospital listings are -- today -- as at the end of Q2, represented already 45% of the overall CKD anemia opportunity in China. Quite frankly, that is a very significant number. The progress is excellent. You can look at a number of benchmarks or products that have become blockbusters and what were they able to achieve the first couple of quarters relative to -- in terms of coverage. So we feel that we made already significant progress.

Listing is a particularly important metric to look at because it is not like hospitals can just list products. Anytime a hospital lists a product, they actually have to -- in China, you have to exclude a product. So you are, in a sense, making a trade-off. So we feel very good about the products that we make. In addition to that is when we look at the adoption that we have, I think we feel very good about not just the overall adoption the hospitals are -- that different prescribers are having, but also about the breadth of different patients. It's not just dialysis patients, but we basically look at the breadth of patients that physicians are choosing for roxadustat, everything from home dialysis to NDD. And if there is a probably an area where we've been surprised is how quickly we've seen adoption in the NDD segment in China. So we're very pleased with that. And I think it provides -- I think the breadth of patients provides, what I say, a number of different ways, levers for us to grow long term. It's a great predictor of long-term success.

Joel Lawrence Beatty

Citigroup Inc., Research Division

That's great. So a lot of great points in there in terms of hospital listings and the breadth of patients that are on roxadustat. The non-dialysis point was interesting that you've seen growth there. And maybe a little bit early there in the launch to ask this question, but what do you see as the adherence like in non-dialysis patients? Do they just take it, address their anemia and stop? Or is it the type of thing that they're continuing?

Enrique A. Conterno

CEO & Director

It's always difficult -- first, it's always difficult to measure and look at length of therapy in a specific setting because you need longitudinal data. We have expected that adherence in the dialysis setting is going to be very good and more challenging in non-dialysis setting, just because you're part of the protocol on the dialysis setting and it's -- it can be administered even during the dialysis session. So when it comes to NDD, that is going to be a key focus for us to ensure how can we ensure not just that we have enough

patients being started on roxadustat, but how do we ensure that the length of therapy is appropriate and how when we do that, we can make that as long as possible. I think it's too early for us to comment on that, but that's something that we are looking at carefully and something that we'll be able to comment more in the future.

Joel Lawrence Beatty

Citigroup Inc., Research Division

That's great. So one more question on China. And during the Q2 earnings, you announced that there is the, I think, a revised agreement with AstraZeneca. Could you tell us more about the key points of what's new in that agreement?

Enrique A. Conterno

CEO & Director

Sure. So I think it was an opportunity for AstraZeneca and FibroGen to basically update the China agreement. I think for FibroGen, I think first, for both parties, I think it better aligns both parties to ensure that we are maximizing the opportunity that we have with roxa. In particular for FibroGen, I think our overall profitability becomes more predictable and improved with the new agreement. So we -- that's something that was important to us as well.

Joel Lawrence Beatty

Citigroup Inc., Research Division

Okay. Very good. So for roxa, just maybe moving away from anemia of chronic kidney disease, there's also other areas of focus. Could you provide an update on the status in those -- I think there's 2 other main areas, MDS and chemotherapy-induced anemia. Tell us about...

Enrique A. Conterno

CEO & Director

Yes. So we have disclosed those 2 studies, and we're also looking at additional potential opportunities within the anemia space with roxadustat. But specifically, when it comes to MDS and CIA, MDS is now in Phase III and trial is enrolling. So we expect to complete enrollment next year. We'll be providing very specific time lines on each one of our trials for roxa and pam at the Q3 earnings call.

CIA, for us, chemo-induced anemia, is a much larger opportunity. Almost when we look at relative size, almost comparable to what we think an anemia CKD is, so very significant opportunity. We're in Phase II, and we are enrolling very well, and hopefully, we'll be fully enrolled this year. So we want to be enrolled as soon as possible and then thinking about, of course, starting the Phase III based on those results.

Joel Lawrence Beatty

Citigroup Inc., Research Division

Great. And so next month is ASN. FibroGen certainly had a big presence there last year with their data. Are you able to share anything about what to expect from FibroGen next month at ASN?

Enrique A. Conterno

CEO & Director

Yes. We expect a record presence at ASN. I think a key part of our preparation for launch is ensuring that we have all of our data out there. So we are expecting about 40 different types of presentations at ASN that's record-breaking for us. And that includes about 10 oral presentations and then posters and so forth. So very, very significant presence.

In addition to ASN for us, it is critical that we basically publish our key studies, both individual studies that have been conducted, but also some of the pool analysis when it comes to safety, when it comes to MACE, both in DD and NDD, but also in incident dialysis, the pool incident dialysis MACE study. So all of that is very much in progress. We made most, if not all, of the submission when it comes to publications of all

of these key studies, and we expect all of them are going to be published by the end of the year, prior to launch.

Joel Lawrence Beatty

Citigroup Inc., Research Division

That's great. And 40 presentations is striking, and I think it makes me reminisce of the old days not too long ago, trying to run around and catch 40 different presentations in person at one meeting, but the times have changed and hopefully, we can catch them all virtually.

Enrique A. Conterno

CEO & Director

Yes. I think one thing that sometimes maybe is underappreciated with roxadustat is we've conducted so many studies, right? And many of them are long-term studies when it comes to -- because we were looking at cardiovascular outcomes. So there's a lot of possibility for us to mine that data. Some of those analysis, of course, are post hoc, but they're interesting for us to be able to look at a number of different elements of those studies. It's very exciting. There's a lot of learning. And I think I see a lot of different elements and a lot of different value that I think roxadustat can provide to patients.

Joel Lawrence Beatty

Citigroup Inc., Research Division

That's great. So maybe let's switch gears to pamrevlumab. And recently, you started a trial in COVID for that agent. Can you tell us a little bit about what we might have learned from a trial in that setting?

Enrique A. Conterno

CEO & Director

Yes. As -- we basically started 2 trials in COVID, one in Italy. The Italian trial is investigator-initiated trial. So we are, of course, providing the product and so forth, but it is different from the trial in the United States, where we are the formal sponsor of that Phase II trial. Keep in mind that when it comes to COVID, we are looking at 2 different types of trials within COVID. One of them is the acute phase and also, we're looking at the post-hospitalization phase for patients that develop fibrosis in the lungs and the ability for pamrevlumab to be able to help with that. Clearly, we have the IPF data that gives us a lot of confidence.

On the trial that we started is the acute trial. I'll be honest, I think it's very challenging to enroll in that trial right now, given the hundreds of trials that are involved when it comes to acute COVID and also some new therapies that people believe are already helping. So enrollment is extremely challenging in that specific trial.

When it comes to the chronic trial, we feel that so the -- post the acute phase for -- and we think about helping patients with their fibrosis. We feel that, that trial will be much easier to enroll, but I think it is critical for us that we have good alignment with the FDA on the type of design and the endpoints for this trial so that we can continue to develop and eventually, hopefully, even make it to market. We feel a good level of conviction in the trial given the IPF data that we've seen.

Joel Lawrence Beatty

Citigroup Inc., Research Division

Great. Maybe on that last point, what timing in the process do you look for the alignment with FDA?

Enrique A. Conterno

CEO & Director

I think at the time that we are designing the study, we want to make sure that the evidence that we have is going to be adequate for us to be able to move quickly. Clearly, this is a -- when we look at that -- those specific patients, there are no treatments, of course. So we are in a certain way, plowing new ground. So agreement with the FDA on the specific endpoints, I think, is going to be critical. It's not just us looking at that, you can imagine products in the IPF space are also thinking about that. And my sense is just given

that level of discussion that we had with the FDA is that many of those sponsors are also having some very similar discussions with the FDA.

Joel Lawrence Beatty

Citigroup Inc., Research Division

That's great. As you think about pamrevlumab and lung disease. And I think one of the unique things about the IPF data set for pamrevlumab is the imaging data that showed improvements in HRCT. Is there a potential to see something like that in COVID patients or not given that disease, how does that work?

Enrique A. Conterno

CEO & Director

Yes. We think so that -- I think it's an advantage to pam because when it comes -- given that we have underlying improvements in fibrosis, so we want to really make sure that we can look at imaging data. Imaging data is important for to -- from a level of earnings perspective, but the FDA also looks for more functional endpoints, so clinical endpoints. Clearly, when it comes to IPF, it is forced vital capacity as the accepted primary endpoint. I think it's difficult for -- it has been difficult for the FDA to approve products for fibrosis merely on imaging. I think it's an additional aspect that basically support the biology of the product, the effect of the product and the underlying disease. And as you said, I think it's critically important because I think foundationally, we are basically impacting the progression of the disease.

So all of that is important, but the FDA will look for functional endpoint. It's important that we have alignment on those.

Joel Lawrence Beatty

Citigroup Inc., Research Division

Got it. So maybe switching to IPF. It seems like IPF and chronic lung diseases, in general, has been a really tough area for enrolling in clinical trials nowadays with COVID. How is enrollment going in your IPF program?

Enrique A. Conterno

CEO & Director

I think it's a challenge, as you well said, I think patients with IPF are particularly vulnerable to COVID. So we actually decided to pause our studies back in March. We restarted not long ago some of those studies. So what we did in the meantime that we basically paused enrollment of our studies, we first wanted to ensure the continued integrity of the trial, meaning for patients that were already on pamrevlumab had been enrolled ensuring the continuity of care and safety of those patients in a clinical trial. I think we managed that well. Importantly, also is how do we make sure that once we're able to restart enrollment, which is where we are now, how do we put ourselves in the best position to enroll quickly. And I think we've done a very nice job in terms of activating new sites for IPF when it comes to ZEPHYRUS 1.

So we've expanded the number of sites in the U.S., also outside of the U.S. And in particular, in areas where we see COVID under control, we are seeing good enrollment like South Korea and so forth. We have a second IPF trial, which is expected to start very soon, ZEPHYRUS 2, which looks at mainly enrollment in Europe. And we also have a very good plan for us to activate all of those sites as guickly as possible.

Clearly, this is an area of focus for us when it comes to enrollment. We'll be providing very specific time lines for each one of our trials with pamrevlumab and roxadustat at the Q3 earnings call in terms of what are the next milestones and when do we expect data readouts and so forth.

Joel Lawrence Beatty

Citigroup Inc., Research Division

Great. Let's see. So I think maybe on that point, with pancreatic cancer and DMD Phase III trials, I think are also underway. I think with DMD just moving ahead in the last few days or so. I think it's on a press release. It sounds like you'll have more to share later on, but maybe could you tell us a little bit about those?

Enrique A. Conterno

CEO & Director

I can. I think LAPC, I think, is enrolling well. So we feel good about how that trial is enrolling right now. Clearly, I think focus for us has been also site activation. And I think we've made a lot of progress as well on the site activation side. I think that we are in a very good position to enroll that quickly. And I view the trial as highly valuable, not only in the trial itself and the level of confidence given the results that we saw in Phase II, but also I think the optionality that, that trial provides, when it comes to additional indications related to pancreatic cancer, whether it's maintenance or whether it's metastatic. So I feel very good about the opportunities that, that trial specifically gives us.

When it comes to DMD, we just started, I think the focus right now is site activation and, of course, some enrollment. But we feel very good about the ability to enroll in that population quickly. Those patients with DMD also are particularly vulnerable to COVID-19. So we need to be -- we need to take all the appropriate precautions and makes it a little more challenging to enroll as well. But we have to realize also those patients don't have many options, and we think that pamrevlumab is a product that can truly make a difference for those patients.

Joel Lawrence Beatty

Citigroup Inc., Research Division

Great. So maybe circling back to IPF. I believe that the Phase III program is designed as a monotherapy program. Could you share a little bit about the implications of taking that approach, maybe in terms of enrollment in clinical trials as well as the commercial opportunity, if approved?

Enrique A. Conterno

CEO & Director

Yes. Keep in mind, when we looked at our Phase II data for IPF, I think the data is, in my opinion, spectacular and that when we look at the data, we show basically an effect size that is unmatched. It's better than any product that is standard of care today or any product in development. Our Phase III basically try to replicate that. Why are we starting it that way and the implications for enrollment? Clearly, from an enrollment perspective, it becomes more challenging to either involve naive patients or patients naive to treatment or patients that are -- that have failed on the standard of care. So yes, it is more difficult to enroll. But I think the opportunity, given what we think the effect size could be for pamrevlumab, I think, it's very significant. And that we feel that not only that we can have a very large effect size in Phase III, just like we showed in Phase II when it comes to forced vital capacity. But in addition to that, we believe that we can show an impact in the underlying disease and of course, imaging helps with that, but also some of the measures that we look at that, including mortality, of course.

So all in all, I think we feel that if the data from Phase II is replicated into Phase III that we will have a product that will be used as standard of care. And I think the question then is, what product should accompany that product, if at all, but we want to create in pamrevlumab the standard for IPF.

Joel Lawrence Beatty

Citigroup Inc., Research Division

Great. So maybe let's take a step back and look at maybe some questions about the larger company as a whole. And one is, as you mentioned in your opening remarks, FibroGen created a new role for a Chief Scientific Officer and made a hire there. Can you characterize maybe the timing and importance of that? And what's the -- I think there's just so much talk about FibroGen as this clinical stage company, but what's going on in the preclinical research and development nowadays?

Enrique A. Conterno

CEO & Director

Yes. I think it's fair to say, I think the company has been focused on our late-stage products for quite some time, given the progress that we made when it comes to clinical development. But I think we have to realize that FibroGen is in a unique position when it comes to the type of science that we are advancing.

I think it's fair to say that we are a leading company -- the leading company when you have to HIF biology and when it comes to CTGF biology. And both scientific platforms, well, they have yielded a products. In the case of roxadustat, already commercially available in China and Japan and under review. In the case of pamrevlumab in Phase III, the opportunities to leverage the understanding of the biology and our expertise is very significant. So I see multiple opportunities. Sometimes, when I say that people say, well, are you develop -- planning to develop other HIF-PHIs, maybe, but I'm thinking beyond HIF-PHIs. And we -- our aim in terms of -- and our goal with recruiting Percy Carter is to -- as our new Chief Scientific Officer is really to give all of our efforts when it comes to research the type of leadership that our science warrants, which is we are really -- we really want to invest behind our research and bring new products into the clinic. And we think given the platform, the scientific platform that we have, we have a great opportunity to do so.

I think this is very much an underappreciated part of the FibroGen story and one that I think can create huge future value for the company and for patients.

Joel Lawrence Beatty

Citigroup Inc., Research Division

Very good. And so another question I'd like to ask you is what -- and FibroGen has quite a bit of cash when you look at -- I think it was \$716 million in cash at the end of last quarter, but then there's also milestones that seem pretty likely to come, I think, it's \$245 million of milestones over the next 12 months. So that gets to, I think, just under \$1 billion when we put that all together. Any plans for that cash going forward?

Enrique A. Conterno

CEO & Director

Yes. I think the position that FibroGen has, I think, is very strong from a cash perspective. Keep in mind that when we look at our investments, when we look at roxadustat, for example, all of our clinical development and commercial expenses outside of China are really paid by our partners. So we're in a position that we are going to be growing revenue and so forth and basically receiving a royalty in the low 20s. When it comes to China, of course, it's 50-50, but we expect China will be profitable soon. So we have a unique position with roxadustat. In addition to roxa, then, of course, we're making the investments in pam, in research. But the reality is that we expect to build cash over time.

I think your question, if I understand it, is, okay, what do you plan to do with that cash? And right now, I think the focus for us has to be in advancing roxa and making it commercially highly successful, developing and accelerating the development of pamrevlumab to make that a real product with significant benefits across different indications, all of which are -- offer significant value to patients and to FibroGen overall, reignite all of our research. So our internal agenda, I think, is very important.

I will view any type of external efforts right now as a bit distracting given the amount of value we believe we can create organically. That doesn't mean that maybe 9 months from now, 12 months from now, so I'm going to be thinking about what opportunities do we have for that cash. But the timing right now is for us to focus on our execution internally created much value from these programs that can create significant amount of value and then look at maybe 12 months from now, what opportunities do we have strategically. So we think about strengthening the position of the company.

Joel Lawrence Beatty

Citigroup Inc., Research Division

Very good. And I -- we have a couple of minutes left. So I thought I'd squeeze in a question that came in as we were doing this call. And it's a little bit more of a -- more details about the TDAPA payment. And I know that's something you need to sort of file for, so maybe too early to ask. But can you share a little bit more about how those details would work and -- such as would it be like a whole payment to reimburse for the cost of HIF in and of itself or would taken to some -- account some differential with ESAs, how does that work?

Enrique A. Conterno

CEO & Director

Yes. I think the regulation today basically looks at TDAPA, basically and that the -- this add-on payments that TDAPA represents basically is qualified as been 100% of the ASP, of the average selling price. So you're going to look at different channels, what the average selling price is in those channels, and that basically become this add-on payment for TDAPA. So there's no offset for the TDAPA payment for not using an ESA or -- well, that is going to be the case, there's no such offset. So in a certain way, it's an important incentive, right, for inclusion of innovation and best-in-class therapies into the dialysis protocols of this -- of the different dialysis organizations.

Joel Lawrence Beatty

Citigroup Inc., Research Division

Got it. And I guess maybe another question related to pricing. And I know it's not something you've shared yet on details on pricing. But would the -- the price for dialysis patients and the price for non-dialysis patients inherently have to be the same or given the different dynamics there, would they be different?

Enrique A. Conterno

CEO & Director

Yes. I mean I won't be commenting on pricing strategy and so forth. But I think if you are asking about the list price, list price is going to be the same for the product. The product will be utilized in different settings. But I -- at this point in time, I think we don't intend to provide much of a commentary when it comes to price setting or price strategy until basically the time of launch.

Joel Lawrence Beatty

Citigroup Inc., Research Division

Yes. It totally makes sense. And I think that wraps up the time that we have today. So I really appreciate the discussion. It covered a lot of great topics and ended up being great timing to have this discussion today. So Enrique, thanks very much.

Enrique A. Conterno

CEO & Director

Joe, thank you very much. I very much appreciate the time today.

ANALYSTS

Albert Hwang; Morgan Stanley; Managing Director

Presentation

Albert Hwang; Morgan Stanley; Managing Director

Good afternoon, everybody. Thank you for joining. This is the FibroGen fireside chat. I'm Albert Hwang from Morgan Stanley. Thanks for being at the conference. And I'd like to introduce the CEO of FibroGen, Enrique Conterno, who -- maybe you can give a couple of minute overview on how things are going with the company. And then we can get started with questions. Enrique?

Enrique A. Conterno

CEO & Director

Very good. Thank you, Albert. Thank you very much for the invitation. We have an exciting agenda here at FibroGen. Clearly, roxadustat being commercialized in China and Japan, very much undergoing the final stages of the regulatory review in the United States, submission in Europe. Clearly, a transformational medicine when it comes to CKD anemia.

We are making progress with pamrevlumab on enrollments on a collective of high need medical indications whether it's IPF or LAPC or DMD. So now we basically have Phase III programs in each one of those indications. And I would say we're very excited when we think about IPF, I think, our Phase II data. And what we have, I think, is superb. So very excited about that particular asset.

And finally, I think we are really putting a lot of effort behind our overall research agenda, bringing new products into the clinic here at FibroGen, and recently, we hired a new Chief Scientific Officer, Percy Carter. I'm very excited about the opportunity to truly make innovation, a constant stream here at FibroGen bringing new molecules into the clinic. So I'm very excited with an agenda across all fronts. Albert, I think you are on mute, right now.

Question and Answer

Albert Hwang; Morgan Stanley; Managing Director

They always tell you to mute, and then I always forget. So we'll get into detail on all of those fronts. I think maybe the first thing to focus on is probably a question that's on everybody's minds. And that is how do you think about roxa as different from vada, the Akebia product, given their recent non -- NDD data? So do you look at that as a -- every drug is specific to its own targets? Or do you look at it as a mechanism effect, et cetera?

Enrique A. Conterno

CEO & Director

Yes. Clearly, that's a question that is coming often to us, and I'll provide, I think, an appropriate perspective in terms of trying to put that result into context for investors. I'd like to make 3 points. Number one, roxadustat has a very significant data set in MDD. We have a pool analysis in NDD that we submitted to the FDA. As part of our NDD pool analysis, when we look at MACE, we were non-inferior relative to placebo, which is a higher bar than ESAs would be. So we feel very good about our data there.

Point two is we -- in addition to that post study, we have an additional study, DOLOMITES, against an active comparator in darbepoetin. That study had MACE outcomes adjudicated. And as part of those results, we saw a MACE result that was favorable to roxadustat, a hazard ratio of 0.81 in that specific DOLOMITES study. So that's an important additional level of evidence, I think, in favor of roxadustat and the safety when it comes to NDD.

Finally, I think it's a question that comes, okay, the data that roxa has is very strong in NDD, but what are going to be the implications from a labeling perspective, given this data. And I think here, I will point out that the FDA -- there's ample pressure by the FDA to look at cardiovascular studies for different products, even when they're within the same class and make sure that the label applies for those products comes from the respective cardiovascular studies that we have when it comes to GLP-1s, cardiovascular studies that were, in some cases, different in results, and you see the labels basically reflect the outcome and the data for each study and the label for that product. That is also the case for GLP-2s of DPP-4s. So we take that to mean that the cardiovascular studies are really vast studies with many patients. And the FDA takes the results from those studies seriously and basically, in summary, applies the respective outcome from the study to the specific product, the specific label.

In short, what I would mention when it comes to our data is that we continue to feel very confident about our prospects overall for us roxadustat, and, of course, specifically in the NND setting given the data that we have.

Albert Hwang; Morgan Stanley; Managing Director

Okay. And your PDUFA date, just to remind everyone, is December 20 of this year. And the package that you put together for the FDA, and please share what you're comfortable with but, is mostly the 6 studies, 3 for NDD and 3 for DD, and is there any additional data that, you mentioned that you have this additional trial, I think you said it was a DOLOMITES one, that has the comparator with darbe? Would that information be shared as well? Do you try to share as much as possible? Or how does that work?

Enrique A. Conterno

CEO & Director

Yes. I think when it comes to the submission to the FDA, we agreed with the FDA prior to submission on the studies that will be pooled for MACE, 3 specific studies when it comes to DD and 3 specific studies when it comes to NDD. And we have also agreed on the statistical method of how we were going to look at MACE on those studies.

Clearly, when it comes to the submission to the FDA, we include all of our studies. So the ones that are pooled for MACE as well as some of the additional studies that we may have conducted. So yes, I think the DOLOMITES data that we had at that time was also submitted to the FDA.

Albert Hwang; Morgan Stanley; Managing Director

Okay. Great. Okay. So we'll -- I'm sure everybody will be looking forward to the December PDUFA.

Maybe moving on to China. I think it would be helpful to just talk about how the China business is doing broadly after launch. And perhaps if you can talk about what the read-through could be for the U.S. and rest of the world? And if that is a read-through or how things are different or how things are harder or easier in China?

Enrique A. Conterno

CEO & Director

Yes. As you are aware, we got reimbursement in China. Starting this year, we are in the NRDL. Post NRDL, I think key critical success factor for launches to ensure listings in hospitals. And we've done a fantastic job. I think -- AstraZeneca is our partner in China, we basically have a 50-50 profit share for the roxa business in China with AstraZeneca. They've done a fantastic job really listing roxadustat in many hospitals. So we made a lot of progress.

At the end of Q2, we were already listed in hospitals that represented 45% of the overall CKD anemia opportunity in China, and that's very impressive. We had \$5 million in sales in Q1, \$15.7 million in Q2. And we see continuous progression when it comes to revenue, demand that we basically see. So the underlying business, I think, is very strong in China. We are very pleased with the progress that we have.

We, of course, look at China and the -- on its own merit in terms of this can be a blockbuster product, just looking at China alone. So a very significant opportunity for us with roxadustat in China. And -- but of course, we also try to learn from China, what can we apply to other markets, including the U.S. So we capture a lot of those learnings. Of course, the adoption that we have for roxadustat in China is brings -- give us a lot of confidence in terms of what we could expect in other geographies.

So one of the learnings or things that we've seen in China is we've seen probably faster uptake in NDD than maybe at least than I had expected. So -- which is, I think, very encouraging. And when we look at the broad use of roxadustat in China, whether it's home dialysis, dialysis in general or late-stage NDD or NDD in general, we -- I basically see lots of opportunities for roxadustat to grow over the long term. A great opportunity for us to capitalize in China, and we've got to capture those learnings and apply them in the U.S. when relevant.

Albert Hwang; Morgan Stanley; Managing Director

I think it will be helpful to just highlight some of the key numbers in terms of addressable market. Obviously, there's a much bigger population, but at least I'm not familiar with is the dialysis population similar to the U.S.? Is it higher or lower? What about non-dialysis? And how has that been growing? Or how has that been changing?

Enrique A. Conterno

CEO & Director

Yes. So the dialysis market in China is actually the largest dialysis market in the world. We estimate somewhere 700,000 to 800,000 patients on dialysis alone. We see that market growing pretty fast year-on-year. In fact, in China, there's 1 million to 2 million additional dialysis-eligible patients that should be maybe or could be in dialysis, but are not in dialysis today.

In addition to that, we estimate that the market in China could be maybe an additional 5 million patients when it comes to NDD, as we think about the addressable market for us in China. So it's really a really significant opportunity and I would highlight that we are basically going to be the only HIF who are really creating this new market, but the only HIF for quite some time. We don't expect other HIFs until maybe 2024. So great opportunity for us to build a great business, I think, in China.

Albert Hwang; Morgan Stanley; Managing Director

Okay. Great. And can you maybe remind us of the partnership with AZ? And how much you contribute to the sales and marketing? Or how -- I guess, how you're educating yourself for other markets through the maturity of the China piece?

Enrique A. Conterno

CEO & Director

Yes. So allow me maybe to provide a broad perspective on roxa partnership and then I'll specifically address China. But when we think about roxadustat, basically, all of our commercial and development expenses, so new indications, as you know, we are pursuing chemo-induced anemia. We're pursuing MDS, potentially other additional indications beyond those. All of those expenses really are paid by our partners. When we think about commercial expenses, similar.

So everything basically, expenses development or commercial outside of China are paid by the partners. In China, we basically go 50-50 with AstraZeneca, where we have a 50-50 profit share. In the rest of the markets, we are under a royalty transfer price type of arrangement, where we're getting a royalty in the low to mid-20 in terms of percentage. So it's very attractive for us. We have a major transformation of products, and we are very active, of course, in China, given the 50-50 share.

We're trying to rely on the strengths of AstraZeneca in China, so they do much of that -- or all of the sales and marketing efforts. And in our case, it's basically medical and the science and the things that FibroGen could contribute best. So I think the arrangement of the partnership, the collaboration in China, I think, is working well. We recently updated our agreement in China with AstraZeneca to better align both parties, which I think is excellent, that, that agreement provides more predictable and better profitability also for Fibro.

Albert Hwang; Morgan Stanley; Managing Director

Great. Okay. And hopefully, as that business grows, the -- and your investor base will start to see more of the value that, that produces and I guess the synergies that it has with the rest of the business.

Maybe moving on to pamrev. Can you just very quickly highlight the asset, the mechanism before we get into some of the questions, just what it is, what you're going after?

Enrique A. Conterno

CEO & Director

Sure. Pamrevlumab is a monoclonal antibody basically an anti-CTGF. CTGF is a major fibrotic pathway. And really, we have an asset in Phase III, in 3 different indications now in Phase III. And we're very much excited about by some of the data that we've seen. Clearly, IPF, idiopathic pulmonary fibrosis, is a very important indication for pamrevlumab. In IPF, we had outstanding Phase II data I mentioned, and I highlight that our Phase II data, I believe, is -- the effect size that we saw on our Phase II data is better than any data that I've seen with IPF that I'm aware of on products that are either marketed, that today are standard of care or products that are in development.

So very excited about the ability to have an asset with a very differentiated profile. The key for us with that asset is execution and ensuring enrollment. We made a lot of progress when it comes to site activation over the last few months. But clearly, enrollment right now, in particular, because of COVID and the vulnerability of this specific population is a challenge. But I feel good about our ability to recruit quickly now that we have all those sites activated.

We also have LAPC, locally advanced pancreatic cancer, another exciting opportunity for us. We had the Phase II data that was promising. Clearly, here, we are looking at improving the resectability of the patients that are on the pamrevlumab arm, and there's a lot of evidence that shows that improved resectability, you're able to resect, survival improves in oncology. So great opportunity for us with that indication.

And finally, with DMD, we just started that trial in DMD.

Our Phase II trial in DMD was open-label, and we did not have a comparator, but when we look at the progression of the disease in those patients, it is -- we're very encouraged by what we see.

So each one of these indications alone is very significant, but collectively, I think it's a massive opportunity for FibroGen and great opportunity for patients.

Albert Hwang; Morgan Stanley; Managing Director

Okay. And on the IPF side, you touched on it previously. Has the COVID environment impacted enrollment? I know a lot of pulmonary companies, patients tend to stay at home. Has that impacted you? And how do you see that going forward? Or how have you been trying to mitigate that?

Enrique A. Conterno

CEO & Director

Yes. So yes, we do see that. And clearly, in fact, we actually paused enrollment formally on the trial for a few months. And even to this day, we have a number of sites that are still not enrolling based on a decision that they've made at that site due to COVID.

Clearly, this is very much understandable given the vulnerability of these patients, in particular, to COVID-19. There are number of things that we've done. First, I think let's utilize this time to ensure that we can have as many sites activated so that when the situation with COVID improve, we can be hitting on all cylinders when it comes to enrollment. So that's one. We've done geographic expansion of pam in IPF and also in LAPC. So we've looked at a number of additional countries. And we've also expanded in some of these countries. And in fact, as we look at our enrollment in places where, for example, South Korea, where COVID is much more contained, we actually see a very good enrollment with pam. We are --we've gotten approval to conduct a trial in China. So that's also coming. So we're going to be hitting on all cylinders. I think we've prepared ourselves well to ensure that we can recruit as quickly as we can.

Albert Hwang; Morgan Stanley; Managing Director

Okay. And just as you think about the IPF strategy going forward, you are enrolling for naive patients or Esbriet experienced or combination? Can you describe that trial?

Enrique A. Conterno

CEO & Director

Yes. We are enrolling both naive patients and also patients that have been treated with the standard of care and maybe failed or could not tolerate the standard of care. So we're treating both types of patients depending on the different trial, also depending on the country. This particular strategy, I think, is manageable and doable for us given what we see the profile of -- the pamrevlumab could have, meaning given the large effect size that we can have. We also believe that the upside for this product is for surely to be modifying from a disease progression perspective.

We've seen, of course, imaging from our Phase II trial, and that's really unique data where we basically see basically improvements in fibrosis. So my -- if all of the stars align here, I think we could have truly a product that not only shows good outcomes when it comes to forced vital capacity, which is the typical outcome for products in IPF, but actually has a unique opportunity to show improvements when it comes to disease progression itself. And if we do that, I think sky is the limit.

Albert Hwang; Morgan Stanley; Managing Director

Okay. Great. And for all of these programs, what are some of the near-term milestones? Or when can we expect you to give guidance on milestones for these?

Enrique A. Conterno

CEO & Director

Yes. So stay tuned because we plan to provide some of those time lines soon. We have highlighted that we expect to provide time lines on each one of our programs at the Q3 earnings call. So you should expect

time lines when it comes to each one of the pamrevlumab Phase III studies and the roxa MDS and CIA studies. We do intend to provide those milestones and timing.

Albert Hwang; Morgan Stanley; Managing Director

Okay. I guess -- and kind of bigger picture corporate. Since you've joined in the beginning of the year, you've made a few key hires. Can you talk a little bit about what you've done and where you plan on taking the company with those key hires?

Enrique A. Conterno

CEO & Director

Yes. Clearly, I think we made a number of key hires, some that are pretty public, some that are -- that we are continuing to strengthen our bench strength here at FibroGen. I think the 2 that you're referring to are our Chief Commercial Officer and our Chief Scientific Officer. I'm delighted that both Thane Wettig and Percy Carter, respectively, have joined FibroGen. Clearly, FibroGen is transitioning from being just a purely development company to also have a commercial presence. Not only with -- of course, with roxa, but we need to start planning for pamrevlumab as well. So that's critically important.

And I had the chance to work directly with Thane for over 10 years. So I'm delighted that he and I are working together again. And then Percy Carter, Percy has a very -- an important storied career. BMS and most recently, Janssen. And I think that is a reflection that we want top talent to be coming to FibroGen. In this particular case, a reflection of our aim that we have with our overall scientific and research agenda and to be able to leverage the size that we have when it comes to HIF biology, CTGF biology and bring new products into the clinic. So very excited about both hires and the value that they could add to our agenda at FibroGen and ultimately to patients.

Albert Hwang; Morgan Stanley; Managing Director

Okay. So the Chief Commercial Officer understood your PDUFA date coming up. The Chief Science Officer -- is there more that we expect to see from FibroGen beyond pamrev and roxa?

Enrique A. Conterno

CEO & Director

Absolutely. So I think that's the entire idea. I think our aim is to be able to deliver a constant stream of innovation coming from our preclinical efforts. And clearly, the proof of the pudding is how well can we build a pipeline, a clinical pipeline, and I'm excited with the experience and the level of expertise and leadership that Percy Carter will be able to bring to FibroGen.

Albert Hwang; Morgan Stanley; Managing Director

Okay. Great. Okay. Well, we have a few minutes left. I thought maybe I'd give you a chance to talk about anything that I've missed. I think I've gotten the questions in the queue answered. And just an overall closing remarks.

Enrique A. Conterno

CEO & Director

Yes. No, it's an exciting time for us. Clearly, we are in the final stages of basically a regulatory process in the United States. Clearly, our commercial preparations are in full swing.

Reimbursement in the United States will be key. We feel that we have a clear path towards reimbursement in both the dialysis setting and the non-dialysis setting. In the dialysis setting, we expect to be eligible for TDAPA reimbursement. This is an additional payment over and above the bundle. And we are planning and preparing to apply for the TDAPA reimbursement as soon as we get approval through AstraZeneca.

So TDAPA, just to remind you, is basically an additional payment that the organization will receive as a result of using roxadustat, that is based on 100% of the average selling price. So excited about that opportunity.

And we believe that our reimbursement to TDAPA could be effective as early as April 1, given the time lags that we basically expect. So clearly, reimbursement is key in both dialysis and the non-dialysis setting for roxa. We have made a number of changes to improve our enrollment when it comes to our pam studies. I'm highly confident on some of the changes that were made and the impact that, that could have in ensuring faster enrollment that has been typical.

And stay tuned for what -- we expect to have an Analyst Day, Analyst Meeting in Q1 of next year, where we expect to showcase a lot more of all of our plans, including some of the plans that we basically have when it comes to research.

Albert Hwang; Morgan Stanley; Managing Director

Okay. Great. It looks like you're going to have busy next couple of quarters. So wish you the best of luck. And thank you for taking the time today.

Enrique A. Conterno

CEO & Director

Thank you very much, Albert. Very much appreciate it.

Albert Hwang; Morgan Stanley; Managing Director Okay. All right. Bye-bye.

Presentation

Operator

Ladies and gentlemen, thank you for standing by, and welcome to the FibroGen Third Quarter 2020 Financial Results Conference Call.

[Operator Instructions] Please be advised that today's conference call is being recorded. [Operator Instructions]

I would now like to hand the conference over to your first speaker, Mr. Michael Tung. Thank you. Please go ahead.

Michael Tung

Investor Relations Executive

Thank you, Robert, and good afternoon, everyone. I'm Michael Tung, Vice President of Corporate Strategy and Investor Relations at FibroGen. Joining me on today's call are Enrique Conterno, our Chief Executive Officer; Dr. Percy Carter, our Chief Scientific Officer; Pat Cotroneo, our Chief Financial Officer; Thane Wettig, our Chief Commercial Officer; Dr. Peony Yu, our Chief Medical Officer; Chris Chung, our Senior Vice President of China Operations; and Dr. Elias Kouchakji, our Senior Vice President of Clinical Development, Drug Safety and Pharmaco Vigilance. The format for today's call includes prepared remarks from Enrique and Pat, after which, we will open up the call for Q&A.

I would like to remind you that remarks made on today's call include forward-looking statements about FibroGen. Such statements may include, but are not limited to, our collaborations with AstraZeneca and Astellas; financial guidance; the initiation, enrollment, design, conduct and results of clinical trials; our regulatory strategies and potential regulatory results; our research and development activities; commercial results and results of operations; risks related to our business and certain other business matters. Each forward-looking statement is subject to risks and uncertainties that could cause actual results and events to differ materially from those projected in that statement. A more complete description of these and other material risks can be found in FibroGen's filings with the SEC, including our most recent Form 10-K and Form 10-Q. FibroGen does not undertake any obligation to update publicly any forward-looking statements, whether as a result of new information, future events or otherwise.

The press release reporting our financial results and business update and a webcast of today's conference call can be found on the Investors section of FibroGen's website at www.fibrogen.com.

And with that, I would like to turn the call over to Enrique Conterno, our CEO. Enrique?

Enrique A. Conterno

CEO & Director

Very good. Thank you, Mike, and good afternoon, everyone, and welcome to our third quarter 2020 earnings call.

We're making a strong progress on our commitment to bringing our potential first-in-class medicines to patients suffering from chronic and life-threatening conditions despite the challenges presented by the COVID-19 pandemic. I will begin today's call by providing a high-level summary of the most important accomplishments and developments from the last few months. Pat Cotroneo, our CFO, will then review the financials. After which, we will open up the call to your questions.

Today's call will include a high-level review of the roxadustat data from the recent American Society of Nephrology Conference, our continued strong China results and updates on roxadustat and our clinical trial programs. So let us get started with the recent ASN meeting.

This year at ASN Kidney Week, alongside our partners, AstraZeneca and Astellas, we presented new analysis on roxadustat, our investigation of first-in-class oral treatment for patients with anemia of CKD.

Together with our partners, we had 42 presentations, including 10 oral, which add to the understanding of roxadustat's efficacy and safety profile and the unmet need -- and the unmet medical need in anemia of CKD. The roxadustat clinical data demonstrated consistent efficacy and reassuring safety results across the continuum of CKD patients with anemia, adding to the established body of evidence highlighting roxadustat as a potential foundational treatment for this condition affecting millions of patients. We also presented data on the significant burden of anemia of CKD, a reminder that new treatment options for these patients are sorely needed.

On the efficacy front, a major goal in treating anemia is to reduce the risk of red blood cell transfusions, a significant risk for CKD patients. And roxadustat demonstrated a statistically significant improvement in this important clinical measure. The efficacy results were consistent across a wide range of patient populations, including non-dialysis-dependent, incident dialysis, dialysis-dependent and peritoneal dialysis, and included analysis in patients with diabetes, heart failure and systemic inflammation. Roxadustat demonstrated the ability to consistently maintain hemoglobin levels above 10 in the vast majority of patients. And data from the trial suggest that the risk of transfusion increased four to fivefold in patients with hemoglobin levels less than 10 versus those with hemoglobin levels greater than 10, regardless of treatment.

Moving to safety. Two late-breaking abstracts explored cardiovascular outcomes of patients with anemia of CKD treated with roxadustat, including the associations of MACE and MACE+ rates at various hemoglobin levels. In this post hoc analysis, patients who achieved hemoglobin levels above 10 had lower rates of MACE and MACE+ than patients who achieved hemoglobin rates below 10. Another presentation of an exploratory analysis showed a lower rate of hospitalization for heart failure in dialysis-dependent CKD patients treated with roxadustat when compared with epoetin alfa. Finally, multiple presentations reinforced roxadustat's safety profile related to neoplasm, hypertension and ophthalmological effects.

In summary, roxadustat was a highlight of the ASN conference with 20 of the top 10 viewed posters, including the top 2. We appreciated a widespread interest with the potential for roxadustat to transform the treatment of patients with anemia of CKD.

Moving now to China. In China, we're pleased to report net sales of roxadustat of \$22.7 million for the third quarter versus 15.7% in the second quarter. We're seeing an increase in uptake, which is being driven by both an expansion in hospital listings and broad adoption with enlisted hospitals.

Hospital listings continue to be a key focus of our launch efforts. Notably, as of the end of the third quarter, roxadustat was listed at hospitals representing approximately 55% of the CKD anemia market opportunity in China. This is in comparison to the 45% reported at the end of the second quarter.

We continue to see significant roxadustat utilization across the range of different patient populations with anemia of CKD. About 2/3 of patients from roxadustat are on dialysis, split between hemodialysis and peritoneal dialysis, and within hemodialysis, initial adoption has been in patients who do not respond well to ESAs as well as incident dialysis patients. This broad utilization pattern bodes well for long-term success and provides important learnings as we prepare to launch roxadustat in the U.S. and other countries. We look forward to keeping you updated as we advance our long-term goal of making roxadustat the standard of care in treating China's CKD anemia patients.

Let us turn now to the U.S. regulatory review and commercial preparation for roxadustat. We continue to be pleased with the cadence of and engagement with the FDA. And as we have discussed previously, we will not be making comments on the ongoing interactions with the FDA. We and AstraZeneca are working closely on U.S. launch preparation activities.

Assuming a positive decision by a PDUFA date of December 20, the plan is to immediately apply for the Transitional Drug Add-on Payment Adjustment or TDAPA, which would provide reimbursement for roxadustat for dialysis-dependent patients outside of the prospective payment system bundle. The earliest roxadustat could receive TDAPA coverage would be April 1, 2021. And should that occur, the official launch within the dialysis organizations would commence.

Assuming approval, roxadustat will be available in the first quarter of 2021 and we plan to officially launch in a non-dialysis-dependent setting in the second quarter of 2021. Disease awareness activities and discussions with payers are well underway. We have submitted manuscripts covering the Phase III data for publication, both for the individual trials and pooled data sets, and expect to have them at the time of launch.

Finally, we continue to work with large dialysis providers on our 2 ongoing Phase IIIb roxadustat clinical trials in the U.S. dialysis setting. In Europe, the filing for roxadustat for the treatment of anemia in adult patients with CKD, both on dialysis and not on dialysis, is under review by the European Medicines Agency. In Japan, the sNDA filing for the indication of anemia of CKD in non-dialysis-dependent patients is under review and we continue to expect the decision by year-end.

Moving now to our pipeline, I would like to provide time line guidance for our clinical trials. Please note that the COVID-19 pandemic continues to present challenges to the conduct of clinical trials across our industry, and we continue to monitor the situation and will take actions as necessary.

Starting with roxadustat. For our Phase III trial in myelodysplastic syndromes or MDS, we expect top line data in the first half of 2022. For our Phase II trial in chemotherapy-induced anemia or CIA patients, we expect top line data in the second half of 2021, and if successful, plan to quickly initiate the Phase III program.

Moving now to pamrevlumab. As we have mentioned over the prior months, the most affected of our trial continues to be pamrevlumab's ZEPHYRUS IPF trial, in which we paused enrollment due to the vulnerability of these patients with severely compromised lung function. Unfortunately, the current COVID situation continues to be extremely challenging for enrollment and has also delayed the initiation of ZEPHYRUS-2. As such, we will be providing guidance for pamrevlumab in LAPC and DMD, but not on IPF at this time. Given the different COVID scenarios, there is variability in our projected IPF enrollment time lines, and we will continue to evaluate and plan to update you at the appropriate time.

In August, we initiated LELANTOS, a Phase III trial of pamrevlumab in approximately 90 patients with non-ambulatory Duchenne muscular dystrophy or DMD. And we expect top line data in the second half of 2022. We also plan to initiate a second Phase III trial, LELANTOS-2, in approximately 70 patients with ambulatory DMD.

Finally, for LAPIS, our Phase III trial in locally advanced unresectable pancreatic cancer, we expect top line restriction data in the second half of 2022. We remain focused on accelerating enrollment of all of our ongoing clinical trials while ensuring patient safety.

Lastly, I want to welcome Kirk Christoffersen, who has just joined FibroGen as Chief Business Officer, with responsibility for business development and alliance management and reporting to me.

I will now turn the call over to Pat Cotroneo, our CFO, to review the financials. Pat?

Pat Cotroneo

Chief Financial Officer

Thank you, Enrique.

As announced today, total revenue for the third quarter of 2020 was \$44 million as compared to \$33.2 million for the third quarter of 2019. The current quarter revenue consists of net product revenues of \$22.7 million for roxadustat sales in China, \$20.7 million in development revenue, \$2.3 million for sales of bulk drug product to AstraZeneca and a net reduction of \$1.7 million for certain adjustments. For the same period, operating costs and expenses were \$11.7 million and net income was \$33 million or \$0.36 per basic and \$0.35 per diluted share as compared to operating costs and expenses of \$86 million and a net loss of \$49.4 million or \$0.57 per basic and diluted share for the third quarter last year.

As mentioned in our last quarter's call, we recently amended our China collaboration with AstraZeneca. The new agreement more optimally aligns both FibroGen and AstraZeneca to maximize the economic value

of the roxadustat franchise and will result in improved and more predictable economics and profitability for FibroGen.

Under this amendment, in September 2020, FibroGen Beijing and AstraZeneca completed the establishment of a joint distribution entity that will perform roxadustat distribution as well as conduct sales and marketing through AstraZeneca. We amended the collaboration in a number of ways, including establishing the cap on sales and marketing expenses. Historically, these co-promotion expenses were billed to FibroGen and payment was deferred until certain profitability and liquidity provisions were met. At that time of the amendment, we also settled the historical co-promotion costs for both parties to reflect an equal sharing of historical losses and made an adjustment of the co-promotion expenses. As a result of these changes, we reversed approximately \$84.4 million of co-promotion expenses, which were recorded as a reduction to selling, general and administrative expenses in the third quarter of 2020.

Once the distribution entity is fully operational, FibroGen is expected to recognize revenue based on its sales to the distribution entity, while AstraZeneca is expected to consolidate the distribution entity and recognize revenue on sales to customers. This amendment better aligns the parties' interest and is expected to enable profitability for roxadustat commercialization in China at an earlier point in time.

Included in operating costs and expenses for the quarter ended September 30, 2020, was an aggregate noncash portion totaling \$23.6 million, of which \$17.9 million was a result of stock-based compensation expense as compared to an aggregate noncash portion of \$19.6 million, of which \$14.8 million was a result of stock-based compensation expense for the same period in the prior year. At September 30, FibroGen had \$719.3 million in cash, cash equivalents, restricted time deposits, investments and receivables.

Looking ahead, we have a total of \$245 million in potential milestones expected over the next 9 months for anticipated U.S. and EU approvals and first commercial sale in the U.S. At this point in time, we have no changes in expectations in any of the anticipated milestones between now and mid-2021.

Based on our latest forecast data, we now estimate our 2020 ending cash, cash equivalents, restricted time deposits, investments and receivables to be in the range of \$770 million to \$780 million, assuming U.S. NDA approval in Q4 2020.

Thank you. And I would now like to turn the call back over to Enrique.

Enrique A. Conterno

CEO & Director

Thank you. And in summary, FibroGen is well positioned to continue to make progress in the current environment. Our business continuity plans are in effect and we're seeing some impact to operations resulting from COVID-19. We have the capabilities and resources to navigate through these uncertain times and achieve our stated goals.

As roxadustat sales ramp-up in China, our financial position is strong, with approximately \$720 million in cash at the end of the third quarter and a total of \$245 million in approval and first commercial sales milestones expected over the next 9 months. We received full partner reimbursement for all development and commercialization of roxadustat in all geographies except China, where we shared these expenses 50/50 with AstraZeneca. We have an excellent cash position with which to advance our research and development agenda and are looking forward to the roxadustat regulatory decision in the U.S. by yearend.

Robert, if you could now open the lines for questions.

Question and Answer

Operator

[Operator Instructions] We'll have our first question coming from the line of Michael Yee with Jefferies.

Michael Jonathan Yee

Jefferies LLC, Research Division

Congrats on the progress, particularly in China. I had a 2-part question. One was regarding the big picture implications of whether a drug has a black box or not. And while AstraZeneca had some very nice comments this morning, I guess, for investors, is there an implication to the opportunity? Or do they use -- I'm sure you've thought about this, whether a drug has a black box or not. So maybe just run through what those things might mean.

And then the second question relates to the ASN presentation, which you nicely summarized. And I guess, the idea that having less cardiovascular events as hemoglobin goes up seems very good, but that's, of course, how Amgen maybe got in trouble later on. What is the implication of that towards thinking about cardiovascular safety? And don't you need to show the control arms as well?

Enrique A. Conterno

CEO & Director

Very good. Thank you, Michael. And let me try to address the first question. I'll try -- we'll try to answer the second question here with Peony as well.

In terms of the box warning, there are a number of scenarios. And let me just remind everyone that we are not planning to comment or speculating on what our interactions with the FDA are right now. But there are a number of -- you can speculate about a number of potential scenarios, if you wish.

So on one side, you can take basically no box warning on -- across any of the indications. Maybe to the other end, you can say, well, we have a box warning that reads like the box warning that ESAs have. Clearly, somewhere in between, maybe a box warning that maybe reads a little bit differently than what the ESAs' box warning is.

As we think through this, clearly, when -- first, when we look at the dialysis setting, it is pretty clear that, today, I think the products that are being utilized for treatment -- and patients are treated for anemia in the dialysis setting in the vast majority, we have those products being a -- having a box warning. So in this particular setting, having a box warning, it is not a disadvantage for use, right? So clearly, not having a box warning is even better, but it's -- I view that as something very manageable given the current setting.

When it comes to NDD, we are -- in this particular setting, we have most of the patients being untreated. So it's an opportunity to basically build the market and make the case for roxadustat as a compelling value proposition to be able to treat these patients. But it's a different situation because we are trying to increase treatment rates and ensure that instead of having 1 out of every 10 patients being treated in that setting, that we can move truly the needle over time.

Clearly, in that setting, a box warning actually would slow the uptake, in particular the initial uptake as physicians get more comfortable with utilizing the product. So that's maybe some of the frame that -- I don't see longer term, when we think about the absolute addressable market, that being a huge issue, but it will slow down the uptake in the near term.

In terms of your second question on ASN, and I think you are referring to the data that we presented on achieved hemoglobin levels and corresponding MACE outcomes. Just to recap what the -- what our interpretation of this analysis say, is basically that we basically saw higher rates at hemoglobin levels below 8, very high rates of MACE. Rates of MACE decrease as hemoglobin increased. And for hemoglobin above 10, we basically saw the lowest rates of MACE and MACE+ events.

And this data was quite consistent. This pattern was quite consistent in both DD and NDD. We -- our intent of that analysis -- I think it's important data, but to me, I think the #1 interpretation of that analysis -- and let's keep in mind that this is a post hoc analysis, right? So we need to view it that way. It's just mining the data that we basically have from Phase III trials, we should do so, they are exploring -- we should view them as exploratory analysis.

But I think the #1 take is that anemia needs to be treated. And we need to treat it seriously because, clearly, what we basically see is that for low rates -- when hemoglobin is low, we basically see high rates of anemia. By the way, this -- also below 10, we saw transfusion rates increase almost four to fivefold. So it is basically -- our own interpretation is basically around treatment of anemia and the importance of doing so from a medical perspective.

Operator

Next question will be coming from the line of Jason Gerberry with Bank of America.

Unknown Analyst

This is [Fadi] on for Jason. Can you help explain the market dynamics in China? Based on data from AstraZeneca today, the patient numbers more than doubled from 40,000 to 90,000 from 2Q to 3Q, but sales -- the sales increase did not match that rise in the number of patients. Can you help explain that?

Enrique A. Conterno

CEO & Director

Yes. Let me try to provide some color on China. And then I'm going to ask Chris Chung to also help provide some additional commentary.

Clearly, we are very pleased with our China launch. We achieved reimbursement at the beginning of the year. And as of the end of Q3, we are already listed in 55% of the hospital. This is really quite extraordinary as we look at comparable launches, even of products that have become very significant products in China. So very significant listing progress, and that is key and I think it's a great signal for long-term success.

In addition to that, of course, we're seeing the adoption within those listed hospitals. And we just reported basically \$22.7 million in the Q3 versus the \$15.7 million that we reported in Q2, so good consistent progress. And when we look at the underlying business fundamentals, I consider them to be very, very strong.

Right now, I think we view that roxadustat has the potential to become what I would describe as a blockbuster in China. I would define that as a product that has revenue north of \$0.5 billion, so \$500 million. So very significant opportunity, and we're launching well to be able to try to aim towards that.

Clearly, we also see our utilization across a breadth of patients, which I think is very important as we think about long-term success. Many different opportunities for us to grow with different segments.

As it relates to your question, my understanding -- I'll ask Chris to confirm because -- but the number of patients that were reported by AstraZeneca, they were cumulative patients as opposed to the patients in the quarter. And as you know, the duration of -- there are some patients that stop treatment, some patients that stop treatment. So I don't think that we will be able to just do a calculation that we increase the number of patients and we're going to double the demand. But we're very pleased in terms of where we are and the opportunity to have roxadustat start benefiting so many patients in China.

And Chris, maybe if you could comment?

Christine L. Chung

Senior Vice President of China Operations

Sure, Enrique. So very quickly, to supplement what Enrique said, the sales we report are ex-factory sales. I think patient points more to demand sales in terms of what is actually sold to the patient -- to the

hospitals and what's actually prescribed. So I don't know that we could directly link the 2 in that linear of a manner.

As Enrique said, there's tremendous uptake, but still we're at the early launch stage where there's some new patients, new prescribers who are just getting on drug. We're trying to track the DOT as best we can, but there's a lot of variability. At this time, it's very difficult to link demand to the number of patients, but as you can see from our ex-factory sales, it's a very robust trajectory, and we remain very optimistic in terms of what this tells us about the market opportunity.

Operator

Next question will be coming from the line of Annabel Samimy with Stifel.

Annabel Eva Samimy

Stifel, Nicolaus & Company, Incorporated, Research Division

So I had a question about what you expect the launch trajectory. I know that in the dialysis population, you expect to ramp relatively quickly. Can you talk a little bit about how you expect -- or how AstraZeneca expects to build the non-dialysis population just beyond some of the reimbursement challenges or hurdles, where do you expect the primary adoption hurdles to be? Given the wealth of data that you have, it seems like physicians can understand the benefit rather quickly, notwithstanding a black box or no black box. So what are some of the considerations you're thinking about in the NDD population?

Enrique A. Conterno

CEO & Director

Yes. Clearly, the 2 settings are different and they also respond to different reimbursement mechanisms. First thing, I think, for a launch anywhere, we need to ensure that roxadustat is going to be reimbursed. So we need to work towards reimbursement in both the dialysis setting. I've commented, as part of my initial comments on our plan to submit for TDAPA, and expect that the earliest date that we could get reimbursement will be April 1, 2021.

In the case of NDD, we are also in discussion with payers. And in this particular case, I think we need to be placed in formularies, in the different formularies. So those arrangements will need to be made and we want to make sure that we are supporting AstraZeneca to be able to have those arrangements as quickly as possible. So that's an important part of thinking about just ensuring that there's going to be adequate reimbursement over time.

We need to think about -- as we think about NDD that -- in this particular case, it is not just about treating the current patients that are being treated. So we need to basically educate the overall marketplace on the importance of treating anemia. And that's why I'm insisting on the comments of some of the benefits when it comes to anemia and some of the comments that I made during the initial comments in this conference call. That is incredibly important that we are upfront. Now roxadustat has, as you mentioned, a number of benefits. So we think that it has the right efficacy safety profile to be able to have a really good uptake in the NDD setting and be able to be a catalyst for the overall expansion of that market.

We -- over time, we're not going to be satisfied with just treating 20% more patients or we need to be thinking about a scaler in terms of expanding this marketplace. And this is going to happen, of course, over time. And to do that, yes, we would need to make sure that we're reaching the appropriate physicians, not only the physicians that are prescribing and treating anemia today, but the ones that we think could -- are seeing those patients that could benefit from roxadustat. But in addition to that, we need to be thinking about patient activation, ensuring that patients understand that there is a new treatment option that is up.

So we have a great partner in AstraZeneca. And we look forward to supporting them and ensuring that we can be as successful as we can be in that setting.

I'm going to ask Thane if he has any additional comments.

Thane Wettig

Chief Commercial Officer

Yes. Thanks, Enrique. Just a couple of additional comments. When we think about the NDD market, we don't think about it as a market build. We think about it as a market rebuild just because of the number of patients who previously have been treated with an ESA that are now not being treated. And you've heard the statistics where about 1 in 7 patients in the 12 months prior to dialysis are treated with an ESA. At one point in time, it was about 1 in 3. And so our first goal will be to ensure that we can rebuild that market on the way to then, as Enrique talked about, scaling the opportunity in a much different kind of scenario as well.

And the second thing is the advantage of working with a partner like AZ is the significant presence that they have from a patient support and affordability program perspective with their internal AZ 360 hub, which we believe will be an important mechanism to ensure eligible patients have the patient support and reimbursement mechanisms in place to assist them in getting and staying on therapy.

Annabel Eva Samimy

Stifel, Nicolaus & Company, Incorporated, Research Division

Okay. Great. And if I could just follow-on one more question. You have quite a bit of cash building, that's only going to get better. You don't have a tremendous amount of expense with the launch. So is there any thought beyond just financing your R&D programs? Any additional thought to business development and things you need to build out?

Enrique A. Conterno

CEO & Director

Yes. So we're not going to be commenting on business development, but yes, that's something, as I mentioned at previous earnings calls, that after this initial phase, the first 9 months or so, which, by the way, I've been now, I think, on my job now 10 months, there will be, I think, an opportunity for us to start thinking about that and be able to think about business development and, in particular, bringing assets or signs that we believe can create significant value for patients and shareholders.

Operator

Next question will be coming from the line of Geoffrey Porges with SVB Leerink.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

A couple of quick questions. First, and I apologize if you've answered this, but what is the latest thinking on the time for the pamrevlumab pancreatic cancer study readout?

And then secondly, could you just confirm, Enrique, what you said about the launch timing for NDD and DD specifically next year, assuming success at the FDA?

And then lastly, is the data about LDL reduction meaningful to physicians and potentially helpful to launch? Or is that something that might be something that you'll be featuring?

Enrique A. Conterno

CEO & Director

Very good. Thank you, Geoff. Just let me first address your question about LAPC. When do we expect a readout? And we mentioned that we expect top line resection data in the second half of 2022.

When it comes to -- your second question was about -- or last question was about LDL and impact of LDL. We think that is a nice marker to have, but at the end, LDL is mainly utilized as a marker for cardiovascular risk. And to that extent, we have cardiovascular outcomes that, in a certain way, are comprehensive to the entire product. So yes, it's good to have the LDL data that we have, showing decreases in LDL, but I think even more importantly, it's basically to be able to showcase our overall cardiovascular safety data.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Okay. And then, sorry, just the timing, specifically for the 2 indications or populations?

Enrique A. Conterno

CEO & Director

Yes. And in terms of launch for the 2, for both DD and NDD, when we are determining the official launch, right, because clearly we expect to make the product available as soon as we can after approval, but we expect that the earliest that we would get TDAPA approval would be April 1, 2021. So that's basically what we're targeting the official launch, given that's really what would be the catalyst for the dialysis organizations to incorporate their products or using the product in the way that they -- we think they could. When it comes to NDD, we expect that the official launch would be also in the second quarter of 2021.

Operator

Next question will be coming from the line of Yaron Werber with Cowen.

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

So I have a couple of questions, Enrique. One is basically a follow-up to what you just saw -- were highlighting. With Fresenius and DaVita, these better than -- are big clinics and they have pathways, and they typically will run pilot programs before they adopt a new drug. I know you've commenced a couple of studies and you're enrolling those studies in those sites. Can you give us an update on that? And how long do you think before you have data? And is it sort of a pseudo or an official pilot program?

And then secondly, on TDAPA, when we look historically at some of the drugs, whether [the irons], and you can argue they're not that innovative, or even Parsabiv, and you can argue Sensipar was out, but launches in dialysis have been pretty slow. And the profit incentive under TDAPA, really it's a small and mid-cap -- mid-chain dialysis providers that typically adopted, but not the big ones. Why would it be different with roxa?

Enrique A. Conterno

CEO & Director

Yes. I'm going to ask Peony to comment on our Phase IIIb studies, which we are conducting with dialysis organizations. Peony, would you like to make some comments?

K. Peony Yu

Chief Medical Officer

Yes. Thanks, Enrique. Yes, we are working with some of the largest dialysis organizations. And the 2 studies are going exceptionally well. This is a an opportunity for the U.S. dialysis organizations to further study our product. And the studies are expected to be finished in the first half of 2021 and will be in time to support our launch.

Enrique A. Conterno

CEO & Director

And in terms of -- thank you, Peony. And in terms of TDAPA, if I understood your question, you're looking at other examples. I will share what my view is here. But having reimbursement doesn't mean that you're going to get use, right? The reason why we believe roxadustat will be utilized is because of the overall clinical profile that it offers, not because it has a favorable -- necessarily a favorable reimbursement scheme.

So we think that roxadustat offers a number of benefits. I think if we think about straight off the bat, in incident dialysis, the excellent data that we have with -- showing basically reduced cardiovascular outcomes in this population, so that's extremely important. Clearly, there are a number of patients, we

estimate maybe about 20% of patients on dialysis, that do not respond well to ESAs or are in very, very high doses in many cases. We think those are also patients that would be -- given the experience that we have in China, we see patients that would be candidates for roxadustat right away. So to us, I think it's the overall benefit -- risk-benefit profile that the product offers.

TDAPA, in itself, I think is important because it allows for the product to be used and to ensure that there's not going to be a negative incentive or a negative economic driver. So if anything, I think it's a positive driver from a reimbursement perspective for the use of the product. So I would look not to TDAPA, but really to the profile of the product to see why we believe that product will be utilized.

Operator

Next question will be coming from the line of Difei Yang with Mizuho.

Alexandre N. Bouilloux

Mizuho Securities USA LLC, Research Division

This is Alex on for Difei. First one, I guess, given that you will be potentially first to market in dialysis, could you give us a bit of color on how you're engaging with the large dialysis providers in the U.S.? And if you would expect to secure contracts with the 2 large providers following approval? Or would you expect to secure contracts maybe in a more staggered manner or just with one of them? And then I have a follow-up.

Enrique A. Conterno

CEO & Director

Yes. Clearly, we want our -- the utilization of the product to be broad. We're not going to be commenting on where are we on our discussions with the different providers. Clearly, we need to make sure that the product will receive approval, but it is pretty clear that we've been working with them pretty closely for quite some time. Keep in mind that we conducted our Phase III clinical trials with them. We are also conducting this IIIb -- Phase IIIb studies with the dialysis organizations. So I feel that we are in a really good position. And also, what is the overall profile of, once again, the medicine that we're offering. And we think that it can be of significant value from a medical perspective so -- to patients and to health care organizations. So we feel good in terms of where we are, I think, in our discussions.

Our intent is not to -- is to try to offer the product to -- and be able to reach as many patients as we can. And clearly, getting TDAPA being effective will be critical towards that goal.

Alexandre N. Bouilloux

Mizuho Securities USA LLC, Research Division

Okay. Great. And then just a quick follow-up, another question on China. I'm wondering if you could provide a bit of color around roxa's uptake, specifically in stable dialysis patients who are already on ESAs. Are you seeing a bit more conversion to roxa from these patients today versus compared to, let's say, 6 months ago?

Enrique A. Conterno

CEO & Director

Yes. I'm going to ask Chris to maybe provide some comments on that.

Christine L. Chung

Senior Vice President of China Operations

So the way we look at the maintenance dialysis market, first of all, is those with controlled hemoglobin levels and uncontrolled hemoglobin levels and also peritoneal dialysis and hemodialysis.

So first of all, we look at the PD population. We've done extremely well in the PD population. It speaks well to the clinical profile of roxadustat. The oral administration feature obviously is additive and attractive to this population for very obvious reasons. So we're doing particularly well in PD.

In terms of HD, there is a very different value proposition for those with uncontrolled hypertension -uncontrolled hemoglobin and controlled. For those that are uncontrolled, really is the initial adoption
population and a target launch population. It speaks very well to the differentiation based on eye
mobilization and inflammation. So the clinical value proposition there is very, very strong, and that's
where we see a lot of the early adopters.

We are seeing migration into the controlled population, and the thesis there is it's important to treat. It's important to treat the target. It's important to maintain so that there's very little low variability. But as a matter of pricing, we are higher than ESA. So the value proposition and the differentiation there is a little bit different, but we're very happy to see migration into that population, which frankly was not the initial focus, but with the maturing launch, we're seeing adoption. So we're delighted to see that.

Enrique A. Conterno

CEO & Director

The last thing that I would say, and you did not ask this question, but clearly, in addition to looking at the stable patients on dialysis, clearly, I think, what we see is really good adoption within the incident dialysis patients, which, at the end, I think, is a great predictor of what the brand could be in the future.

Operator

We have our final question coming from the line of Joel Beatty with Citi.

Joel Lawrence Beatty

Citigroup Inc., Research Division

At ASN, Akebia presented data for vadadustat on their non-dialysis patients, showing that the U.S. MACE looks quite a bit better and it was the ex-U.S. MACE that was really hurting their MACE outcome. I guess, with that in mind, could you characterize how your non-dialysis data looks in terms of any differences between the MACE in the U.S. patients versus patients enrolled ex-U.S.?

Enrique A. Conterno

CEO & Director

Yes. Maybe let me just make some overarching comments because, clearly, our trial is designed a little bit different from vada in terms of we were going, as you know, relative to placebo. But importantly also, we treated 11 plus/minus 1, whether it was in the U.S. and/or OUS. So we did not -- we utilized the same treatment targets for roxadustat.

Now when it comes to roxa, I think what's important is when -- first, when we look at the overall trial, we basically see that in NDD, we were comparable to placebo. So that's when it comes to MACE. So that's critically important. We showed non-inferiority.

The best trial for us to look at, which is not part of our post study, but the first -- the best trial that will be more -- most comparable to the Akebia trials would be DOLOMITES, which is a trial where we compared against an active comparison in darbepoetin, and it was conducted outside of the U.S. So that's -- you're hitting on both points. And the hazard ratio that we saw -- and by the way, we treated to, once again, 11 plus/minus 1, okay? We saw hazard ratio in MACE of 0.81. So honestly, we feel very good about our data.

And I don't know, Peony, if you want to add anything else to that.

K. Peony Yu

Chief Medical Officer

Yes. Thanks, Enrique. Yes, we -- so that -- as Enrique said, that the DOLOMITES study is 100% ex-U.S. and we had a very reassuring hazard ratio. And now in our -- in the placebo control, which is our main program, we saw consistency in the U.S. data with -- that is consistent with the overall MACE program. So we've -- and as you know, that placebo is a high standard for a measurement of safety. And we are glad that we have chosen this standard.

Joel Lawrence Beatty

Citigroup Inc., Research Division

Maybe one other question is also on the competitive landscape. And I think recently on clinicaltrials.gov, GSK moved sooner the time lines for the readouts for daprodustat. It looks like November 2020 for dialysis and April 2021 for non-dialysis. Any predictions there for how the results could look, whether they could resemble your data? Or are there differences to consider?

Enrique A. Conterno

CEO & Director

I think that's a good question for them.

Operator

All right. We don't have any more questions on the line. Speakers, please continue.

Enrique A. Conterno

CEO & Director

Very good. Once again, I appreciate everyone's time today as we report our third quarter results.

We're very pleased with the progress, as I mentioned, across a number of fronts. And of course, we are looking forward to the action date of December 20 for roxadustat, which is the roxadustat PDUFA date here in the United States.

Thank you very much.

Operator

And this concludes today's conference call. Thank you, everyone, for your participation, and you may now disconnect. Have a good day.

EXHIBIT HH

Company Name: FibroGen, Inc. (FGEN) Event: Stifel Virtual Healthcare Conference

Date: November 17, 2020

<< Annabel Samimy, Analyst, Stifel>>

Hi. Good afternoon. And welcome to the FibroGen Presentation. I'm Annabel Samimy, Biopharmaceutical Analyst here at Stifel. And it's our pleasure to have Enrique Conterno with us today CEO from FibroGen. So, you all are reaching a pretty critical juncture here as we approach the PDUFA date for roxadustat in December. So, all the attention is clearly turning to approval and label and of course commercialization.

So, Enrique, why don't you just give us a quick overview of where we are, and I'll just launch into Q&A.

<< Enrique Conterno, Chief Executive Officer>>

Very good, yes. So, thank you, Annabel for the invitation. We're clearly very excited as the PDUFA date approaches. Let me make some general comments about the company, because I know we will discuss a lot about roxadustat, but clearly that's in everyone's attention, I'm very excited about that. But in addition to roxadustat and our progress there, we of course have pamrevlumab, which we are pursuing in three indications in Phase 3 now in IPF, in DMD and also in locally advanced pancreatic cancer.

So, I'm very excited about the opportunities with that specific product. As we've mentioned, I think, we are making good progress in enrollment when it comes to LAPC, of course, DMD just started, but we had some challenges when it comes to IPF because of the COVID situation and those patients being particularly vulnerable. Outside of the two specific programs, roxa and pam, we also have made – we're making significant investments in research as we think about bringing the next generation of products into the clinic. We hired Percy Carter and he's our Chief Scientific Officer and I'm pretty excited about the progress and the plans that he has to make sure that we can have a research engine that has a sustainable output from a program perspective into the clinic. So, excited to be here at FibroGen, it is an exciting time for us. Annabel, we're not hearing you.

<< Annabel Samimy, Analyst, Stifel>>

Okay, great. Can you hear me now?

<< Enrique Conterno, Chief Executive Officer>>

Yes.

<< Annabel Samimy, Analyst, Stifel>>

Okay, great. Sorry about that. So, just as you rightly noted we are going to be spending a lot of time on roxadustat. So why don't I just launch into that? So not wanting to put

cart before the horse here, we do need approval for the product. I think The Street by now has accepted there'll be no AdCom. I still get the question. It's a disease area that's obviously been fraught with a lot of post-approval safety issues with a new class. So just help us understand that with — what the FDA's reasoning here was for no FDA panel. I imagine they want to cover their bases, but just their comfort level with this space maybe is what got them there. So why don't you provide us some color around that?

<< Enrique Conterno, Chief Executive Officer>>

Sure. So, clearly, I can't speculate over why the FDA has not decided to have an AdCom or call an AdCom in this particular case. As I think mentioned in the past, I think, the FDA tends to have an AdCom whenever they feel that they don't have all the adequate internal expertise, so they can get significant benefits from external advice and for either approval reasons or labeling reasons, or looking at certain subpopulations and so forth. I typically think of theAdCom, it's just part of the process of the FDA approval. I don't see it as a negative or a positive in any way. And of course, given the chance of an AdCom, we have to prepare for one and – but that's really water under the bridge.

So at this stage, I think what I can say is basically we have to rely on the data that we've shared and I feel that the data that we shared, I think is very compelling when it comes to roxadustat and the ability to basically show yes, improving, correcting and maintaining hemoglobin levels, but importantly, as a result, decreasing the number of transfusions and then the broad safety data that we have first in NDD, where we look at both our safety data there when we compared to ESAs. As you know, we have had pretty compelling data when it comes to incident dialysis we had stat sig in terms of a reduction in the number of MACE events in that setting.

And then when we look at NDD, we were compared to placebo and we basically look at comparability when it comes to overall safety. So, we feel very good about the overall package that we had. We had an incredible presence at ASN, and maybe we can talk a little bit about that, but we had 42 abstracts between us, together with our partners, AstraZeneca and Astellas at ASN, so 42 presentations in total. And we had out of the 100 most viewed posters, 20 were roxa posters and the top two. So, I think that tells you a bit about, I think, the interest by the community, but also are pretty broad scientific presence in that same.

<< Annabel Samimy, Analyst, Stifel>>

Yes, that's great color. Thank you. So, everyone now is just waiting for labels and warnings and approval. So just before I start getting into some of the nuances there, there have been several delays related to FDA inspections recently because of travel restrictions and COVID. Are you aware of any at this point? Do you have specific manufacturing inspections that have to be conducted, have been conducted or have not been conducted? Can you give us any comfort around that?

<< Enrique Conterno, Chief Executive Officer>>

Yes, I don't know if I can give you a lot of comfort in terms of giving you the color, but I can provide some context. Keep in mind that the given – that we had shared that we're not providing color on our interactions with the FDA at this stage and their labeling or manufacturing or anything like that till basically the action date. I think the context that we'll provide when it comes to manufacturing in particular, clearly the FDA has issued guidelines when it comes to manufacturing inspection during this COVID time and how they're thinking about that and the use of virtual inspections.

But clearly, I think the context that I will provide is a context of the difference between large molecules or complex biologics and small molecules. So it's a pretty big difference from a manufacturing perspective. And then also what is the track record, right, of the manufacturing sites when it comes to FDA and passing inspections and so forth. I think all of those things will play a role in how the FDA thinks about that. I think what I can share is that we feel very good about our partners that are conducting the manufacturing and about the overall submission that we've made to the FDA. So we continue to feel very confident.

<< Annabel Samimy, Analyst, Stifel>>

Okay, great. And maybe then – since, again, you're not talking about labeling and specifics there. Maybe what you could do is, I guess, give us the range – you'd given us the range actually before, are there no black box warning to black box warning and a whole range in between. But maybe you can help us to understand the impact of what you think are sort of like the extremes in the middle in terms of how that might affect your commercial opportunity.

<< Enrique Conterno, Chief Executive Officer>>

Yes. So – you're right. We've provided that those bookends. So, on one side no box warning, on the other end basically a box warning that looks like an ESA box warning. And there are a number of things in between, including, of course, with the languaging of, if there were to be a box warning, what it says as one of those in between scenarios. The way that I think about this is in two fronts. Clearly in the dialysis setting, I think what we have to always remember, those patients are already being treated for anemia for the most part. So at the end, I think, there's a choice between using what they're using today and basically a new treatment option in the case of roxadustat and what does that treatment option really offers. But the option that they're using today actually has a box warning.

So in that setting I feel that is going to be the totality of our data that basically will matter. And quite frankly I think the discussions that we have with the dialysis organizations, because in many cases, those protocol decisions are being made centrally as we – as they think about treating patients within each of the respective sites. So my sense in that case from a commercial perspective, it's really how do we fair relative to ESAs when it comes to the label itself and what advantages do we offer keep in mind that we actually – in our trial we actually showed a statistically significant higher levels of hemoglobin with our product relative to ESAs and, as I shared, a number of other benefits, but also less transfusions when we looked at pooled analysis. And finally the incident dialysis data, we think is very important when those patient's initiate dialysis. So, clearly, we have important data.

When it comes to NDD, I do think that the case that we have to make, I think, is a little bit different because in this particular case, patients are not being treated. We estimate that less than 10% of patients get treated in this setting. In fact, when you look at the last 12 months prior to dialysis, only about 14% of patients have actually received the ESA as a treatment. So the opportunity here is to significantly scale the number of patients that are actually being treated in this setting. And the opportunity is very significant. It's a very significant opportunity that will develop over time, but in a way we're building a market, so we need to increase treatment rates.

To that end, I think, it is not enough for us to think about how do we compare to ESAs, but in this particular case, the label tends to matter, in my view, more than in the dialysis setting, because we need to make that case to patients and to physicians. I feel very good about our opportunity with the data that we have to be able to build a considerable – to be able to realize the considerable opportunity that I see in that particular setting.

<< Annabel Samimy, Analyst, Stifel>>

Okay, great. And so maybe we can talk a little bit about the experience in China then because I guess the question is whether you can look at the experience there and apply it to the U.S. Clearly, there are differences between the markets, the reimbursement is different, but maybe, what about the treatment approaches to anemia and the patient type? What kind of parallels can we draw between what's happening in China versus what you think you can do here in terms of the launch?

<< Enrique Conterno, Chief Executive Officer>>

Yes, I think, it's fair to say, and I don't use this word too often, but I would say that our China launch right now I'll qualify it as exceptional when we look at what the product has achieved so far. Keep in mind that three quarters, post reimbursement, Q3 we had nearly \$23 million in net sales for the product after \$5 million in Q1 and \$15 million plus in Q2, so very significant important ramp up quarter-on-quarter. Importantly, I think, we have achieved significant listings in hospitals. Today when you look at our overall listing, we are now listed in hospital that basically represent us as of the end of Q3, 55% of the overall China market that used to take products years to be able to achieve that level of listing in China.

And I think to your question of what type of read-through can we see based on China to the U.S.? And clearly, the reimbursement is different. We have now national reimbursement in China. We're listed in 55% of the market. In the U.S., we will need to work through the TDAPA and then formularies in the NDD setting. But when I think about China in particular, what we learn is the physician adoption that we've seen in the hospital, that we are listed in is very significant, which is driving that demand and that revenue that I just spoke of.

And importantly, we see basically utilization across a number of different settings, which is very important that people see the benefit of the product, not just in one particular setting that which would be unlimiting for future growth, but basically we are growing and we are penetrating a number of different settings. About one third of our sales were NDD in China or our patients about two thirds were basically in the DD

setting. That's expected the DD uptake would be quicker, but we expect the NDD opportunity actually to be larger over time as we develop that in China as well. And then with NDD, basically different types of patients, we see peritoneal dialysis patients. We see the typical patients in the dialysis centers. So, we basically see opportunity to grow in a number of different ways, many different levers for us to grow, many different opportunities for us to grow longer-term, which I think is excellent.

<< Annabel Samimy, Analyst, Stifel>>

Okay. And then if you can, maybe qualify the usage in the NDD in China a little bit. In terms of the real-world practice, what are they finding in those patients? Are physicians gaining comfort around the safety? Are they seeing some of the clinical benefits of the anemia control? Are they getting ancillary benefits? Have you been able to draw any of that kind of data from the Chinese population?

<< Enrique Conterno, Chief Executive Officer>>

Yes, I think, what we have right now is a lot of what I'm going to call the feedback from physician, but it's more anecdotal than formal feedback. I think we need to wait a little bit to get a better data on – okay, at the end of the day how are patients faring and what are the treatment patterns, what is the overall adherence that we're basically seeing. So we need to see a little more longitudinal data to be able to comment more on that. Clearly, the feedback is very positive.

And that's one of the reasons why we see basically some of the uptake when it comes to demand and so forth across the different patient populations, but we need to wait a little bit more to look at that. Some of the feedback that we basically see is not unexpected, right. Clearly, physicians that are using the product are quite familiar with the data, not just the China data on the label, but the overall data, and what's presented in different scientific forums. But importantly, I think, clearly the ease of use of the product is something that they comment quite a bit on.

And of course, that's expected. That's not how I would hang my hat on, I would want to make sure that at the end, people are looking at all of the better outcomes that we can develop, right? The fact that people have better hemoglobin control and therefore they can reduce the risk of transfusions. And we hear that, we hear how quickly people can correct their hemoglobin and the efficacy of the product. So we have — we do a lot of market research and that's something that really stands out, which is we just have an excellent benefit risk profile that the product offers.

<< Annabel Samimy, Analyst, Stifel>>

Okay. And you don't know at this point how long on average patients are able to stay on treatment?

<< Enrique Conterno, Chief Executive Officer>>

We do have some initial data, but I think, it's important that we wait a little bit long. It's still relatively early, I think, in the life cycle to be able to look at that. And so it is likely we will comment on that at the start of the New Year.

<< Annabel Samimy, Analyst, Stifel>>

Okay. All right. Great. And then anything that would be done differently in the U.S. market – outside of like the reimbursement landscape being very different, anything that you would – that you learned from the Chinese launch, that AstraZeneca learned from the Chinese launch to bring over to the U.S. to make it more effective or optimize it in any way?

<< Enrique Conterno, Chief Executive Officer>>

Well a few things, but clearly, I think, one of the surprises in China is how quickly we've been able to realize or start to realize the opportunity will be in NDD. We thought that would take longer. So I think that's a great aspect for us to think about. And that opportunity is very important and we – let's make sure that we go after that opportunity, not just thinking about the long-term, but also what is that we could build with that opportunity quickly.

As you know, it is – given the data that we have ahead of our competitors, it is likely that we – yes, we have to build this market, but we're also going to be there as the sole – likely the sole HIF PHI for a number of years. Andit's an incredible opportunity that I want to make sure that we maximize.

<< Annabel Samimy, Analyst, Stifel>>

Okay. All right, great. So why don't we talk about the uptake in the DD market, obviously that can go relatively quickly, not only because you are offering a better alternative to ESAs. But also because you've got a concentration of the customer base. So you're negotiating probably at a corporate level with – in a negotiation with two players, essentially you can get 68%, 70%, 80% of the market, frankly. So just help us with the logistics there and what can we think of a ramp-up realizing very well that you need the TDAPA payments, could you realize sales before you actually get that TDAPA payment or is it just, first quarter is a wash and then we should just assume sales after that?

<< Enrique Conterno, Chief Executive Officer>>

Yes, I think I have to start there with basically the overall clinical profile of the product and what it could offer the dialysis organization. So we feel very good about our data. Keep in mind that we worked with those dialysis organizations in our Phase 3 trial. So they are already knowledgeable to a certain degree of the product. But also we are conducting with dialysis organizations 3b studies now as we speak.

And then as you will point out, typically they basically implement certain standards and protocols in the dialysis settings. So those discussions tend to happen at the corporate level. And AstraZeneca is the one leading some of those discussions with the dialysis organizations. And clearly it is about the clinical profile, it is what roxa can add. And there's no question those discussions are important.

And of course TDAPA plays a critically important role because TDAPA allows basically for the product to be added into those settings without being included to the bundle, which would make it significantly more difficult. We expect that roxadustat will be eligible for the TDAPA, and we've shared that we expect that inclusion will happen as early as basically April 1 of next year, the inclusion of TDAPA. TDAPA is a huge catalyst, I think, for the product. And you are right, I think, with the inclusion of TDAPA, I think, what we expect is that uptake and utilization can be very fast.

<< Annabel Samimy, Analyst, Stifel>>

So is there anything – so I think if I remember correctly, CMS, said that all NCE starting January 1 of 2020 would get automatic TDAPA payment. I imagine that roxadustat is an NCE, so does it fall into that category automatically, or do you have to still apply for it and wait for it?

<< Enrique Conterno, Chief Executive Officer>>

Now, you still have to apply and you still have to wait. So you basically make an application for TDAPA. You need to get a code as well, but only now you basically that submission to CMS. CMS needs to review that, and then your eligibility basically happens – should happen basically at the start of the next quarter, right? In this particular case, given our approval is – our PDUFA date is December 20, we basically believe that it is reasonable for us to think about that we could get – we will get that and we could get that would be April 1. So part of the discussion that we had with CMS, we have – we believe that roxadustat will be eligible.

<< Annabel Samimy, Analyst, Stifel>>

Okay. Now, going back to your other comment with regard to some piloting that the dialysis providers are conducting right now, they've obviously worked within clinical programs with roxadustat. What are they going to be learning from the piloting of this product to gain additional experience, to get them comfortable? Are there certain metrics that they're looking for? Is it economic metrics? Is it healthcare outcome measures? What are they looking to learn from this piloting?

<< Enrique Conterno, Chief Executive Officer>>

Yes. Keep in mind; whenever we conduct the Phase 3 trials, we are looking at the product from the perspective of evaluating the efficacy and the safety of the product from that perspective of FibroGen. Clearly, we've already said and have demonstrated both the efficacy and the safety of the product. So, when it comes to the Phase 3 studies we are now working within each of the dialysis organizations to better assess basically this product within those specific settings, right.

So, we're working with them to basically structure these studies to make sure that the data that we get from these studies is meaningful, not just in a broad sense to roxadustat, but meaningful to the specific dialysis organizations.

So, I'm not at liberty to disclose everything that we're looking at, but we've, of course, worked very closely with them to ensure that these trials meet their needs. And it's a

great opportunity you call it a pilot and it's really a Phase 3b study, but clearly in a certain way, it's a way for them to think about also, okay, how does roxadustat work within those settings and get the advanced learning from that?

<< Annabel Samimy, Analyst, Stifel>>

Okay. Will they be releasing that data at any point?

<< Enrique Conterno, Chief Executive Officer>>

Well, I think, the expectation is yes. We expected to conclude those trials early – in the first half of next year. And at some point in time, we will intend to disclose all of that data as well.

<< Annabel Samimy, Analyst, Stifel>>

Okay. Then if we can move to NDD for a moment, what kind of conversations have you had with payors ahead of approval? And how long do you expect it to take to get these – the drug incorporated into the various plans? Is it your standard six-month wait until everyone sort of gets on-board with it, or do you think this is a drug that's in pretty meaningful demand for this population given there's really nothing adequate for them with the assay ESA?

<< Enrique Conterno, Chief Executive Officer>>

Yes, I think the aim is to ensure that patients can have access to the product as soon as possible, all right. To achieve that there are a number of things that that we need to look at. But let's keep in mind, it is AstraZeneca really that is conducting those negotiations with the payors. Clearly, I think the key is going to be to ensure that we have the discussions with the payors to ensure that we can include this product in the formularies as soon as possible. And even if it's not included immediately in the formularies, ensure that there's no exclusion for the utilization of this product, but it can still be used.

So we are in the process of working with all these organizations. As you know, I think, if we were to go back maybe eight to ten years, formulary [indiscernible] (0:27:19) used to happen once a year, now they happen much more frequently. There are meaningful updates in commercial formularies and other types of formularies every quarter. So we want to take advantage of that, and I think, that's something that we look forward to executing.

Typically, when it comes to Part D, Part D tends to basically – the formularies are set in advance and they typically happen once a year. And the submission to CMS actually happens pretty early. So, the submission for 2021 already happened in May, right. So in May we'll do our submission for 2022. But that doesn't mean that the product cannot be covered. There are a number of things that we are working on to try to think about how can we ensure that at the end of the day the patients can have access to this product.

<< Annabel Samimy, Analyst, Stifel>>

Okay. And what part of the market is Medicare Medicaid? In terms of the NDD population, I know a lot of it is commercial, but what percent of that...

<< Enrique Conterno, Chief Executive Officer>>

When we think about NDD north of 50% will be Medicare, commercial maybe a little bit over 30%, Medicaid maybe about 10%. I don't have the numbers in front of me, but those seem like the right numbers.

<< Annabel Samimy, Analyst, Stifel>>

Okay. All right. Great. And maybe you can just talk about the market opportunity in terms of, initially going after first in patients who had been treated before who've dropped ESAs and now would be eligible to be treated again. That's the low-hanging fruit sure, but there's clearly a portion of the market that still chronically anemic. So what part of that – what portion of that market is chronically anemic that should be treated?

<< Enrique Conterno, Chief Executive Officer>>

Yes, I think when we think about this market we shouldn't be thinking about what it is today, what the status quo is today, when we think about NDD, or really given what it was maybe six or 10 years ago when the market was significantly larger. We need to be thinking about establishing a new standard of care for anemia and patients within NDD.

The question is, how do we go about doing that? And clearly there is an element of the offering, so what does the product offers. Making sure that physicians feel comfortable with the product because of the – when we think about the physician community that are going to be largely treating many of these patients and the fact that in many cases some of these physicians would also have already experienced in the DD setting, my sense is that is going to inform, can be a pretty good catalyst and inform the NDD setting as well in the case of nephrologists.

So what I expect is for that education to be able to happen relatively fast. And then I think we need to make sure that patients are aware of this product and this alternative. So we will need to somehow find a way to activate patients, so they know that there's an alternative out there. And at the end, anybody that is basically suffering from anemia should be treated to make sure that they can realize the benefits of this product.

I think on your question, how large is this market? It is very significant. I think it's enough to say that while initially we see just like in China, DD maybe having more patients in DD. Over time, I believe, that the opportunity in the NDD setting actually dwarfs the opportunity in the DD setting. We look at the number of patients, longer term what this could mean for the number of patients being treated, benefiting as a result the revenues for roxadustat.

<< Annabel Samimy, Analyst, Stifel>>

Okay. We're going to do rapid-fire in the last moment. When do we expect data from the chemotherapy induced anemia? When do we expect data for MDS? And is there any additional data we should expect from Pamrevlumab in COVID?

<< Enrique Conterno, Chief Executive Officer>>

Yes. I think in the case of chemo-induced anemia, as you know, we have a Phase 2 trial that is ongoing. We should have data in the second half of – a readout in the second half of next year. And our intent will be to initiate the Phase 3 trial after that. In the case of MDS, it is a Phase 3 trial. We expect data in 2022, and that's what we've shared. So those are the two key trials when it comes to additional potential indication for roxadustat.

As you know, the chemo-induced anemia indication is very significant, given what we saw in the past with ESAs. So when you look at the number of patients that could benefit, it's very, very significant. And also the doses tend to be higher; at least the ESA doses for those patients were higher. So made that a very, very significant sizable opportunity. What was your last question?

<< Annabel Samimy, Analyst, Stifel>>

Any expectation around pamrevlumab in COVID or should we not be factoring that into our calculations at all at this point?

<< Enrique Conterno, Chief Executive Officer>>

Yes, those trials are ongoing. And given the search in COVID clearly those trials are enrolling better in particular, the trial in Italy and so forth. But clearly, I think, we view, I think, the COVID opportunities differently than we view the three indication that we have in Phase 3. So we have three indications in Phase 3 in IPF, DMD, and LAPC. Because those indications, each one of them, I think, is very significant on its own. And we have data already Phase 2 data. When it comes to COVID really, we have an intent, we have an aim, but this is the first data that we'll be generating in that space. And by the way, there's a lot of competition right now in COVID.

<< Annabel Samimy, Analyst, Stifel>>

Yes. Okay. Great. Well, we are out of time. And I was trying to get everything in there as much as I possibly could. But I think we've covered most of it. And I guess we'll have to do another one of these one day to get more questions in there.

<< Enrique Conterno, Chief Executive Officer>>

Very good. Thank you very much, Annabel.

<< Annabel Samimy, Analyst, Stifel>>

Thank you very much. And good luck with the rest of your meetings.

<< Enrique Conterno, Chief Executive Officer>>

Thank you.

Presentation

Michael Jonathan Yee

Jefferies LLC, Research Division

Hello, everyone, and welcome to another great session at the Jefferies Virtual Global Healthcare Conference in London. I am doing this fireside chat from London bridge is here behind me. And Enrique, my good friend at FibroGen, Chief Executive Officer, Enrique Conterno, is there at the headquarters in San Francisco, hard at work in bringing forward roxadustat.

I just wanted to turn it over to Enrique and maybe take a step back and ask you an important year, this year, of course, culminated with the potential PDUFA date and then even more important 2021 as you go out and try and execute on a commercial launch.

Question and Answer

Michael Jonathan Yee

Jefferies LLC, Research Division

So I wanted to start by asking you, what are you most focused on here, as we get into the end of the year, certainly, regulatory discussions is one of them. How are you thinking about the evolution of the regulatory discussions and the results, and how you're thinking about preparing for 2021?

Enrique A. Conterno

CEO & Director

Well, first, Michael, great to see you, and thank you very much for the invitation. This is no doubt a very exciting time for FibroGen with the PDUFA date coming up quickly. Now there's a lot of attention, of course, on roxadustat. But not just the regulatory process, but also the commercial preparations in the U.S. because we want to make sure that we can have an outstanding launch.

Now you asked about the broader priorities, but clearly, roxadustat is also being developed in 2 additional indications, MDS, in Phase III and CIA in Phase II. We expect beta for CIA in the second half of next year, likely maybe spilling into the first half. So that's also pretty exciting. And clearly, we have the China launch, which is, I would describe it as going extremely well.

Moving to our second important asset is pamrevlumab Phase III studies, very much focused on execution on this important indications of high unmet needs in IPF, DMD and LAPC.

So important work that we're doing, and we can have a discussion. And finally, I think something that we have not discussed a lot, but we are quite focused right now on reenergizing our research efforts. And I'm very excited about some of the progress that I see us, how we're thinking about it, as you know, we brought in a new Chief Scientific Officer, Percy Carter and excited that he's leading those efforts.

Michael Jonathan Yee

Jefferies LLC, Research Division

Fantastic. Well, I can't wait till you tease us with a new compound.

Enrique A. Conterno

CEO & Director

Yes, very good.

Michael Jonathan Yee

Jefferies LLC, Research Division

Very good. All right. Well, before we get to talk about that, we need to make sure you execute on roxadustat first. I don't want to get into the details specifically about the interactions. My question ultimately is, as you get here towards the end of the PDUFA, what -- or how will you help investors out, thinking about the 2 or 3 different scenarios.

One of those scenarios is approval with a clean, very, very, very clean broad label. One of those scenarios is approval, but maybe it looks a little more like an EPO label and one of them could be a delay. Things happen. It's COVID, I'm not sure. But talk about those different scenarios. And what are the implications of each one of those?

Enrique A. Conterno

CEO & Director

Yes. Clearly, we have a high level of conviction on the overall submission, the strength of our data, so what I'm going to focus on is basically thinking about really the bookends of maybe what the label

will look like. And on one hand, I think you have a label -- and I know there's a lot of focus on the box warning, but our label that doesn't have a box warning.

On the other hand, you have basically, on the other bookend, a label that has a box warning that looks like the EPO box warning. There are, of course, a number of scenarios in between. The wording of the box -- of a potential box warning would be important, including what populations are included in that box warning. So clearly, I'm unable to comment on our current interactions with the FDA, but I think the cadence is good. And we expect, quite frankly, approval by the -- or an action by the PDUFA date.

Michael Jonathan Yee

Jefferies LLC, Research Division

Can I -- that's really important. That's great. And I think that's helpful because actually, I've gotten a lot of investor questions about how it may not just be as simple as black box or no black box. Are you implying that if you go look at different classes, different black boxes, say different things, you could actually have comments in a black box only on a specific indication, but on a different indication because I've actually never really seen that. But help me out, now those -- all those are different things. So I need to -- if there is one. I need to read it and then look at that?

Enrique A. Conterno

CEO & Director

Yes. I think we need to wait, of course, for our particular scenario. I'm not implying that we will have that, but all of those are possibilities. Clearly, I think the -- when we look at our data, we continue to feel that the data basically offers a very favorable risk-benefit profile for patients across the continuum.

Now one comment on any details at this stage. But yes, I think key is going to be for us, for us to look at the entire label, if there is a box warning, and that needs to be put into the context.

And what is the rest of the label also say. So we of course, as you can imagine, we think about all scenarios from a planning perspective, and now we're prepared for all scenarios and prepared to execute.

Michael Jonathan Yee

Jefferies LLC, Research Division

Okay. So let me talk about, regardless of what the label says, we have to go about and launch. And can you remind us in the United States first, since this is the country we're talking about. Who takes the lead? Is it -- how does it work? What are your economics? What is your involvement in the things? First of all, talk about that first.

Enrique A. Conterno

CEO & Director

Sure. So clearly, we have a great partner in AstraZeneca that has taken the lead in the United States. FibroGen, I think contributes to the launch efforts in the U.S., with the things that we can do well, which is, of course, providing the rationale behind the science and medical affairs.

So for example, when it comes to publications and when it comes to running the Phase IIIb studies, right now, with the LDOs those are things that FibroGen has taken the lead on. So we are excited about our preparations.

As you mentioned, I think the economics for FibroGen, we do not -- outside of China, we are fully reimbursed for all of our expenses when it comes to commercial efforts and development efforts. So the economics for us is basically that we are getting a royalty in the low 20s in the U.S.

Michael Jonathan Yee

Jefferies LLC, Research Division

Yes. All right. So since they will have the commercial sales force. But importantly, how does it work for dialysis? And how does it work for nondialysis? In dialysis, we all know that there's 2 big major players

Fresenius, DaVita, if I can believe Fresenius was at our conference. They didn't say anything yet because I don't think it's anything to say yet. But -- and then there's a smaller mom-and-pop type dialysis.

Do you need to get contracts at those centers? Are they studying your drug right now as we speak in a study? Would they be ready to go? And could you get contracts pretty quickly? How does that work in the dialysis?

Enrique A. Conterno

CEO & Director

Yes. Clearly, we have 2 very different segments in dialysis, nondialysis, not just the patients, but clearly who we are contracting with are different players, right?

As you mentioned, when it comes to dialysis, of course, it's the dialysis organizations. And this segment is highly concentrated. For us, I think one of the key catalysts for the broad use of roxadustat is going to be basically getting reimbursement. And that applies to both dialysis and nondialysis.

In the dialysis setting, that catalyst is driven by the event of having TDAPA eligibility, if the roxadustat is eligible for TDAPA and we're going to make efforts to try to submit as soon as we get approval to be able to ask CMS, make the submission and ask for that inclusion of roxadustat into TDAPA.

In terms of timing, the way we think about it is, we believe that it is possible, but it's also the earliest date that we could get TDAPA affective for roxa would be April 1 of 2021. I think that's a reasonable date, but it's also the earliest date because the effective date for TDAPA is typically at the start of each quarter.

And when it comes to the discussions with LDOs, clearly, we've worked with the large dialysis organization for quite some time. They were part of our Phase III trials. They are conducting Phase IIIb studies as we speak. Basically trying to -- clearly, the roxadustat's efficacy and safety is well documented now. But now they're starting it within their setting, which I think is going to be very helpful.

And now clearly, there are discussions, right, when it comes to thinking about the preparation for roxa to come into the market and which includes, of course, also contracting. AstraZeneca really takes the lead on those contracting discussions. FibroGen takes the lead on the discussion when it comes to the Phase IIIb studies. And clearly, we have excellent relationships with the large dialysis organization.

Michael Jonathan Yee

Jefferies LLC, Research Division

Okay. So you have excellent relationships. They're testing the drug out in their own setting. Now there's trial programs going on. They're studying it to see how it impacts their flow. And they're aware of it. I think there's confusion or head scratching going on because people know that, for example, DaVita has a contract, supply contract, publicly with Amgen, and Fresenius is a large Mircera user. But you feel comfortable that there will be not 100% market share, but say, but there would be deals that can be in place so that you will see revenues there.

Enrique A. Conterno

CEO & Director

Yes. I base my confidence on the strength of that data, right? So if we think about roxadustat, there -if we just take -- look at the number of patients on dialysis, we have to start that there are a number of
those patients in dialysis. Most of them are treated for anemia, but we have about 15%, 20% of those
patients that are hyporesponsive, right? So where ESAs are really not working very well. Roxadustat
-- and they are in very high doses. roxadustat will be an excellent option there, okay? What about the
incident dialysis population, where we basically showed a very significant benefit when it comes to MACE
and MACE+.

So when we think about those, we believe that roxadustat, this is not a -- has -- is a very important option, I think, for the...

Michael Jonathan Yee

Jefferies LLC, Research Division

There's 2 populations there that logically makes sense. And the strength of the data alone, which is hyporesponders, which, by the way, we confirm with our own doctor checks that those guys are loss-making for the LDOs, by the way, right? You agree with that. They're loss-making.

Enrique A. Conterno

CEO & Director

Yes. That's right because there are very high doses. The payment is capitated.

Michael Jonathan Yee

Jefferies LLC, Research Division

Yes, they're losing money on the bundle. And second of all, incident dialysis where there's strong cardiovascular data.

Enrique A. Conterno

CEO & Director

That's right. So this is just to say that we need to create a situation that is going to be a win-win for both the dialysis organization and of course, for the right patients to use roxadustat.

Michael Jonathan Yee

Jefferies LLC, Research Division

How confident are you that it will get it to TDAPA? I mean is that like that's straightforward like getting fast track or priority review? Or like, is there like a whole bunch of stuff that could happen and that's why, I don't think that's actually a huge breakthrough. Like what do we -- how do you explain that to somebody?

Enrique A. Conterno

CEO & Director

Yes, there's a very clear process how to apply for TDAPA, and we had the discussions with CMS. We think that we're going to be eligible. Of course, there's not a lot of presence for drugs that have gone through this process, which is different, maybe from a breakthrough designations or something like that. But we feel that the process is pretty clear. We think it's straightforward.

Michael Jonathan Yee

Jefferies LLC, Research Division

Okay. I'm going to go read the documents online and figure this out. Okay. And how is it reimbursed? Like how does that workflow happen? So in the dialysis center, Sally comes in, she's at Fresenius, she used to get treated for the anemia, does the script and the prescription all get done there? Or does she get it at Walgreens? And how does all that work?

Enrique A. Conterno

CEO & Director

Clearly, when it comes to the dialysis organization, you basically have a highly integrated system, right, with important protocols and so forth. The -- one of the things that is important to understand, when we think about TDAPA, first of all, you basically have a system, there is a bundle. And keep in mind that the patient actually has a copay for that bundle of about 20%. TDAPA represents an additional payment, right, to the dialysis organization for the use, in this case, of roxadustat.

The patient will also have a copay on TDAPA of 20%.

Michael Jonathan Yee

Jefferies LLC, Research Division

So I know the bundle is about \$250 per treatment. If they want to get roxa, the dialysis company will purchase the bottle. And they will get reimbursed for that bottle using TDAPA.

Enrique A. Conterno

CEO & Director

That is correct. The reimbursement is basically 100% of the ASP price, at the average selling price. And when this is dispensed to the patient, the patient is responsible for 20% of that.

Michael Jonathan Yee

Jefferies LLC, Research Division

Makes sense. Okay, great. So that's helpful because, again, we're not -- nobody on Wall Street is particularly used to how that works. We're used to getting drugs either at the hospital into Medicare Part B or it's a Medicare Part D, which is at the pharmacy level. So -- okay, that's great.

Now how about nondialysis? How is that going to work? How does reimbursement work there? That's not to doubt, all right? Is that different situation. It's COVID, right? You have a nephrologist who's taking care of you. Maybe you just forget the script at the pharmacy. How is that different?

Enrique A. Conterno

CEO & Director

Yes, that is different because those patients basically will be getting their prescriptions, like you said, at the pharmacy, and you have very -- 3 different segments. I expect that in the case of roxadustat, about a little bit of north of 50%, it will be basically Medicare. So Part D, about 30% Commercial and then the rest Medicaid.

Michael Jonathan Yee

Jefferies LLC, Research Division

Medicaid, yes.

Enrique A. Conterno

CEO & Director

So those patients, yes, they will see their nephrologist. Keep in mind that those nephrologists also are basically part of treating patients with dialysis as well, right? So they have different types of patients, patients that are dialysis dependent and patients that are nondialysis dependent. So the experience on one setting, it's going to complement the other, right?

So it's -- and this particular case was going to be important, like I said, reimbursement is key. So we need to make sure that we are -- patients are going to have access. There are many ways that patients can have access, but longer term, clearly, formulary, having a formulary placement, I think, is key.

Clearly, Part D works differently from commercial and Medicaid, but I feel that we have a great partner that is going -- has been focusing on thinking about this and try to ensure that patients do have access and that we have the right formulary placement as soon as possible and the position as well for the patient.

Michael Jonathan Yee

Jefferies LLC, Research Division

Why -- I asked on this, the dynamic is different. Because it's not a bundled stuff, stuff like that. This is up straight for Medicare Part D. It should be no different than a cancer drug like Revlimid, you take at the pharmacy, you take it home. You pay your copay. And if it's commercial, you should be covered and there's a copay. That's just a formulary thing. You got to work to get the formulary contracts.

What I worry about is a COVID environment where patients may or may not be coming in as much if they're not on dialysis, right? How often do they see their doctors? Is there an urgency to get them on as quickly as in, or there's probably not going to be swapping, so it's more just -- maybe just talk a little

bit about that and if there is -- is there less reason to have a black box there or more? Maybe is this somewhat challenging than dialysis?

Enrique A. Conterno

CEO & Director

Yes. I think it's a good question for us to think about COVID. I think we have a few things that are working in our favor. So I'm going to call them important tailwinds, when it comes -- keep in mind that, number one, that AstraZeneca has a renal presence already, okay?

And that renal presence -- so they already have a sales force. They have presence, including the renal presence, with a presence in the dialysis organization.

So that is hugely important because keep in mind of those relationships exist with the customers, right? That's very different from trying to have a new sales force, establish new relationships during COVID time. So...

Michael Jonathan Yee

Jefferies LLC, Research Division

They're very good, and that's why you did that partnership. I have too many small biotechs that are struggling right now during cover. Yes. So yes, that is AstraZeneca that will be doing that. Okay. That's number one.

Enrique A. Conterno

CEO & Director

Correct. So now clearly, one of the things that we need to -- when it comes to patients in the NDD setting, we need to create an urgency for treating anemia because today, this is very much undertreated. I know people ask me, well, are we going to convert patients from ESAs and so forth. Keep in mind that the number of patients that are being treated is a very -- it's really in single digits, when it comes to the overall potential addressable market. So for us...

Michael Jonathan Yee

Jefferies LLC, Research Division

This is not \$1 billion, though. Just -- dollar-wise, it's about \$1 billion. I think it's about \$1 billion it checked my market model. But the number of patients is small relative to the size, but it is doing about \$1 billion.

Enrique A. Conterno

CEO & Director

Yes, it is still significant. But think about what the potential market is. And I -- you asked about how to create that urgency. Clearly, one of the things that we've shown with our data is a very significant decrease in transfusions -- blood transfusions.

This is extremely important for patients. You talk to a patient, and you ask, clearly, avoiding that is very important. And we didn't have just a small decrease. We basically -- when we look at time to transfusion, we basically -- the hazard ratio was 0.26 very, very significant benefit.

In addition, you asked me about this as well. But as you know, we basically, recently shared some data around roxadustat and how you basically see different levels of hemoglobin achievement and correlating that to making it.

Michael Jonathan Yee

Jefferies LLC, Research Division

Yes.

Enrique A. Conterno

CEO & Director

And what we saw was basically that for low levels of hemoglobin, below 8 and even below 10, you basically see a much higher mass events and you really -- as you correct and maintain that, you start seeing a much lower level of events.

So that's another, I think, important aspect because I think the importance of the data is, it's important to treat anemia. You are basically trying to reduce blood transfusions and so forth, but it is pretty clear when the hemoglobin is way too low, people are going to be at much higher risk of mass events.

Michael Jonathan Yee

Jefferies LLC, Research Division

Do you think you'll see some swapping? Is that the lower hanging fruit? Or do you think it's new patients coming on to you -- didn't want EPO? Maybe talk about that. If you had it, yes, a year or 12 months from now.

Enrique A. Conterno

CEO & Director

I think in the NDD setting, you will see some swapping just because roxadustat is going to be -- all of the benefits, but it's also so much more convenient for patients.

Michael Jonathan Yee

Jefferies LLC, Research Division

Right, yes.

Enrique A. Conterno

CEO & Director

But honestly, I don't see that as the long-term reason where we should feel confident about what we could achieve. I think what we need to look at is not just are we converting those patients. But how we're raising the treatment rates because at the end, that's really the long-term opportunity that we see.

Keep in mind that when we think about those segments, DD and NDD, we always say that DD should be up to a faster uptick, a lot of control from protocol perspective, from dialysis organizations, that they can basically roll out.

But when it comes to NDD, while the uptick might be slower, so we expect more than 50% of our revenues initially to come from DD. Longer term, I view NDD as larger, including, I would say, much larger than DD, but we need to do the work to basically build that market.

Michael Jonathan Yee

Jefferies LLC, Research Division

Okay. Well, this is why people are positive in the long term, but they also -- you know how Wall Street works, the first 3 or 4 quarters where people get a look at what you're telling me. Are you telling me it's big Enrique, why are the sales not big? So that's the test that people put you up in the first few quarters.

Enrique A. Conterno

CEO & Director

Well, we got a -- there's no future without the present. So you got to deliver in the near-term and in the long term.

Michael Jonathan Yee

Jefferies LLC, Research Division

One other question, too, that I think is important in nondialysis and dialysis is what you can get in the label. Can you get secondary endpoint things like incident dialysis, cardiovascular benefit? Can you get time to transfusion? I look at a lot of labels. I rarely see secondary endpoints in there.

Enrique A. Conterno

CEO & Director

Yes. So clearly, this is part of the discussion with the FDA, I think, from FibroGen's perspective, the more of our clinical data that we can include in the label, that's positive for us, right? So -- but I won't be able to comment beyond that until we basically have the label.

Michael Jonathan Yee

Jefferies LLC, Research Division

All right. I just -- I really see much secondary endpoints. That's also -- I'm hopeful, but I don't know. Okay.

So one last step because you did mention at the beginning of this. I think it's important, let's say, a 12 and 18-month view that MDS could be a pretty large opportunity. Now frame it for people because the Phase III is going on in MDS. I thought that the data is in '21, but I think it's '22, but correct me if I'm wrong.

And is it literally, do I need to track luspatercept sales from Acceleron like -- or is that actually under representing what you could do because they're only, I believe, in are as positive patients. So are you telling me your drug could basically be used in front of -- instead of luspatercept, they're doing \$800 million a year, annualized?

Enrique A. Conterno

CEO & Director

Yes. I -- so clearly, that speaks, I think, the need in this particular setting for these patients. We expect to have the readout in the first half of 2022, that's -- we think that's an important opportunity. Clearly, this is an important Phase III study, is the next indication for roxa. You're right, we are basically studying patients irrespective of sideroblast status.

So we will be basically looking at all of those low-risk MDS patients. When we think about luspa, they are basically doing well, but they do have -- they're going after a much smaller segment. That might be, maybe 30%, 40% of the overall opportunity that we will go after.

Now there's a pretty big difference between them and us, and that is, we're going to be bound by some of our pricing that we have in CKD, right? So the price level is going to be guite different.

Michael Jonathan Yee

Jefferies LLC, Research Division

Now, how different is that? That's important. Thank you for clarifying that.

Enrique A. Conterno

CEO & Director

Yes, it is pretty significant. I don't recall the exact price of luspa, but it might be in the 150,000 plus per year, right? So now we still believe this is an important opportunity, relative to CKD is much smaller. The opportunity that is more comparable to CKD is the opportunity in CIA, chemo-induced anemia, a very significant opportunity. We expect data, as I mentioned, in the second half of -- for our Phase II of next year, potentially spilling into the first half.

So we're excited about that data. We will assume that is positive, we will start a Phase III trial immediately.

But that opportunity, I think of it from a size perspective is almost as large as CKD.

Michael Jonathan Yee

Jefferies LLC, Research Division

Yes. I need to think about that a bit because I think Amgen got in trouble because they were actually running survival studies. I mean, is it still -- is EPO used at all in CIA or no?

Enrique A. Conterno

CEO & Director

Very little. Clearly, so that the use in CIA for ESA is used to be very significant. At some point in time, it might have been a \$4 billion market. That use today is significantly below that.

Michael Jonathan Yee

Jefferies LLC, Research Division

Right. So just to be clear, because you use chemotherapy, which is still billions of dollars, everyone of those people get anemia, they were giving EPO to treat that. Not because of any kidney problems because of the chemo, and people were doing that. When they ran the survival studies and showed as a negative impact on survival in cancer, people thought, well, why would I be giving this drug to cancer patients to treat the chemotherapy-induced anemia, could be actually feeding more oxygen to the tumor. So isn't that a problem? Just to be clear.

Enrique A. Conterno

CEO & Director

Clearly, we need to run the studies. But as you know, our roxadustat has a very different mechanism than EPO. So we think it's a much more natural way for the body to basically respond, right?

So we are excited, we're conducting the Phase II. We'll look at the Phase II data, of course, and we'll decide based on the data. But it is pretty clear that investigators are extremely interested or at least this is the case.

Michael Jonathan Yee

Jefferies LLC, Research Division

Fantastic. Well, so I want to ask one last question, and we'll save pamrevlumab for a different discussion because, obviously, we have a lot of roxa stuff coming up. But we have a PDUFA date at the end of the year. So we're just waiting on an announcement for that. And then whenever you get something, you'll let us know?

Enrique A. Conterno

CEO & Director

Absolutely. We're very excited. As I mentioned, we are -- FibroGen has been working on roxadustat for quite some time. So this is an incredibly important milestone for the company. We just need to make sure that we do our part to be prepared for a very successful launch. So that as many patients can benefit.

Michael Jonathan Yee

Jefferies LLC, Research Division

Who handles the NDA, who is -- is that Astra that's handling, or that's you handling the NDA. Who actually is handling the paperwork?

Enrique A. Conterno

CEO & Director

It is FibroGen. So FibroGen is the sponsor of the NDA. Eventually, that will go to AstraZeneca post approval.

Michael Jonathan Yee

Jefferies LLC, Research Division

Okay. All right. Well, I look forward to it. I'll be checking my e-mail every day between now and December 20, and wishing you good luck.

So thank you, Enrique, for being here with us. Good luck, and in the end of the year we'll be here with you, and thank you for being here with us.

Enrique A. Conterno

CEO & Director

Thank you very much, Michael. I appreciate the invitation.

Michael Jonathan Yee

Jefferies LLC, Research Division Thanks, Enrique.

FibroGen Announces Retirement of K. Peony Yu, M.D., and Appointment of Mark Eisner, M.D., M.P.H. as Chief Medical Officer

SAN FRANCISCO, Dec. 01, 2020 (GLOBE NEWSWIRE) -- FibroGen, Inc. (NASDAQ: FGEN) today announced the retirement of K. Peony Yu, M.D., Chief Medical Officer, and appointment of Mark Eisner, M.D., M.P.H. in that role. Dr. Yu will continue as Chief Medical Officer through December 20, 2020, the roxadustat PDUFA date, and will remain with FibroGen through March 15, 2021 serving as Executive Advisor to the CEO to support the transition.

Dr. Yu joined FibroGen in 2008 and has provided key leadership for global clinical development across the company, leading the development of roxadustat in multiple indications and advancement of the overall portfolio.

"On behalf of the board, shareholders, and our employees, I want to thank Peony for her tremendous contributions as Chief Medical Officer of FibroGen," said Enrique Conterno, Chief Executive Officer, FibroGen. "With her considerable expertise and leadership, roxadustat was approved in China and Japan for the treatment of CKD anemia with pending regulatory decisions in the US, EU, and additional countries, to potentially serve millions of patients worldwide."

"It has been my privilege to work with many talented colleagues at FibroGen to make a difference in the lives of many," said Dr. Yu. "I look forward to our upcoming roxadustat U.S. PDUFA date, and expect FibroGen will continue to advance important new medicines."

Mark Eisner, M.D., M.P.H. has joined FibroGen as of today, and will become Chief Medical Officer effective December 21, 2020, overseeing all global clinical development and regulatory affairs for FibroGen. Dr. Eisner has nearly 30 years of academic, biopharmaceutical, and drug development experience, from early clinical phase through post-commercialization.

"Mark's extensive leadership, clinical development, and regulatory expertise come at a critical time for the company as we accelerate our development and look ahead to multiple significant clinical milestones. The depth and breadth of his therapeutic development experience is an ideal fit, and we are thrilled to welcome him to the FibroGen team," said Enrique Conterno, Chief Executive Officer, FibroGen. "We look forward to Mark's contributions as a proven business leader, clinician, and researcher in our continued evolution toward becoming a commercial-stage biopharmaceutical company with a maturing clinical pipeline."

"I am excited to lead the clinical development organization during this important time at FibroGen, when the company is rapidly advancing its robust late-stage pipeline," said Dr. Eisner. "I look forward to progressing the current clinical studies to bring valuable medicines to patients."

Dr. Eisner, who brings more than 10 years of experience in clinical drug development and 20 years as a practicing physician, has held leadership positions in academic medicine, clinical research, and pharmaceutical development. In 2010, he joined Genentech, a member of the Roche Group, and was most recently Senior Vice President and Global Head of Product Development Immunology, Infectious Disease, and Ophthalmology where he led clinical development for areas including respiratory medicine, rheumatology, nephrology, inflammatory bowel disease, virology, and retinal disease.

Prior to Genentech, Mark was Professor of Medicine and Anesthesia at the University of California San Francisco where he was an internationally recognized expert on clinical research in acute and chronic lung disease. He served as a steering committee member and ultimately UCSF Principal Investigator for the National Heart, Lung, and Blood Institute ARDS Clinical Trials Network which conducted several clinical landmark trials. Mark also built a world-class NIH-funded clinical research program focusing on the epidemiology and long-term health outcomes of obstructive lung disease.

He was also an investigator in the UCSF Cardiovascular Research Institute. Mark published ~200 peer-reviewed articles, served on multiple NIH study sections, and was a member of the American Thoracic Society Board of Directors.

Mark graduated from Stanford University with an A.B. degree in Human Biology and then received his M.D. degree from the University of Pennsylvania School of Medicine. He completed residency training in internal medicine, served as Chief Medical Resident, and pursued advanced fellowship training in pulmonary and critical care medicine at the University of California, San Francisco. He also received a M.P.H. degree from the University of California, Berkeley School of Public Health.

About FibroGen

FibroGen, Inc. is a biopharmaceutical company committed to discovering, developing and commercializing a pipeline of first-in-class therapeutics. The company applies its pioneering expertise in hypoxia-inducible factor (HIF) and connective tissue growth factor (CTGF) biology to advance innovative medicines for the treatment of unmet needs. The Company is currently developing and commercializing roxadustat, an oral small molecule inhibitor of HIF prolyl hydroxylase activity, for anemia associated with chronic kidney disease (CKD). Roxadustat is also in clinical development for anemia associated with myelodysplastic syndromes (MDS) and for chemotherapy-induced anemia (CIA). Pamrevlumab, an anti-CTGF human monoclonal antibody, is in clinical development for the treatment of idiopathic pulmonary fibrosis (IPF), locally advanced unresectable pancreatic cancer (LAPC), Duchenne muscular dystrophy (DMD), and coronavirus (COVID-19). For more information, please visit www.fibrogen.com.

Forward-Looking Statements

This release contains forward-looking statements regarding our strategy, future plans and prospects, including statements regarding the development and commercialization of the company's product candidates, our clinical programs and regulatory events and those of our partners, and the commercial prospects of roxadustat. These forward-looking statements include, but are not limited to, statements about our plans, objectives, representations and contentions and are not historical facts and typically are identified by use of terms such as "may," "will", "should," "on track," "could," "expect," "plan," "anticipate," "believe," "estimate," "predict," "potential," "continue" and similar words, although some forward-looking statements are expressed differently. Our actual results may differ materially from those indicated in these forward-looking statements due to risks and uncertainties related to the continued progress and timing of our various programs, including the enrollment and results from ongoing and potential future clinical trials, and other matters that are described in our Annual Report on Form 10-K for the fiscal year ended December 31, 2019 and our Quarterly Report on Form 10-Q for quarter ended September 30, 2020 filed with the Securities and Exchange Commission (SEC), including the risk factors set forth therein. Investors are cautioned not to place undue reliance on these forward-looking statements, which speak only as of the date of this release, and we undertake no obligation to update any forward-looking statement in this press release, except as required by law.

> Re: Citizen Petition by Epstein Becker & Green Regarding the Pending New Drug **Application for Roxadustat [Docket: FDA-2020-P-2193]**

Dear Sir or Madam:

On behalf of FibroGen, Inc., I write to strongly object to the November 13, 2020 Citizen Petition titled, "Citizen Petition for FDA to Require Adequate Cardiovascular Safety and All-Cause Mortality Data Be Submitted to FDA for Review Before Approving Roxadustat (FG-4592) for the Treatment of Anemia in Patients with Chronic Kidney Disease (CKD), and Require a Boxed Warning." As detailed in these comments, the above-referenced Citizen Petition is without scientific or legal basis, and bears all of the hallmarks of citizen petitions that are submitted with the intent of delaying competition.

This Citizen Petition was submitted by the law firm Epstein Becker & Green on behalf of an unnamed client. Although the Petition purports to raise concerns based on "recently published data," the cited clinical trial data was presented over one year ago and was disseminated publicly, including at American Society of Nephrology Kidney Week 2019. Soon thereafter, on December 20, 2019, FibroGen submitted to FDA the New Drug Application (NDA) for roxadustat for the treatment of anemia of chronic kidney disease, in both non-dialysis-dependent and dialysis-dependent CKD patients. Now, many months later, and just weeks before the December 20, 2020 Prescription Drug User Fee Act (PDUFA) date for the FibroGen application, Epstein Becker & Green, on behalf of an unnamed client, presumably with a commercial interest, emerges with a spurious critique of the roxadustat data.²

In fact, the purported concerns presented in the Citizen Petition are unfounded and misconstrue the

¹ See Citizen Petition at 7.

² To the extent the Citizen Petition is in fact motivated by competitive concerns, FDA has extensively addressed the anticompetitive impact of citizen petitions in the context of abbreviated and 505(b)(2) new drug applications, and many of the same concerns would apply in this case. Simply put, Epstein Becker & Green's spurious arguments place an unnecessary, last minute burden on FDA by forcing the agency to respond, in a limited period of time, to an incorrect and misleading characterization of data that has long been available to the petitioner. As former FDA Commissioner Scott Gottlieb stated in the generic drug context, citizen petitions submitted to block competitors are an "abuse of this system" and "add to resource burdens on the generic drug review process and the FDA's regulatory decision making." Statement from FDA Commissioner Scott Gottlieb, M.D., on New Agency Actions to Further Deter 'Gaming' of the Generic Drug Approval Process by the Use of Citizen Petitions (Oct. 2, 2018), https://www.fda.gov/news-events/press-announcements/statement-fda-commissioner-scottgottlieb-md-new-agency-actions-further-deter-gaming-generic-drug.

results from a global Phase 3 program encompassing 15 trials that enrolled more than 10,000 patients, worldwide, and which for the US NDA submission included primary analyses from over 8,000 patients. The petitioner is not aware of all of the data and analyses that have been presented to the FDA, and makes erroneous assumptions and claims based on their incomplete understanding of the data.

The Phase 3 program demonstrated that roxadustat is effective in both dialysis dependent chronic kidney disease (DD-CKD) and non-dialysis dependent chronic kidney disease (NDD-CKD) patients. Importantly, the pre-specified primary efficacy endpoint of hemoglobin change from baseline at Weeks 28 to 52 was met in each of the NDD-CKD Phase 3 studies and each of the DD-CKD Phase 3 studies.

Cardiovascular safety of roxadustat was also carefully evaluated, and demonstrated in the Phase 3 program, by assessment of major adverse cardiovascular events (MACE) from pooled analyses of Phase 3 studies. In the MACE analysis of the DD-CKD patient pool, roxadustat demonstrated non-inferiority compared to epoetin-alfa, and in the NDD-CKD pool, roxadustat demonstrated non-inferiority to placebo with respect to MACE.

Moreover, despite the petitioner's erroneous claims, placebo is an appropriate comparator for a study in NDD-CKD, as in the 12 months prior to dialysis initiation less than 15% of CKD patients receive treatment with erythropoietin stimulating agents (ESA), while the average hemoglobin level at dialysis initiation is as low as 9.3 g/dL (USRDS Annual Data Report 2020). With respect to the use of iron supplementation in this population, iron therapy was permitted a concomitant treatment in FibroGen's Phase 3 NDD-CKD studies.

In addition to cardiovascular safety, reduction of transfusion is a fundamental aim of anemia treatment, as transfusion carries with it significant safety risks for the patient. Importantly, in each of the Phase 3 NDD-CKD clinical studies, the proportion of patients requiring red blood cell transfusion was lower in patients treated with roxadustat.

FibroGen's NDA submission was complete, complied with all FDA guidance, and included data from all clinical and preclinical studies. The Integrated Summary of Safety cardiovascular safety report includes the pooled cardiovascular safety analyses of the DD-CKD, and NDD-CKD patient populations. In addition, for completeness and full transparency, FibroGen included certain cardiovascular safety sensitivity analyses, including the stable dialysis subgroup, and the DD-CKD pool including the PYRENEES study. The results from these sensitivity analyses do not change the conclusions with respect to MACE of non-inferiority of roxadustat to epoetin-alfa in DD-CKD patients, and non-inferiority of roxadustat to placebo in NDD-CKD patients.

In conclusion, FibroGen's NDA submission was complete and transparent. The data supporting the safety and effectiveness of roxadustat is robust and compelling. The petitioner is not aware of the contents of FibroGen's submission, and has made several incorrect assumptions and spurious arguments. FibroGen remains committed to developing innovative medicines to address unmet medical needs for patients. Based on the foregoing, we ask FDA to deny the above-referenced Citizen Petition.

Thank you for attention to this important matter. We look forward to continuing to work with FDA during the NDA review of roxadustat.

Respectfully submitted,

R Wayne Frost Digitally signed by R Wayne Frost DN: cn=R Wayne Frost, o=FibroGen, ou=Regulatory Affairs, email=wfrost@fibrogen.com, c=US Date: 2020.12.09 17:22:16 -08'00'

Press Release

« <u>Back</u>

FibroGen Provides Regulatory Update on Roxadustat

SAN FRANCISCO, March 01, 2021 (GLOBE NEWSWIRE) -- FibroGen, Inc. (Nasdaq: FGEN) and its partner, AstraZeneca (LSE/STO/Nasdaq: AZN), today announced that the Cardiovascular and Renal Drugs Advisory Committee of the U.S. Food and Drug Administration (FDA) will hold an advisory committee (AdCom) meeting to review the new drug application for roxadustat in the U.S. The companies have not received a confirmed AdCom meeting date from the FDA.

"While disappointed with the news today, FibroGen and AstraZeneca are committed to working with the FDA to bring roxadustat to patients with anemia of CKD in the U.S. as soon as possible," said Enrique Conterno, Chief Executive Officer, FibroGen. "We continue to be confident in the efficacy

and safety profile of this potential new medicine based on positive results from a global Phase 3 program encompassing more than 8,000 patients."

Roxadustat has been approved in China, Japan and Chile for the treatment of anemia of CKD in both non-dialysis dependent (NDD) and dialysis-dependent (DD) adult patients.

Roxadustat, an oral small molecule hypoxia-inducible factor prolyl hydroxylase (HIF-PH) inhibitor, is the first HIF-PH inhibitor accepted by the FDA for review for the treatment of anemia of CKD.

About Anemia of CKD

Chronic kidney disease (CKD) is generally a progressive disease characterized by gradual loss of kidney function that may eventually lead to kidney failure or end stage renal disease, requiring dialysis or kidney transplant. CKD is estimated to occur in approximately 10-12% of adults worldwide and is predicted to become the fifth most common cause of premature death globally by 2040.

Anemia, a serious medical condition in which patients have insufficient red blood cells and low levels of hemoglobin, is a common early complication of CKD, affecting approximately 20% of CKD patients. Anemia of CKD is associated with an increased risk of hospitalization, cardiovascular complications, and death, and can also cause significant fatigue, cognitive dysfunction and reduced quality of life. Blood transfusions are used for treating severe anemia, however, they may reduce a patient's opportunity for kidney transplant and can increase the risk of infection and/or complications such as heart failure and allergic reactions.

About Roxadustat

Roxadustat, an oral medicine, is the first in a new class of medicines, HIF-PH inhibitors that promote erythropoiesis, or red blood cell production, through increased endogenous production of erythropoietin; improved iron absorption and mobilization; and downregulation of hepcidin. Roxadustat is also in clinical development for anemia associated with myelodysplastic syndromes (MDS) and for chemotherapy-induced anemia (CIA).

Roxadustat is approved in China, Japan, and Chile for the treatment of anemia of CKD in adult patients on dialysis (DD) and not on dialysis (NDD). In Europe, the Marketing Authorization Application for roxadustat for the treatment of anemia of CKD in patients both on dialysis and not on dialysis was filed by our partner Astellas and accepted by the European Medicines Agency for review on May 2020. Several other licensing applications for roxadustat have been submitted by Astellas and AstraZeneca to regulatory authorities across the globe, and are currently in review.

Astellas and FibroGen are collaborating on the development and commercialization of roxadustat for the potential treatment of anemia in territories including Japan, Europe, Turkey, Russia and the Commonwealth of Independent States, the Middle East, and South Africa. FibroGen and AstraZeneca are collaborating on the development and commercialization of roxadustat for the potential treatment of anemia in the U.S., China, other markets in the Americas, in Australia/New Zealand, and Southeast Asia.

About FibroGen

FibroGen, Inc. is a biopharmaceutical company committed to discovering, developing, and commercializing a pipeline of first-in-class therapeutics. The Company applies its pioneering expertise in hypoxia-inducible factor (HIF) and connective tissue growth factor (CTGF) biology to advance innovative medicines for the treatment of unmet needs. The Company is currently developing and commercializing roxadustat, an oral small molecule inhibitor of HIF prolyl hydroxylase activity, for anemia associated with chronic kidney disease (CKD). Roxadustat is also in clinical development for anemia associated with myelodysplastic syndromes (MDS) and for chemotherapy-induced anemia (CIA). Pamrevlumab, an anti-CTGF human monoclonal antibody, is in clinical development for the treatment of locally advanced unresectable pancreatic cancer (LAPC), Duchenne muscular dystrophy (DMD), and idiopathic pulmonary fibrosis (IPF). For more information, please visit www.fibrogen.com.

Forward-Looking Statements

This release contains forward-looking statements regarding our strategy, future plans and prospects, including statements regarding the development and commercialization of the company's product candidates, the potential safety and efficacy profile of our product candidates, our clinical programs and regulatory events, and those of our partners. These forward-looking statements include, but are not limited to, statements about our plans, objectives, representations and contentions and are not historical facts and typically are identified by use of terms such as "may," "will", "should," "on track," "could," "expect," "plan," "anticipate," "believe," "estimate," "predict," "potential," "continue" and similar words, although some forward-looking statements are expressed differently. Our actual results may differ materially from those indicated in these forward-looking statements due to risks and uncertainties related to the continued progress and timing of our various programs, including the enrollment and results from ongoing and potential future clinical trials, and other matters that are described in our Annual Report on Form 10-K for the fiscal year ended December 31, 2020 and our Quarterly Report on Form 10-Q for quarter ended September 30, 2020 filed with the Securities and Exchange Commission (SEC), including the risk factors set forth therein. Investors are cautioned not to place undue reliance on these forward-looking statements, which speak only as of the date of this release, and we undertake no obligation to update any forward-looking statement in this press release, except as required by law.

Presentation

Operator

Ladies and gentlemen, thank you for standing by, and welcome to the FibroGen Fourth Quarter and Full Year 2020 Financial Results Conference Call. [Operator Instructions]. Please be advised for today's conference is being recorded. [Operator Instructions].

I would now like to hand the conference over to your speaker today, Mr. Michael Tung. Thank you, please go ahead.

Michael Tung

Investor Relations Executive

Thank you, Lindon, and good afternoon, everyone. I'm Michael Tung, Vice President of Corporate Strategy and Investor Relations at FibroGen. Joining me on today's call are Enrique Conterno, our Chief Executive Officer; Dr. Percy Carter, our Chief Scientific Officer; Pat Cotroneo, our Chief Financial Officer; Mark Eisner, our Chief Medical Officer; Thane Wettig, our Chief Commercial Officer; Chris Chung, our Senior Vice President of China operations; and Dr. Elias Kouchakji, our Senior Vice President of Clinical Development, Drug Safety and Pharmacovigilance.

The format for today's call includes prepared remarks from Enrique and Pat, after which we will open up the call for Q&A. I would like to remind you that remarks made on today's call include forward-looking statements about FibroGen. Such statements may include, but are not limited to, our collaborations with AstraZeneca and Astellas, financial guidance, the initiation, enrollment, design, conduct and results of clinical trials; our regulatory strategies and potential regulatory results; our research and development activities, commercial results and results of operations, and risks related to our business, and certain other business matters.

Each forward-looking statement is subject to risks and uncertainties that could cause actual results and events to differ materially from those projected in that statement. A more complete description of these and other material risks can be found in FibroGen's filings with the SEC, including our most recent Form 10-K and Form 10-Q. FibroGen does not undertake any obligation to update publicly any forward-looking statements. Whether as a result of new information, future events or otherwise.

The press release reporting our financial results and business update and a webcast of today's conference call can be found on the Investors section of FibroGen's website at www.fibrogen.com. With that, I would like to turn the call over to Enrique Conterno, our CEO. Enrique?

Enrique A. Conterno

CEO & Director

Very good. Thank you, Mike, and good afternoon, everyone, and welcome to our fourth quarter and full year 2020 earnings call. I intend to reflect on my first year as CEO of FibroGen by providing a high-level summary of important accomplishments and developments, not only in recent months, but also for 2020. Pat Cotroneo, our CFO, will then review the financials, after which, we will open the call for your questions.

I continue to be confident in my assessment of FibroGen has a unique opportunity to create significant value for patients and shareholders by executing on our 3 areas of focus: number one, ensuring regulatory and commercial success of roxadustat, a transformational medicine for the treatment of anemia, first in patients with chronic kidney disease and with significant potential for expansion to additional indications. Number two, accelerating the development of pamrevlumab in 3 high value indications, locally advanced unresectable pancreatic cancer, Duchenne muscular dystrophy and idiopathic pulmonary fibrosis. And number three, strengthening our research capabilities to maximize our scientific and medical leadership position in both HIF and CTGF biology. In addition, we are focused on expanding our clinical development pipeline by evaluating both internal and external opportunities to address unmet medical needs.

Today's call will include a review of roxadustat, our continued strong performance in China and our clinical trial programs. Let us get started with the roxadustat new drug application or NDA review. Last December, in the final stages of review, the FDA extended the review period of the NDA by 3 months to review additional analysis of existing clinical data and set a new PDUFA date of March 20, 2020 first. Just today, we were informed by the FDA that they plan to hold as an advisory committee, or Adcom meeting to review the NDA for roxadustat in the U.S. We have not received a schedule for the planned Adcom. We are surprised by the timing of this request. On 3 separate occasions, the FDA indicated they were not planning to hold an Adcom at the time. First, when the NDA filing was accepted, then after the mid-cycle review. And finally, after the late cycle review. It would not be unusual for the FDA to hold an Adcom for a first-inclass new molecular entity. And as communicated last spring, we were preparing for this possibility.

We will now resume those preparation activities and look forward to presenting the comprehensive roxadustat data. We continue to have confidence in the completeness of our NDA submission and the strength of our data and FibroGen and AstraZeneca are committed to working with the FDA to bring roxadustat to patients with anemia CKD in the U.S.

As you can appreciate, it has been the case throughout the final stages of review, we will not be able to discuss the details of our FDA interactions. Our pre-commercial activities continued as planned. FibroGen had its largest presence ever at the American Society of Nephrology Kidney Week conference in October of last year, and there continues to be significant interest in roxadustat from the clinical community. The momentum generated at ASN continues with additional analysis and planned disclosures of our Phase III data in order to maintain our HIF-PHI scientific and clinical leadership position.

Patient and healthcare professional disease education activities are ongoing and expecting to increase through the official launch. Our partner AstraZeneca has a comprehensive renal commercial presence in the U.S. and together, we're committed to make roxadustat available to as many CKD patients as quickly as possible. To optimize patient access, AstraZeneca is leading the discussions with both the houses organizations and payers who cover non-dialysis patients. We have submitted manuscripts covering the Phase III studies for CKD anemia to peer-reviewed journals. As you can see on the slide 5 of these manuscripts have been published, covering nondialysis-dependent, dialysis-dependent and incident dialysis data. Details on these publications can be found in our press release, and we expect additional publications of Phase III data in the coming months.

In Japan, our partner, Astellas, received an additional advance approval for the treatment of anemia CKD in adult patients not on dialysis in November of 2020. In addition, in December of 2020, the 14-day prescription rule was lifted for Evrenzo. As a result of these 2 events, Astellas has seen an acceleration in a Evrenzo's uptake. The European Medicines Agency accepted the roxadustat marketing authorization application for the treatment of anemia in adult patients with chronic kidney disease, both on dialysis and not on dialysis in May of 2020. We expect a decision midyear.

Now -- moving now to China. We're pleased to report net sales of roxadustat of \$29.2 million for the fourth quarter versus \$22.7 million in the third quarter. The total net roxadustat sales in China for 2020, the first year, roxadustat was included in the NRDL, were \$72.5 million. The continuing increase in uptake is being driven by both an expansion in hospital listings and broad adoption within listed hospitals. Hospital listings continue to be a key focus of our launch efforts. Notably, as of the end of the year, roxadustat was listed at hospitals, representing approximately 70% of the CKD anemia market opportunity in China. This is in comparison to 55% at the end of the third quarter. We're driving towards our goal of making roxadustat, the #1 treatment option for anemia CKD patients in China.

We continue to see significant roxadustat utilization across a range of anemia of CKD patient populations. Approximately 60% of patients treated with roxadustat in China are on dialysis, split between hemodialysis and peritoneal dialysis. Within hemodialysis, initial adoption has been in patients who do not respond well to ESAs as well as in incident dialysis patients. The remaining 40% of roxadustat-treated patients are CKD anemia patients not on dialysis. This broad utilization pattern bodes well for long-term success and provides critical earnings as we prepare to launch roxadustat in the U.S. and in other countries. We look forward to keeping you updated as we advance our long-term goal of making roxadustat the standard of care in treating China's CKD anemia patients.

Moving now to our clinical development. On our third quarter earnings call, we provided timeline guidance for most of our clinical trials. We are reiterating that guidance today. And do not intend to update this guidance on a quarterly basis, but it's not only where we have meaningful changes. Starting with roxadustat. We recently completed enrollment in WHITNEY, our Phase II trial in patients with chemotherapy-induced anemia and top line data is expected in the second half of this year. On conclusion of this trial, if successful, we plan to initiate a Phase III program in collaboration with AstraZeneca and Astellas. MATTERHORN, our Phase III travel in patients with anemia of myelodysplastic syndrome or MDS, continues to enroll with top line data expected in the first half of 2022. Finally, we recently completed enrollment of ASPEN and DENALI, two Phase IIIB studies of roxadustat in CKD anemia with large dialysis organizations in the United States.

Moving now to pamrevlumab. In locally advanced unresectable pancreatic cancer, our LAPIS Phase III trial is enrolling well, with top line resection data expected in the second half of 2022. Moving to the Duchenne muscular dystrophy, enrollment continues in our LELANTOS Phase III trial in nonambulatory patients with top line data also expected in the second half of 2022. Finally, in idiopathic pulmonary fibrosis, we recently initiated our ZEPHYRUS-2 Phase III trial in December. IPF patients have severely compromised lung function and the current COVID situation continues to be extremely challenging for enrollment in both our private trials ZEPHYRUS and ZEPHYRUS-2. Despite these circumstances, we have activated a significant number of additional clinical trial sites and expanded geographically, including in China, such that when COVID improves, we should be in a position to accelerate enrollment in both trials expeditiously.

Given the different COVID scenarios, there is variability in our projected IPF timelines and we'll provide you with an update at the appropriate time. Accelerated enrollment of all of our ongoing clinical trials while ensuring patient safety continues to be a top priority.

Now let me touch briefly on the application of our pioneering expertise in hypoxia-inducible factor or HIF, 2-oxoglutarate [indiscernible] and connected tissue growth factor or CTGF biology, in order to advance innovative medicines for the treatment of anemia, fibrotic disease and cancer. In 2020, we completed a thorough internal review of all of our programs, and we plan to continue advancing internal molecules in our development pipeline. In addition, we are seeking to access external innovation.

Finally, it is my pleasure to address another important accomplishment, the hiring of significant leadership talent, which include the appointments of Dr. Percy Carter, as Chief Scientific Officer, Dr. Mark Eisner, as Chief Medical Officer; and Thane Wettig, as Chief Commercial Officer. In summary, 2020 was a productive transitional year and look forward to more progress against our stated goals in 2021.

I will now turn the call over to our CFO, Pat Cotroneo, for the financial update. Pat?

Pat Cotroneo

Chief Financial Officer

Thank you, Enrique. As announced today, total revenue for the fourth quarter of 2020 was \$65 million as compared to \$8 million for the fourth quarter of 2019. The current quarter revenue consists of net product revenues of \$29.2 million for roxadustat sales in China, \$21.5 million in development revenue and \$14.3 million in license revenue related to NDD approval in Japan. For the same period, operating costs and expenses were \$123 million and net loss was \$58.6 million or \$0.64 per basic and diluted share as compared to operating costs and expenses of \$108.4 million and a net loss of \$98.1 million or \$1.12 per basic and diluted share for the fourth quarter last year.

Included in operating costs and expenses for the quarter ended December 31, 2020, was an aggregate noncash portion totaling \$26.9 million, of which \$20.3 million was a result of stock-based compensation expense as compared to an aggregate noncash portion of \$22.1 million of which \$17.4 million was a result of stock-based compensation expense for the same period in the prior year.

At December 31, FibroGen had \$732.1 million in cash, cash equivalents, restricted time deposits, investments and receivables. At this time, I would like to outline some changes in financial reporting starting next quarter that result from the amendment to our China agreement with AstraZeneca. As we have previously reported, the amendment is expected to result in earlier and more consistent profitability

to FibroGen based on a continued 50-50 profit share with AstraZeneca. Under the amendment, we have formed a jointly owned distribution entity, the JDE, that began operations in Q1 2021. The JDE will be responsible for selling roxadustat to distributors and will pay for AstraZeneca's commercialization efforts in China and AZ's portion of profit share.

Previously, FibroGen was responsible for these items. The JDE is expected to account for over 95% of overall China roxadustat sales volume going forward. While the rest will continue to be conducted directly by FibroGen.

Starting in Q1 2021, FibroGen's revenue will be based on sales to the JDE at a transfer price as well as FibroGen's direct sales. The transfer price is expected to be in the range of 30% to 45% of JDE net sales, which reflects the JDE paying both AstraZeneca's commercialization expenses and AstraZeneca's portion of the profit share. In addition, to continue to provide context for the operating results of our roxadustat business in China, we also plan to share the overall net sales of roxadustat, i.e. the combination of end sales by AstraZeneca and end sales by FibroGen. Looking ahead, at our broader financial picture, we have a total of \$245 million of potential milestones expected this year for anticipated U.S. and EU approvals and first commercial sale in the U.S.

At this point in time, we have no changes in expectations in any of the anticipated milestones between now and the end of the year. Based on our latest forecast data, we estimate our 2021 ending balance of cash, cash equivalents, restricted time deposits, investments and receivables to be in the range of \$660 million to \$670 million, assuming U.S. and EU approval in 2021.

Thank you. And I would now like to turn the call back over to Enrique.

Enrique A. Conterno

CEO & Director

In closing, this is an important time for FibroGen. Roxadustat has launched in China, Japan and is under regulatory review in the U.S., Europe and other geographies. Pamrevlumab a wholly owned potential first-in-class new medicine. In Phase III developing the 3 value indications of locally advanced unresectable pancreatic cancer, Duchenne muscular dystrophy and idiopathic pulmonary fibrosis. We are re-energizing our research agenda to deliver on our unique scientific expertise. In parallel, we're building world-class research capabilities internally while also looking externally for opportunities. With the goal of expanding our pipeline of innovative drug candidates.

We have strengthened our leadership team, which will be instrumental for our strategic growth. We are in a strong financial position as roxadustat sales ramp up with approximately \$732 million in cash and another \$245 million in anticipated roxadustat milestone payments expected during 2021. Looking forward, I believe we're clearly positioned for success.

Now I would like to turn the call back to the operator for questions.

Question and Answer

Operator

[Operator Instructions]

Your first question comes from Joe Beatty from Citi.

Joel Lawrence Beatty

Citigroup Inc., Research Division

The first one is, are you able to share anything about the topics that you're preparing to address at the Adcom?

Enrique A. Conterno

CEO & Director

Thank you, Joel. Let me provide just a brief answer. I'm going to ask also Mark Eisner to comment. But clearly, at this point in time, we're not in a position to provide an update on that. As you know, there's typically a report that the FDA will basically make public prior to the Adcom. That's only a few days before the Adcom is actually held. We don't have a set date for the Adcom at this stage. And we do not provide to comment on our regulatory interactions with the FDA. Mark, I'm going to ask Mark Eisner, if he has any additional comments.

Mark Eisner

Chief Medical Officer

Yes. No, and thanks for the question. As you know, the FDA uses advisory committees to bring in external scientific, clinical or other perspectives into its review. And it would not be unusual to have an Adcom for first-in-class new molecular entity, in this case, what's surprising is the timing, as Enrique had alluded to in his introductory comments. At this point, we're going to resume our preparation activities for the advisory committee and we look forward to presenting the comprehensive roxadustat program and its data. We continue to have confidence in the completeness of our NDA submission, the strength of our data and along with our partner, AstraZeneca, we're committed to working together with the FDA to bring roxadustat to patients with anemia of CKD in the U.S. So thanks again for the question.

Joel Lawrence Beatty

Citigroup Inc., Research Division

And then maybe one follow-up to that. Can you share anything about how you and AstraZeneca collaborate for the Adcom preparations? And if there's one company taking the lead?

Enrique A. Conterno

CEO & Director

Yes. This is really a -- it has been a joint effort and joint process. Clearly, AstraZeneca has considerable expertise when it comes to Adcoms and we need to make sure that, that is being fully leveraged. But I think the -- when we were preparing back in the spring, that was the case, very collaborative. I expect that it will continue to be very much a joint effort.

Operator

Our next question comes from Michael Yee from Jefferies.

Michael Jonathan Yee

Jefferies LLC, Research Division

Two questions for you guys. You can understand that people are, I guess, confused and a bit perplexed by the timing and also just the chronology of how things are played out. So the first question is just, maybe, Enrique, can you just give us some comfort such that the discussions here or the debates or the issues

here are more of a labeling and black-box safety scenario question, such that whatever happens here, you don't believe that peak sales are likely to change too much? You've kind of made that comment before, but maybe you could comfort us in some way.

The second question is more of a logistical question for the team. I think that you can't really have 2 formal PDUFA extensions if you go look at documents. So do you just expect that we're going to pass the PDUFA date, how to deal with an Adcom? And then we just kind of go from there? Or do you expect that PDUFAs would actually be formally changed? So we would have some visibility on things?

Enrique A. Conterno

CEO & Director

Yes. Thank you for your question, Michael. Clearly, I think -- let me try to address maybe the first part -- the last part of your question. Our understanding is that the PDUFA date can be extended once that extension happens. So at this point in time, we expect that the PDUFA date will be missed. And therefore, we will have the Adcom at some point in time, but with no longer basically an active PDUFA date.

I think your next your -- the first part of your question was related to being more specific on the nature of the Adcom, clearly, when it comes to Adcoms, Adcoms are looking at the overall benefit risk profile of the product, of course, they try to get external scientific expertise to bear but I'm not in a position to be able to comment on the nature of that. And I think we have to prepare for it and I -- we want to see, of course, when this Adcom will be scheduled, we don't have a set date for it at this time. Keep in mind that we were notified of this today.

Operator

Your next question comes from Edwin Zhang from H.C. Wainwright.

Xiaodong Zhang

H.C. Wainwright & Co, LLC, Research Division

First one, how much do you think is this Adcom decision related to the new analysis you submitted to the FDA 2 months ago? And the second, just a follow-up on the PDUFA date. Just to clarify, are you going to get a new PDUFA date from the FDA or not? And when are we going to know the new PDUFA date, if there's one?

Enrique A. Conterno

CEO & Director

Yes. Yes. We don't believe there would be a new PDUFA date, given that there was already an extension. And I'm sorry, I missed the first part of your question.

Xiaodong Zhang

H.C. Wainwright & Co, LLC, Research Division

So how much do you see this Adcom decision from the FDA is related to the new analysis you submitted to the FDA 2 months ago?

Enrique A. Conterno

CEO & Director

Yes. We don't want to speculate.

Xiaodong Zhang

H.C. Wainwright & Co, LLC, Research Division

Okay. May be one more. Does this regulatory decision change your expectation of a clean or differentiated label compared to ESAs?

Enrique A. Conterno

CEO & Director

Yes. Listen, I think at this point in time, we have to go through the Adcom. We have a product with significant amount of clinical data. Keep in mind that our pivotal data for the U.S. included over 8,000 patients, we discussed that clinical data at length, we continue to stand behind our data and the strength of the data. Some of the data now has been published. There are 5 primary manuscripts that have been published, and a number of more that are upcoming. But at this point in time, I don't want to speculate on the nature of the Adcom. We very much look forward to have the opportunity to share the roxadustat data in a public forum.

Operator

Our next question comes from Geoffrey Porges from SVB Leerink.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

A number of questions related to this topic. First, Enrique, you're answering a lot of these regulatory questions. It would be helpful if the official regulatory representative for FibroGen could answer the questions. But why doesn't this amount to a complete response letter to your application? And particularly given the amount of time it's going to require to prepare a full company package and the FDA's package. It would seem certain that it's going to be much more than 30 days after the prior PDUFA date.

Secondly, it's going to certainly be hard for us and investors to be confident in your approval since -- as far as we know, you've replaced most people in the organization who are familiar with the very extensive amount of clinical data. And then lastly, could you confirm whether this review or whatever the Adcom is going to be, will it be held by the hematology division or the cardiorenal division, and will it be examining and hearing the objections from the citizens petitions?

Enrique A. Conterno

CEO & Director

Yes. So let me try to address some of your questions, but I am going to also ask Mark Eisner to maybe make some comments that he has formal -- as a Chief Medical also has regulatory responsibilities. First, this -- the advisory committee, we believe, is going to be the cardiorenal advisory committee. So that's how we understand it based on the communication with the FDA, which happened today. We -- I think you are making reference to Peony Yu's retirement as Chief Medical Officer. Keep in mind that Peony is still an employee of FibroGen at this stage. And she also has an agreement -- a consulting agreement over the next 6 months post her employment at here, at FibroGen to continue to provide advice. I feel that the strength of our team is considerable when it comes to roxadustat data, not just here at FibroGen but also AstraZeneca. And then I'm going to ask Mark Eisner to also provide some additional comments or add to what I'm sharing.

Mark Eisner

Chief Medical Officer

Yes. Thanks, Enrique. So the FDA did not issue a complete response letter. A complete response letter would indicate that the FDA had completed its review, the FDA review of our NDA is continuing and ongoing. And the FDA wants to have an advisory committee in order to bring external expertise, clinical, scientific and otherwise, into their review so that they can complete their review.

So it's a very different scenario to get an advisory committee compared to a complete response letter. I mean, to address the specifics of your timing, yes, it's a little late in the game under -- in the review process to get a request for an advisory committee, but the FDA is well within its rights and regulations to request an advisory committee at any time. And we're very willing and able to have this discussion in public and present our data, which, as we alluded to before, we're quite confident in.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

Mark, sorry, was this a change in the reviewing division, though, from the heme to the cardiorenal?

Mark Eisner

Chief Medical Officer

There was no change in the reviewing division. No.

Operator

Your next question comes from Annabel Samimy from Stifel.

Annabel Eva Samimy

Stifel, Nicolaus & Company, Incorporated, Research Division

I promise I won't ask about the Adcom because it doesn't seem like you can answer many of them, but maybe we can talk about some of the signals that you're getting ex U.S. Obviously, sales and churn are going well. The mix of sales dialysis to nondialysis is improving. Japan was approved in nondialysis, even the French issued temporary use authorization with treatment up to 12 grams per deciliter. So how should we read these signals abroad? And how can that help you and frankly, help you with the FDA to move this process along, can you draw from all of that information that is being generated globally? And given some of the movement that we're seeing in China, are you still assuming a \$500 million opportunity in China? Or is that a moving target?

Enrique A. Conterno

CEO & Director

Yes. No, I think what we said is that -- and we're very excited by the way, with the way our China business continues to progress. We have stated that we view the opportunity in China to be able to reach for roxadustat to be able to reach peak sales north of \$0.5 billion. It is pretty clear that the launch continues to go very well, and we expect continued growth in China as we look at 2021. So we're very excited about that.

We are -- indeed, we, of course, conduct pharmacovigilance activities in both China and Japan, where the product is launched. And we -- as you mentioned, we need to make this also matter when it comes to the average that we basically have and how the acceptance and adoption and the utility that the patient basically has in the countries where we're launching. So I think this is an important factor, of course.

Operator

Your next question comes from Jason Gerberry from Bank of America.

Jason Matthew Gerberry

BofA Securities, Research Division

Just from a timing perspective, just so as we think about potentially modeling the timing implications here. So it sounds like it's a moving target with at least a 55-day notice period when they'll let you know in terms of timing from that to an Adcom. So I would assume at least could be, say, 3 to 6 months as a delay here. I'm not sure if you want to comment on those timing considerations. And I realize it's been a very short amount of time since you've had to digest this information, but any analog situations that you may have looked at or come aware of as it pertains to a novel mechanism and anything that might give you or us some sort of comfort as it pertains to this situation in general?

Enrique A. Conterno

CEO & Director

Yes. No. Thank you very much. We are, quite frankly, in unprecedented territory when it comes to having had an extension and then within the sanction period now, having an Adcom, clearly not a good situation from a timing perspective. We don't question the possibility or the wisdom of having an Adcom, in fact, we had very much shared that we were preparing for that back in the spring, but it -- an Adcom was not called. So now we find ourselves very late in the process. And at this point in time, we have to look forward to try to prepare, in the best way possible, to ensure that we can have the most successful Adcom possible and sharing all of our data and why we have the confidence that we have on roxadustat.

So I -- we will be looking, of course, at other types of examples and so forth and learning from that as part of the Adcom preparation. I don't know, Mark Eisner, if you want to add anything to what I said.

Mark Eisner

Chief Medical Officer

No, I think you summarized it well, Enrique. I mean we don't know the data, the Adcom yet. So it's difficult to speculate on the exact time frame, but we'll be preparing carefully. We'll be ready for the discussion. And we actually welcome the input from nephrologists and the external medical and scientific community, just the timing is surprising.

Operator

Next question comes from Yaron Werber from Cowen.

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

So Enrique, I just have maybe a couple of questions. Number one, I was under the impression that the original NDA was sent to hematology. So is it that hematology asked cardiorenal for advice and the cardiorenal Adcom was called just so we -- it sounds like they didn't send the application across to a different division, but it sounds like they're calling an Adcom from another division and not totally surprising given that division has experience, at least with ESAs.

And then secondly, as you think about OpEx and for this year -- and I know you don't give guidance, but can you give us a little bit of a sense what's going on with -- IPF is a little slow because of COVID, but just a little bit, how do we think about OpEx?

Enrique A. Conterno

CEO & Director

Yes. So yes, your understanding is also the understanding that I had on both hematology and renal. They are both under the same overall leadership at FDA, but we were informed today that that cardiorenal would be the one basically conducting the Adcom or hosting the Adcom.

Sorry, I missed your -- the second part of your question was related to COVID. Were you asking about operating expenses?

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

Exactly. Just -- some of the R&D would have been IPF-related, but that's slower to ramp. So just how do we think about the OpEx for the year overall and maybe a little bit of R&D?

Enrique A. Conterno

CEO & Director

Yes. We, of course, have -- are looking at our operating expenses. We do this as a matter of discipline. Whenever we had even the 3-month extension, I asked for an overall review of operating expenses. And given that we were going to be launching roxadustat later, now we need to undergo a similar process now that we have a further delay. So clearly, when it comes to pam, we're trying to enroll as quickly as we can, but we need to be thoughtful about every single expense here at FibroGen. We do have a good balance sheet and a good position, but we need to make sure that it's invested in the things that can add the most value at all times and continue to have operating discipline anytime things and some of the assumptions change.

Operator

Our next question comes from Andy Hsieh from William Blair.

Tsan-Yu Hsieh

William Blair & Company L.L.C., Research Division

Copyright © 2021 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

I'm just wondering, high level, heading into the Adcom, what's your confidence level, right? So basically, before it's kind of a two-party interaction between you and the FDA, the renal cardio division. And now they're bringing a third party, external experts, kind of democratizing the process. So maybe comment on the confidence level and the ability for you to kind of highlight the data in that avenue. And also for the preparation for incident dialysis, is that kind of a separate population that you would want to kind of single out during the presentation?

Enrique A. Conterno

CEO & Director

Yes. Clearly, I won't be sharing what are we planning to present and so forth, but you can imagine, of course, the data that we have on incident dialysis, we believe, is some of our strongest data. As we think about MACE and MACE+ significance in that population. So clearly, very, very important data. I -- what I would share, I think you talked about democratizing the processes, transparency. But I think it's also a good opportunity to get the external community, including nephrologists, patient advocates to opine about some of the needs out there. And I think, honestly, I think in that way, I think this -- the Adcom could be refreshing to be able to hear some of the interest that the clinical community has on the product.

That's what we hear, basically, whether it's at ASN, either directly shared comments, but also how you -- how interested people are in the different presentations that we had, whether were oral presentations or posters at ASN. So I look forward to the full engagement of the scientific community. So that's the perspective that I would provide.

Operator

Your next question comes from Paul Choi from Goldman Sachs.

Aliza Bram Seidenfeld

Goldman Sachs Group, Inc., Research Division

This is Aliza on for Paul. A quick one on the Adcom for us. It seems like previously the FDA was reviewing roxa in terms of both the DD and NDD populations together. With the new news on the Adcom, are you guys still expecting a similar review? Do you have any indication that the agency might review these populations and/or indications more separately? How you're thinking about that would be great.

Enrique A. Conterno

CEO & Director

Yes. I will have Mark Eisner maybe comment and respond to that question.

Mark Eisner

Chief Medical Officer

Yes. So it's a great question. Thank you. We can't really obviously share the details of the FDA's overall intent because we don't want to speculate. But we're very confident in our data for both populations. I mean the data are the same today as they were yesterday, and we had the FDA tell us today about the Adcom. So we continue to feel very confident in the data. And as Enrique said, I think it's actually, although the timing is unfortunate, it's a great opportunity to really hear from the community, whether they be patients and their advocates, nephrologists, so the clinicians about how important and innovative this product is and can be for patients. And there's been very little innovation in this space over the past 30 years for CKD anemia, and we really believe the roxadustat can provide really significant clinical benefit to patients in both populations. So we're looking forward to that discussion in the public venue.

Operator

Our next question comes from Difei Yang from Mizuho Securities.

Difei Yang

Mizuho Securities USA LLC, Research Division

So just 3 quick questions. One, I apologize if I missed that. Will you be -- are you expecting the 55-day prep time leading up to Adcom? Or will it be shortened in some fashion?

So then the second question is that, would you have the option to call back CMO for this Adcom? Or do you think she will not be there?

Then the third question is with regards to EMA, I think you have said you're still expecting decision midyear 2021. I'm wondering if you are able to give us a little bit more detail between now and approval, what other things needs to happen?

Enrique A. Conterno

CEO & Director

Yes. I'm going to have Mark Eisner respond to these questions, and I'll complement his answers.

Mark Eisner

Chief Medical Officer

Right. So in terms of your first question about the 55-day prep time, the FDA has not provided us a date for the advisory committee. And as soon as they do, we'll be able to communicate that, but we would assume that they're going to conform to their typical practices. In terms of calling back the CMO, Dr. Peony will continue to be working as a consultant for us for the next 6 months. So we'll have access to her expertise. And remember, the expertise on this product, although Dr. Yu is very expert, is deep and broad within both FibroGen and AstraZeneca. So we're very confident that we will be able to bring a very appropriate and invigorated discussion at the time of the Adcom. And then in terms of the EMA, yes, there's been no change to our expectations around the midyear approval for roxadustat in the European Union.

Operator

All right. At this time, I would like to turn it back to the speakers for further comments. I'm showing no further questions at this time. Please go ahead.

Enrique A. Conterno

CEO & Director

We appreciate everyone's participation in today's investor call and your interest in FIbroGen. Please follow up with our Investor Relations team if you have any questions we have not addressed on the call, and enjoy the rest of your day. Thank you.

Operator

Ladies and gentlemen, this concludes today's conference call. Thank you for participating. You may now disconnect.
